hold that science was powerless to assign dates to ancient weapons or works of art. Of museums they said, as Clough said of Rome, "rubbishy seems the word that most exactly would suit them."

The English Universities and English students in general have awakened out of this sceptical lethargy. It has been acknowledged that there is as much and as authentic history in inscriptions and artistic remains as in written books. It is perceived that the Greek spirit was not a thing which existed for three or four centuries and inspired about a score of orators, philosophers, and poets, but an influence of immense antiquity, of perennial and still living force. "Hellenic Studies" are acknowledged to include in their range objects older than Homer, Byzantine historians, and Romaic popular minstrelsy. The Society for the Promotion of Hellenic Studies has therefore been founded in England, and seems to be fairly prosperous. The names of the members fill nearly ten closely printed pages. The learned Bishop of Durham is President of the Society; among the Vice-presidents we note the names of Mr. Newton, the Dean of St. Paul's, and the Master of Trinity, Cambridge; while not only Mr. Oscar Browning, but also Mr. Oscar Wilde, lend their assistance to the Council. The *Journal* of the Society is, as far as we are aware, the only English periodical exclusively devoted to classical archæology. Greece, Italy, Russia, France have their archæological journals, popular or scientific, cheap or expensive and elaborate. England has only to-day started a serial of this sort; but the attempt seems in many ways promising, if not absolutely satisfactory. We do not propose to review all its contents, but a short account of them will show the width of range, the variety, and, generally speaking, the spirit of the collection. The literary matter is presented in a large octavo *format* of more than three hundred pages. The illustrations, of which we shall have more to say, are printed in a separate folio. This plan has its advantages and its disadvantages. The inconveniently wide page of journals like the *Gazette Archéologique* and the *Portfolio* is avoided. On the other hand, it is not always pleasant to have to turn from the printed volume and hunt through the folio for the illustrations. On the whole, the Society has probably chosen the smaller of two evils. An ideal publication would perhaps be in folio *format*, the illustrations stitched with the letterpress, which should meander, in lines of the present length, through a vast snowy expanse of margin. Text and pictures would thus be presented together, and yet the text would not have the tediously long lines of the *Portfolio*.

The first article is by Mr. Newton, and to this we propose to return, as it contains a brief and sufficient statement of the purposes and prospects of the Society. Professor Jebb follows with an exhaustive and most interesting paper on the holy Isle of Delos, where the huge fetish stone in the primitive shrine of Apollo has not long ago been discovered. Mr. Jebb thinks that the grotto on Mount Cynthus was a primitive temple, whoever the people may have been that worshipped there, "It shows the very genesis of the early temple from step to step. First an altar in the open air; then a roof to shelter the altar; next, a door to keep out the profane; lastly, a precinct added to the house of the god." Mr. Jebb's article is not less remarkable for the pleasant quality of its style than for the industry of its research and the systematic arrangement of the results of recent French inquiries. Mr. Ramsay, the newly elected travelling scholar in archæology, contributes learned papers on Smyrnæan remains and on Pamphylian inscriptions. Mr. Ramsay's work is the first-fruits of a scholarship of recent creation, and he is the accomplished leader of many young Englishmen who, as the years go by, will follow him into Greece and the Levant. Professor Sayce gives some notes of travel in Lycia and the Troad, where he kept a sharp look-out for Hittite and other figures remarkable for wearing boots turned up at the toes. Mr. Murray's paper on the Erechtheum, a very business-like article, is as much too short as Mr. Verrall's philological remarks on "Ionic Elements in Attic Tragedy" are, we fear, too long; and Mr. Verrall's paper is to be continued. Modern Greek life is illustrated by ballads, commented on by Mr. Tozer and Mr. Ramsay. Mr. Percy Gardiner, in a masterly article on the "Tombs of Mycenæ," puts to rout the remarkably flimsy and illogical theories of M. Stephani, who wants to attribute to the Mycenæian tombs a Herulian origin, and the date of the third century of our era. One of the most important papers is that in which Professor Colvin discusses the myths about the Centaurs, and the mention of his long and learned essay brings us to the illustrations. These are of very various qualities. The best of all (Plate IV.) is a delicate copy in colours of a very beautiful vase in the British Museum. Chiron, the old Centaur, is receiving the child Achilles as a pupil. The Centaur's dog runs forward to meet the man carrying the infant. A more archaic representation of Centaurs fighting, armed with boughs of trees, is curious and comic in effect. The Society does a service to Greek study by publishing at very considerable cost vases which would otherwise only be known to visitors of our Museum. Many of the little woodcuts in the text, especially the copies of very archaic gems, have a curious interest as illustrations of early Greek notions of the grotesque.

Enough has been said to show the nature and range of the studies of the Society. Vase-painting, sculpture, history, popular poetry, architecture, philology, all receive the attention of capable contributors. We must now turn to Mr. Newton's account of the prospects and purposes of the Society. He refers to "that great hope which has inspired so many generations of scholars—the hope that all the missing literature of Hellas is not lost for ever. It is known that the plays of Menander were in existence down to the time of the Renaissance; and, before the Turks seized the library of the King of Hungary, Brassicanus saw in that place of Paradise (as it seemed to him) the works of Hyperides. The Turks are no lovers of books, and what they stole may have gone the way of the Squire's library, as described by the village wife in Mr. Tennyson's new poem. But Mr. Newton says that "the monasteries of the Levant are full of Greek MSS. which as yet have been very imperfectly restored. Who shall say what interesting matter may be found in these repositories, on which the dust of many centuries has gathered undisturbed?" Mr. Newton has no sanguine hopes of unearthing Greek classics; but "Greek lexicons and scholiasts, full of instruction to the scholar," are not to be despaired of. M. Piron thought he had discovered a wonderful Homer not long ago, but the veteran and short-sighted scholar was mistaken. Biblical and Patristic MSS. are also, Mr. Newton thinks, in the monasteries. The eminent Latinist who, on hearing of a fresh MS. of the New Testament, said, "Ah! if it had only been something important—Catullus, for example!" will be little rejoiced, we fear, by the appearance of a wilderness of Patristic literature. The history of the Frank domination of the Levant is almost certain to be illustrated by records in the libraries of the monasteries. The pursuit of unpublished Greek inscriptions will probably be found less difficult by the Society than the gaining of an entrance into the monasteries of the Levant. At present, any remarks which the traveller may make about MSS. awaken more or less distrust. But Mr. Newton holds that "many doors of monastic libraries, at which ordinary travellers might knock in vain, would open readily if a pressure, a very gentle pressure, were applied by a Greek patriarch." The object of the Society, then, should be to "get at" a patriarch, and then organize a scheme of thorough search in the homes of the monks of the Levant. A thorough search in our college libraries in England would reveal some curious facts about collegiate indifference to books. We can hardly expect the Eastern brethren to know more about their own old libraries than do the Fellows of St. Boniface. When found, the new MSS. will be made a note of, if possible, and published by the Society. It is a non-political body, and many of its members are, no doubt, sympathizers with the gallant but unfortunate Turk. This may render it less easy for the Society to make friends with Greek patriarchs, and so to pursue its labours among the dusty dungeons in which manuscripts lie blue-moulded for want of a publisher. But it is doubtless well, considering the ferocity of temper which everything at all connected with the Eastern question provokes, that the Society for encouraging Hellenic Studies is not a Society for aiding and abetting Hellenic patriots. The Greek Committee and Mr. Arthur Arnold, M.P., suffice for that end. Indeed the good Society is the steady friend of peace, and would rather send Mr. Oscar Browning out to make a pacific naval demonstration in an outrigger than encourage the firing of a gun within range of the Parthenon and of the Athenian Museum. Thus we may wish all good fortune to a learned and energetic body which has not been founded at all too soon. If we might address a warning to the Society it is to implore it not to spend too many of its guineas in illustrations, while it should by no means contemplate the idea of purchasing and fitting out an æsthetic steam-yacht for the amusement of its idler members.

RES HIBERNICÆ.

ONE of the four Irish Judges who have just drawn up such terrible articles of impeachment against Her Majesty's Ministers observed the other day that the English people were slow to rouse, but that, when they were roused, they were not to be trifled with. It is to be hoped that the latter part of the statement is true; the former certainly is. We do not say that the scandalous condition of things in Ireland is regarded in England with apathy, but it must be obvious that it has hitherto produced far less effect than might have been anticipated. Most of the more important organs of public opinion have indeed, on the whole, spoken as it became them to speak; and, at least in educated and respectable society, difference of political principle is no bar to the existence of an almost entire unanimity of opinion on this point. But, as if to give us another proof that educated and respectable society no longer counts for what it used to count for in England, the general tone of the public meetings of the Liberal party on the subject has been by no means what could be wished. Few speakers, indeed, have equalled the harebrained folly of Sir Wilfrid Lawson in declaring for "separation" in preference to "subjugation," and few audiences have had the opportunity of even pretending approval of this sort of nonsense. But it is remarkable that, with certain honourable exceptions, the unwise and immoral motto of "concession hand in hand with coercion" has been generally propounded, and has generally been received, if not with enthusiasm, at any rate without immediate disapproval. The irresponsible adventurers who have in so many instances taken in the present Parliament the place of better men have thus been encouraged to profess and to adhere to their agreement with it. This being the case, it can be hardly superfluous to state once more a few of the points involved in the matter, and there are two points which at the present moment seem specially to invite such treatment. It is indeed sometimes said by persons whose judgment and opportunities of observation are not contemptible, and who have no party

reasons for depreciating the character of the majority which returned Mr. Gladstone to power, that the English working classes are rather pleased than otherwise at the misfortunes of the Irish landlords, and have no desire to discourage friends. This, however, serious as it is if true, is hardly a matter for discussion. There are two points which do seem to be matters for discussion. The one is the common fallacy, entertained, it is believed, or at least professedly entertained, by members of the Government themselves, and constantly inculcated by Radical organs, that the present anarchy and misrule of Ireland are largely the fault of the orderly classes, or of the magistracy, or of the police. The other is the already mentioned idea, as startling in its immorality as amazing in its want of common political prudence, that coercion and concession must go hand in hand.

The argument as to the supineness of the partisans or officers of the law takes various forms, ranging from not unplausible fallacy to contentions which can only be the result of the extremest dulness or of deliberate sophistry. It is quite true that there is something at first surprising in the readiness with which persons, some of whom at least must be well-meaning and inoffensive enough, render themselves accessories to the most atrocious crimes. The tenants who rob their landlords at the dictate of an association composed, in the first place at any rate, of a riff-raff of political adventurers, Irish-American rowdies, and priests who wish to recover in this agitation the influence their order lost by its opposition to Fenianism, do not present a very pleasing spectacle. The shopkeepers who refuse to supply, and the labourers who refuse to assist, those who are under the ban of this maleficent but, in its origin at least, insignificant, power do not cut a heroic figure. It may even be said by persons who sit comfortably at English firesides, and sink peacefully to rest at night, prepared to be indignant with the police if they should find in the morning that a flower or two has been stolen out of their front gardens, that the landlords themselves have waited for their fate with a somewhat remarkable passivity. They have, it is said by their foes, attempted no counter-organization; though how counter-organization could stop short of Vigilance Committees —or, indeed, of the full proposal by which poor Mr. Kane drew down such vials of wrath on his head—it is not easy to see. Everybody is indignant, and justly so, at the conduct of the great Steamship Companies, who refused Mr. Bence Jones's cattle, and whose opposition to the embarking of Boycotted beasts was clearly induced by the most selfish and, what is more, shortsighted, cowardice. All this is very well to say. But, in the first place, it seems a little cool to demand from the inhabitants of a professedly civilized country the same rough virtues which are needed in a squatter or trapper of the wilds. Civilized men are trained not to take the law into their own hands, and, as has been already remarked, the proposed activity and counter-organization mean nothing but taking the law into their own hands. At present the Irish loyalist, whatever his rank, is between the devil and the deep sea. If he opposes the commands of the Land League, he will probably be shot, and almost certainly ruined; if he in his turn shoots a Land Leaguer, he will probably be hanged. The recent trials at the Assizes have shown beyond doubt—what indeed every one knew before—that convictions cannot be depended upon against the Land Leaguers, even when the evidence is perfectly clear. Such a case as that of the fellow Manning, who went into the witness-box and denied on his oath that he was intimidated by undoubted intimidation, may be said to render further argument about the sufficiency of the ordinary law unnecessary and childish. The force of terrorism can go no further.

In the face of such things as these, and of the actual outrages which occur from time to time, when every one in Ireland out of the large towns, and even in them if he be obnoxious to the Land League, lies down at night in terror of his life and wakes in the morning (to use the national idiom) astonished that his throat is not cut, it is sheer nonsense to talk about passivity and absence of organization. The victims are simply terrorized and fascinated. In the case of the half-unwilling participators terrorism accounts for much, self-interest for more. Heroic virtue may induce a man to pay his debts at the risk of his life and fortune, but nothing short of heroic virtue. As to the supposed remissness of the police and the magistrates, it is here that dulness or dishonesty alone can explain the charge. To begin with, what with witnesses who will not give evidence, and juries who will not convict, policemen and magistrates are simply powerless. All the constabulary in Ireland would, moreover, not suffice for the work which the fanatical devotees of the ordinary law would have them to do. But, finally, it must be sun-clear to any one who does not wilfully shut his eyes that the obstinate reluctance of the Government to interfere has paralysed their subordinates. In the United Kingdom the public service is a body corporate, in which influences run very rapidly from the nerve-centre to the extremities. The magistrate or the policeman who acted vigorously with the fact before him that the Castle, and the Castle's masters in London, minimize, disbelieve, pooh-pooh, temporize with the agitation, would be either a hero or a fool. We are ourselves perfectly certain that the ordinary law is not sufficient—that nothing but extraordinary measures will give to witnesses and to juries, and to the great mass of the easily-swayed Irish people, the courage to be on the side of the law instead of on the side of the League. But let us admit for argument's sake that the ordinary law method was worth trying. In that case a really vigorous Government, desirous to put down and not to nurse the evil, would have done twenty things that Mr. Gladstone's Government has not done. Every sheriff's officer, process-server, and the like would have been accompanied by detachments of armed men, with a promise of indemnity to the commander whatever should happen; every illegally-built house for evicted tenants or League care-takers would have been at once demolished; every attempt to carry crops would have been dispersed by force. Boycotted houses would have had communication opened with the nearest police or military barrack, rations sent in, with soldiers, if necessary, to do pressing work, and an ample escort guaranteed for imported labour—not, as in Captain Boycott's case, as a damper to the enterprise, but as an encouragement to it. A troopship would be sent to take up Boycotted cattle and produce at the ports. In short, a plan which any senior clerk of moderate ability in the Secretary's office could elaborate in a morning, which could be corrected in an afternoon, and set to work next day, would be arranged. Has anything of this sort been done? Clearly, then, the police are simply paralysed by the Government, and the Government alone is to blame.

If, however, this argument about the passivity of the well-meaning classes is untenable and absurd, it is at least not open to the charge of positive immorality. To this the Government plan, as openly avowed by themselves and approved by their authors, is most certainly open. That "concession must accompany coercion" means, in plain language, that the Government is going to sell justice. It will protect the Irish landlords and well-meaning Irishmen of all classes from murder, from outrage, from robbery, if they will pay for it. Otherwise it will not protect them. "We will deny to all men, and delay to all men justice, so long as it suits our purposes," say the Ministers of the Crown; "we will sell it to them when it suits us at the price of a portion of their goods and of the popularity we shall win with the extreme men of our party." This new Magna Charta is not the distorted invention of an opponent; it is the plain, unmistakable meaning of the Government programme. To put upon the same footing the safeguarding of the ordinary rights of citizenship—the right to live unmolested, to enjoy one's own, to buy and sell freely—and the settlement of such a question as the present controversy about the policy or impolicy of the prevalent tenure of land in Ireland, is a moral obliquity so enormous that probably cynics would say none but a Ministry who rode to power on a moral high horse could be guilty of it. Let us again, for the sake of argument, admit that everything which commends itself to respectable English or Irish opinion on the side adverse to the landlords is the fact. Let us go further, and admit that the three F's *e cœlo descendunt*; that absenteeism is not merely a moral wrong, but a civil delinquency, deserving fine; that "duty-work" comes from the devil, and that Griffith's Valuation is a law of nature. There would still remain the unalterable fact that, if any Irishman does not like the land laws, nothing obliges him to take land, and that the matter is a mere matter of freedom of contract or interference with contract. Either may be very desirable, very expedient, but neither can possibly be placed on the same level as the right to life and liberty, the maintenance of which is the final cause of all government—the one sole fact that distinguishes civilization from barbarism, the life of a man from the life of a beast. It is in the confounding of two things so infinitely different that the great error—we do not know why we should not speak plainly and call it the great crime—of the Government policy consists. This conclusion can only need to be clearly and distinctly put before the English people in order to convince them of that crime, unless moral sense and respect for law have taken leave of the nation at once and together.

M. ROCHEFORT AND M. GAMBETTA.

M. ROCHEFORT has learnt, perhaps too late, that it is never safe to stay away from a funeral. Probably he thought that, in neglecting to pay the last honours to M. Joly, he was running no risk to himself. What should the Apostle of the Irreconcilables do at a ceremony where he would necessarily be effaced before M. Gambetta? M. Joly was in favour with the Extreme Left, and to be in favour with the Extreme Left is the worst of all passports to the good will of the Communists. The nearer they seem to be to one another in the eyes of a careless world, the greater is the hostility that really divides them. To the Extreme Left the Communists are the fanatics who frighten people into disliking Radical measures. To the Communists the Extreme Left are the moderate Revolutionists who persuade people that they can get Radical measures without entirely upsetting the existing social order. If M. Rochefort had gone to M. Joly's funeral, he would either have had to remain silent, or to appear at a disadvantage by presenting himself in an arena in which his followers would have been few and M. Gambetta's many. These were excellent reasons for staying away if, unluckily for M. Rochefort, there had not been a still better reason for going. M. Joly had been his counsel at his trial, and as in 1871 to be M. Rochefort's counsel was but a doubtful road to popularity, it might seem that some gratitude was due for the service rendered. Very possibly M. Rochefort did not look at the matter in this light. A man of his temperament is not unlikely to think that, in accepting help, he really confers a favour, and, as it turned out, M. Joly lost nothing by his courage. Probably if M. Gambetta had not had a long-standing

debt to M. Rochefort, which he was only waiting his opportunity to discharge with interest, M. Rochefort's absence from M. Joly's funeral would have passed unnoticed. But M. Gambetta saw his occasion, and a happy inspiration, or an ingenious contributor, supplied the sleeping partner in the *République Française* with a phrase which hit M. Rochefort hard. The article which noticed his ingratitude towards M. Joly described it as *intransigeance du cœur*, and it would have been difficult to find words which were better suited to seize the French fancy. Men of M. Rochefort's peculiar gifts can hardly avoid making enemies, even among their reputed friends; and, when once his conduct in regard to M. Joly had been noticed and criticized, it was to be expected that the Communists, who secretly dislike him, would not readily allow M. Gambetta's contribution to the controversy to drop out of recollection. M. Rochefort saw the danger, and attempted to meet it after his accustomed manner. Unluckily for him, M. Gambetta knew more about his relations with M. Joly than M. Rochefort had cared to keep in mind. It did not suit the dignity of the *République Française* to go into all the particulars; but a less important journal stood ready to take up the running. The *Voltaire* has displayed a terrible familiarity with M. Rochefort's acts in 1871; and M. Rochefort's acts in 1871 show plainly that his principal anxiety was that the light of the Commune should not be quenched in his person. No doubt he had very good cause at that time to think that it might be quenched. The unlucky thing is that what seemed natural enough when M. Rochefort was quaking for his life, has quite another air when he is again at the head of a party and is a power to be reckoned with. His emotions in 1871 might have done him little discredit if they had been made public at the time. It is not given to every man to be dignified when he is confidently expecting to be shot. But it is exceedingly unpleasant to have all the palpitations he then underwent revealed to a public before which he has of late been playing the part of the indomitable popular tribune. The orator of the village tavern is sometimes disturbed by his wife's unexpected disclosure of some domestic trait which hardly seems to square with the majesty of his public pretensions, and this is precisely what has happened to M. Rochefort. He seems to have been a little too deferential to M. Joly; but his sins in this respect have been effaced by the more tremendous guilt of his prostration before M. Gambetta. The *Voltaire* followed up its attack by the publication of a letter which M. Rochefort wrote to M. Gambetta in July 1871.

It must be admitted that in this document M. Rochefort is presented as a very much milder person than he has of late wished to appear. In describing himself as a Communist, he has really been laying claim to honours which do not rightly belong to him. He assures M. Gambetta, not only that he took no part in the excesses of the Commune, but that from the first day to the last he never ceased to protest against them. Five or six prisoners owed their lives to his intervention, and the only reason why he did not save more was that his humanity had become too well known to allow of his intercession being listened to. Indeed, his own life was very far from being safe. The propriety of arresting him was continually under discussion among the members of the Commune, and his remonstrance against the "shocking decree" to which the hostages owed their death was very nearly fatal to him. As to the charge that he suggested the destruction of M. Thiers's house, it is the very opposite of the truth. All he did was to beseech the Communists not to destroy it. In point of fact, he was an unrecognized agent of the Versailles Government, doing his unnoticed best to see that things did not go from bad to worse. He tells all this to "Mon cher Gambetta" in order to show that he may intercede for him with a clear conscience. He has great influence with M. Thiers; will he not use it to get M. Rochefort's sentence watered down to perpetual banishment? He never wishes to trouble himself about politics again; a peaceful literary retreat in England or Italy is all that he cares for. There he will devote himself to the completion of a History of the Second Empire, which is already bespoken, and France shall hear no more of him.

Just before the publication of this letter M. Rochefort had gone to the office of the *Voltaire*, and had insisted on clearing himself of the charge of ingratitude towards M. Joly. In the course of his interview with the editor, M. Rochefort had taken a line which showed that he must have completely forgotten that he had ever committed such compromising revelations to paper. It was not true, he said, that he had made any efforts to get his sentence commuted. On the contrary, he had expressly forbidden his sisters to make any such efforts. If they did make them, it would be under the penalty of never seeing their brother again. As to M. Joly's part in his defence he had been amply paid for it in money, and overpaid for it in reputation. He did not manage the case at all well, and it was the foundation of his political fortune. Still, M. Rochefort bore him no malice, and would even have gone to his funeral had he not been afraid that it would injure the circulation of his paper. As to the omission from this paper of any word of regret for M. Joly's death, M. Rochefort accounts for it by his being kept away from the office for two days, during which his contributors, being all of them returned convicts, could not bring themselves to be civil to a man who had twice voted against the amnesty. If M. Rochefort had known of the document which was then in type somewhere in the *Voltaire* office, he might have spared himself this interview. All he had been accused of as regards M. Joly was an exaggerated love of life. The letter to M. Gambetta proved that, in order to gratify this passion, M. Rochefort was quite willing to throw his companions overboard. Now that he is once more in the same boat with them this is a which they are not likely to admire, and M. Rochefort is tionately anxious to clear himself of the reproach. He denies that the letter expressed his real mind, or that it was ever sent to M. Gambetta. It was simply the offspring of M. Joly's ill-regulated zeal for his client's safety. The advocate had come one day into the prisoner's cell, and had bidden him write a letter from his dictation. M. Rochefort obeyed, but as soon as it was furnished he pointed out to M. Joly that *le fou furieux* was the worst possible person to apply to when M. Thiers was in question. Indeed, it was only M. Joly's youth and inexperience that made such a suggestion possible. "All that Gambetta could do for me," said M. Rochefort, "would be to get me executed a fortnight earlier." M. Joly was convinced by this reasoning, but oddly enough did not destroy the letter. That remained in his bag, and was there, M. Rochefort says, a fortnight later. Even then, however, it was not destroyed; and from that time it has gone wandering about the property of no one until it is now published in the *Voltaire*. It must have taken all M. Rochefort's childlike innocence to have allowed a document which, if seen, would give so false a notion of his position towards the Commune to pass out of his possession. Even if he had carried out his intention of giving up politics, and playing the part of the peaceful historian in a foreign land, it would have been rash to leave a letter of this kind in his own handwriting entirely to the mercy of fortune. M. Rochefort would never have been quite without enemies, even if he had exchanged journalism for literature; and, in the hands of an enemy, such a letter would constitute an incalculable advantage. M. Gambetta, however, who ought to know something about it, says positively that the letter in question was sent to him in July 1871, and that he immediately used his influence with M. Thiers in M. Rochefort's favour. The *République Française* further mentions that when M. Rochefort made his escape in 1874, M. Gambetta raised 25,000 francs for his support and transmitted it to Sydney. These statements have been borne out by the discovery of another compromising letter from M. Rochefort—this time addressed to General Trochu—and the general impression in Paris is that M. Rochefort is hopelessly beaten. Whether this will prove to be correct it is difficult to say. The Communists can hardly trust him any longer; but, then, the peculiar influence which he exercises is not one into which trust largely enters. If the Commune were again trying its fortunes in open fight, younger men than M. Rochefort would come to the front. The Commune does not want his sword; but, as yet, it has not been able to dispense with his pen. His writing may not be all that it once was, and though M. Gambetta has supplied him with material for some happy observations, the general order of things under the Republic is less favourable to his peculiar skill than the general order of things under the Empire. But M. Rochefort's articles have become historical, and a certain portion of the Paris public would hardly feel happy without them. If this affair with M. Gambetta is likely to leave M. Rochefort without followers, it may not decrease his subscribers, and from some points of view a subscription is the best test of devotion.

THE VALUE OF SIGNBOARDS.

THE story of Dick Tinto, who defrays his hotel bills by painting [illegible] a new signboard for mine host, has been a commonplace [illegible]ture for a sufficient time. But we do not know that it [illegible]r occurred to anybody to supplement it by a legend to the e[illegible] that, Dick's works having gone up in the market, a fierce [illegible]tition for his signboards took place. The truth is that the m[illegible] characteristics of signboards are scarcely calculated to dis-p[illegible] the powers of St. Luke's followers, and that the works of art in question are ordinarily subjected to such severe atmospheric trials that whatever merit they possess is not, under ordinary circumstances, likely to last out the period necessary to turn an unknown painter into a hero of Christie's. The curious case of the Bettws-y-Coed signboard, however, which has now occupied two courts of law—a County Court and the Court of Bankruptcy—shows, among other things, that it is quite possible to entertain artistic angels unawares. It is true that the example in question was not obtained in barter for subsistence, nor was it in any way extorted from the necessities of the painter by the pressure of the *mauvais quart d'heure*. Still there are plenty of ways of obtaining sketches of which a wily landlord, and still more a landlady, could avail him or herself; and, considering the whole matter, it may be laid down that any Boniface of sense who inhabits a picturesque neighbourhood will do well to coax signboards out of his visitors as frequently as he can.

Law and art do not seem to have much to do with one another; yet they not unfrequently combine to supply interesting incidents, and still more interesting problems, to the observant mind. Putting aside the great and famous doctrine of copyright in ideas, there is the very intricate and pleasing question whether a painter, jealous of his reputation, is justified in impounding and destroying forged works attributed to him; the question whether Berlin woolwork is a sufficiently artful method of imitation to make its patterns an infringement of the rights of authorship; and several others, all of recent mooting. But this signboard case is perhaps the most dramatic of all, if not the most appetizing in its provision of legal

[illegible]. The board in question was not a Blue Lion or a Pig and Whistle, nor even the well-known "collection of fabulous animals," the latter of which indeed, offers some temptation to an artist who should treat it in the Byzantine manner. It was a Royal Oak, an obviously suggestive subject, and the painter was no less a person than David Cox. It was painted in 1847, and as the port-wine of that year was to other port wine, so apparently were its signboards to other signboards. Cox appears to have painted the thing merely out of friendship for the then tenant of the hotel. It is needless to say that in 1847 three thousand pounds had not yet been paid for any picture of his, and that he was still a member of what may be called the pre-silver-fork school. The landlord at the time of painting was a certain Edwin Roberts, and the signboard was undoubtedly painted for him. Nevertheless, he seems, or his heirs seem, to have attached no particular value to it, and it was left, though the tenancy of the hotel changed, to announce the building to which it was attached as one that provided good entertainment for man and beast. Twenty years of outside life in this climate would not as a rule conduce to the beauty of a painting; but it would appear that the sign was not one of the swinging variety, but was fastened against the wall by holdfasts, and may therefore be presumed to have been sheltered from the weather by the eaves of the house. At any rate, in 1866 certain artists who then lodged in the house, which was being altered, suggested that the thing was too precious to be left in this condition. It was accordingly brought in, framed, and screwed to the wall of the entrance hall of the hotel. How many tenants entered upon the enjoyment of it during the thirty and three years which have passed since its execution we cannot say, but certainly more than one; and no out-going tenant seems to have thought himself entitled, or considered it worth his while, to remove it. At last misfortune came upon the "Royal Oak," and its late tenant became bankrupt. The scent of creditors, liquidators, assignees, trustees, and such-like folk after valuable property is proverbial, and the bankrupt's representatives claimed the picture as a chattel divisible (let us hope not in the literal sense) among the creditors. The tenant may be presumed to be indifferent about the matter, but the tenant's landlord (the feminine is in this sense *verbum insuitatum*), Lady Willoughby d'Eresby, did not contemplate the abstraction of the chief ornament of her property with such calmness. The picture could not of course be claimed as a fixture, because the holdfasts with which it was originally attached to the outer wall, and the screws with which it was subsequently attached to the inner, fall under the head of those fastenings which, in its infinite wisdom and care for small things as well as great, English law decides to be usable without constituting fixtures. The only claim, therefore, that could be set up was that the picture was a sort of heirloom; that it was painted for the hotel; had been assumed and given up with the hotel by successive tenants; and was, in fact, part and parcel of the essence of the "Royal Oak." The County Court Judge decided in this sense; but Sir J. Bacon, the Chief Judge in Bankruptcy, has reversed the decision, and has decided that David Cox's signboard was "as much Roberts's property as the coat on his back." If he left an old coat in a cupboard in his room—we presume the Judge argued in this way—it would not have become Lady Willoughby d'Eresby's property; neither did the picture.

The mysteries of bankruptcy in all its arrangements and appurtenances are acknowledged to be things which even the legal mind cannot understand though it loves, and which the layman can neither love nor understand. The latter person in the present case would probably have felt inclined to decide in favour of Lady Willoughby d'Eresby. For, as the tenancy had changed without, as far as was shown, any claim being made by the outgoing tenant for the picture, or any sum being paid by the incoming one for the enjoyment thereof, it certainly would seem as if the signboard were generally understood to be an appurtenance of the hotel, and, as such, subject to be transferred *en bloc* with it to whomsoever, and from whomsoever, might be the occupier. Sir J. Bacon remarked with great truth that signs were going out. They are, and more's the pity. There are few persons who would not exchange the things of which the signless hotel is significant—the over-decorated coffee-room, and the German waiters, and the electric bells which won't ring, and all the rest of it—for the things which the signboard used to promise, and very frequently to perform. However, though signboards are going out, there are still plenty of them left. It would have been interesting to have had fuller information on the subject of them than appears to have been laid either before Sir J. Bacon or before the County Court Judge. What is the usual status of a "Red Lion"? Is he the exclusive property of the tenant or of the landlord? Might an unsuccessful or sated publican take his Lion away with him, unhooking it from its perch to comfort him on his retirement to private life? According to Sir J. Bacon he might. But, whatever be the abstract rights of the case, it would, we say, be interesting to know the usual practice. Besides, there seems to be a point of great subtlety, which was entirely overlooked. According to the witnesses, David Cox painted his "Royal Oak" on the existing signboard of the hotel. We ought, therefore, to be informed what the position of that signboard itself was, whether it was let to Roberts, or was his property, and whether, if he had been inclined to take the same views of his rights as Sir J. Bacon, he would have had to perform the perilous, though possible, process of removing the Coxian layer from the substratum that was not Coxian. However all these things may be, it is quite clear that Sir J. Bacon's decision is a godsend for tenants. All sorts of unconsidered trifles left kicking about in a house should be carefully treasured, inasmuch as it appears they do not become the absolute property of the landlord nor remain that of the outgoing tenant, but belong to the fortunate incomer. This is a doctrine of tenant-right which ought to put to silence and shame the importunate persons who complain that in England all things are done in the interest of the freeholder. And it may be admitted that the creditors of the late landlord of the "Royal Oak" are very lucky people.

The transformation of a thing so valueless that nobody seems to have cared to determine to whom it belonged into one so valuable that it is worth going through costly processes of law to decide its ownership is only a fresh illustration of an old peculiarity of the painter's lot. Mr. Ruskin has inveighed, after his manner, against those who give thousands of pounds for dead men's work and won't give hundreds or tens for the work of men living. Of course the answer is easy enough. The value of a thing, in money at least, is what it will fetch, and what it will fetch is determined by conditions which neither buyer nor seller can fix arbitrarily, or at his own pleasure. The problem what the "Royal Oak" was worth in 1847 is one which political economy is unable to solve. Nor does the rival science of æsthetics help us much. Æsthetically, the value of a picture, or anything else, is to be found in the pleasure it gives the owner. Who will construct a hedonometer for us which shall give the exact values in coin of the realm of a '47 signboard and a bottle of '47 port? Certainly none such has been hitherto constructed. In default of it, there seems nothing to be done but to take things as we find them, which is indeed the general conclusion of the philosopher. This, however, does not prevent the philosopher from wishing that some such stroke of good luck would fall to his lot as that which has befallen in this case nobody in particular, except, as has been said, the creditors of the late landlord of the "Royal Oak." Lady Willoughby d'Eresby is to be pitied; but it cannot be doubted that all sensible solicitors who draw up leases between landlords in one sense of the word and landlords in the other will insert henceforward a special covenant relating to signboards. As for the "Royal Oak," it may be suggested that it be called the "Late Royal Oak," or have its name changed altogether, in memory of the catastrophe. Of a signboard it is probably in no need, and therefore a successor to Cox need not apply. The whole thing, at any rate, will add a chapter to any future "Anecdotes of Painting" that may be compiled, as well as a useful clause to the "Cabinet Lawyer" and other manuals intended for the use of those members of the profession who have fools for their clients. Considering the usual habits and peculiarities of the British tourist, it would be by no means surprising if it also added, at least during next season, to the number of visitors at the "Royal Oak." To go and see the place where this remarkable signboard is no longer would be exactly the sort of thing in which such a tourist takes a pious and intelligent pleasure. In this way the incoming tenant, though no doubt disappointed, will be in a way consoled for the loss of David Cox's much-disputed work of art.

THE JUDENHETZE.

WE took occasion not long ago to comment on the present "anti-Semitic" agitation in Germany, which is no doubt mainly due to other, and less respectable, considerations than religious antipathy; though there is probably a certain admixture of *odium theologicum*, at least in South Germany, where the influence of Jews on the newspaper press is supposed to be exerted in an anti-Christian or anti-Catholic direction, and is in some quarters bitterly resented. Herr Stöcker indeed the other day, addressing a meeting of working-men at Berlin on the subject, called the press "a Satanic power." The *Judenhetze* however, under whatever variety of forms, is a phenomenon as old as Christianity, though it might seem at first sight hardly in harmony with the spirit of the Gospel. And it is fair to remember that in the darkest times of persecution Popes and Saints have stood forward to shelter the hated race from popular ferocity. Thus *e.g.* in the crusade of 1146, when a frightful massacre of Jews broke out in Cologne, Mentz, Spires, Worms, and Strasburg, St. Bernard threw the whole of his vast influence into the breach, though it required the full weight even of his sanctity and eloquence to stem the tide of popular passion. "God," he told the fanatics, "had punished the Jews by dispersion, and it was not for man to punish them by murder." When again, amid the horrors of the Black Death in Germany two centuries later, the plague was ascribed to the Jews and great numbers of them were put to death, Clement VI. made a noble effort to dispel the illusion. Several other Popes, before and since, have interfered in their favour, and his kindness to the Jews is a redeeming feature even in the career of Alexander VI. It has of late been the fashion with a certain class of religionists to rush into the very opposite extreme, and represent "the chosen people" as still the peculiar favourites of heaven; there was something of this sentiment, we fancy, mixed up with the working of the abortive Jerusalem bishopric scheme. And at this very moment the Jews are the subject of two opposite crazes, not equally innocuous, but almost equally irrational. While they are denounced and almost persecuted in Germany they are petted in England by a clique of harmless fanatics, who, with strange disregard to the most

obvious indications of character and physiognomy, are pleased to identify the English people with the lost Ten Tribes of Israel. It has even been elaborately argued that "the stone which was Jacob's pillar"—after a marvellous series of transmigrations, to which "the Flitting of the Holy House of Loretto" scarcely offers any adequate parallel—was conveyed first to Scone, and then by Edward I. to Westminster Abbey, and is the identical stone on which Queen Victoria was crowned, and moreover that Her Majesty is "a lineal descendant and inheritor of the throne of David." Moreover Lord Beaconsfield is shown, by an application of Messianic passages in Isaiah and elsewhere which we should hardly care to obtrude on our readers, to have held and to be destined to hold again a special place in prophecy as Prime Minister of England. But over these curious fancies we cannot linger now; those who care to learn any further particulars of the "Anglo-Israelite" controversy will find it ably discussed in a pamphlet by Mr. Wray Savile on *Anglo-Israelism and the Great Pyramid*. Our present object is rather to indicate the way in which the Jews have been habitually regarded from a very early period of Christian history. There is a familiar story of a sailor who was found unmercifully beating a Jew on a Good Friday, and who met the remonstrances of his astonished victim by observing that "the Jews had crucified his Saviour." "But that," replied the other, "was eighteen hundred years ago." "Possibly," said the Christian, without desisting from his cudgelling, "but I have only just heard of it." And Christians during many centuries seem to have acted on the assumption that the Jews of their own day were somehow personally responsible for the Crucifixion.

On the conversion of the Emperor Constantine, when the civil power, hitherto employed against the Church, was first turned against her enemies, the Jews were among the earliest victims of persecution. There had been a Judaizing heretical movement in the Church, and the Jews moreover were accused of stoning Christian converts from their own body. The penalty of death by fire was decreed against this crime, and apostacy of Christians to Judaism was to be punished by confiscation of goods. It must be borne in mind that under the Pagan Empire the Christians had been regarded as a Jewish sect, and had thus incurred all the odium which the Jews, not altogether without cause, had drawn on themselves at Rome, in addition to their unpopularity as Christians, while at the same time a much larger measure of toleration was in fact accorded to the Jews, by whom they were themselves hated with a bitter hatred as traitors and apostates. Justin Martyr complains that the Jews laboured with unwearied assiduity to stir up the passions of the Pagan multitude against them. All this helps to explain, though not to excuse, the bitterness of Christians against their old assailants when the tables were turned. In Spain, where the course of events which identified Catholic orthodoxy with national sentiment made the Inquisition exceptionally popular, there were also special historical reasons for the detestation of Judaism, and the burning of Jews became a cherished public spectacle. There is still extant a striking picture by Francesco Rizzi of a grand *auto da fé* of Jews and Jewesses at Madrid, as late as 1680, during the marriage festivities of Charles II., in presence of the whole Court and clergy of the capital. The Jews however were not simply the victims of an unreasoning prejudice. They were very early noted as slave dealers, and one of the first, and most justifiable, measures directed against them was the emancipation of their Christian slaves, which is enjoined by the Theodosian Code. In the ninth century however Agobard still complained of the number of Christian slaves bought up by the Jews. The dislike to them was aggravated by the fact of their being during the earlier part of the middle ages almost the only usurers—a profession which they embraced partly of course for the enormous profits they derived from it, but partly also because it was the only one open to them. When however in consequence of the Crusades, Latin Christians were brought into closer and friendly relations with Greeks and Mahometans, and the rise and growth of a commercial class followed, this new experience led them gradually to look with more toleration on their old enemies, the Jews. But the legislation against them was for centuries terribly severe, the great object being to cut them off from all intercourse with Christians. The Council of Elvira in Constantine's reign forbade all communication between the two classes; the Lateran Council ordered Jews to wear a distinctive dress; they were not to eat, or bathe, or enter into any partnership—still less of course to intermarry—with Christians; any Christian who took a Jewess for his mistress was by the legislation of the thirteenth century condemned to be burnt alive; Jewish criminals till the fourteenth century were hung between two dogs with their heads downwards. It was held that their property might at any time be lawfully confiscated, as being gained by usury, and the permission, first tacitly and then expressly accorded to them, to practise usury was only justified on the ground that their salvation was already hopeless. Their final expulsion from Spain was due to the influence of Torquemada. They offered 30,000 ducats for permission to remain, but he overcame Queen Isabella's hesitation by reminding her that "Judas sold his God for thirty pieces of silver, and she was about to sell Him for thirty thousand." But the national detestation for them which had again and again found expression in wholesale massacres, in various Spanish cities made it practically impossible for them to remain. Numbers, who had been converted against their will, relapsed into Judaism and were burnt alive. The number of exiles is variously estimated, by Mariana at 800,000, by Cardoso at only 120,000; prob[ably those] who place it at about 400,000 are nearer the mark. A [consider]able number escaped banishment by a feigned conversion.

A yet harder trial awaited the hated race. The exiles had been promised a refuge in Portugal, and some 80,000 accordingly settled there, but the King was persuaded to break his word, and all the adults were expelled, while children under fourteen were seized to be brought up as Christians. It was only indeed through the intervention of Rome that any were eventually allowed to escape, for by a disgraceful fraud those who had been ordered to quit the country were detained and reduced to slavery. We have spoken already of the industrial activity of the Jews, which made them almost indispensable to the Christian community, and secured them a fair share of toleration in the Italian Republics, where they were suffered to practise usury and medicine unmolested. But they were not only the ablest physicians and financiers of the day; they also took the lead in literature and natural science. That a large portion of their literature was controversial and directed against Christianity did not of course make them more acceptable to their Christian fellow citizens; but the position of influence they contrived to maintain throughout against such fearful odds was due as well to the literary as to the commercial capacity which distinguished them above their Christian contemporaries. Spain to this day has never recovered the effects of their expulsion. The widespread animosity felt against them in Germany at this moment is quite as much a proof of their unabated energy as of their still being apt to use their successes not wisely but too well. Nor can we forget that it is only within very recent memory, and against strenuous opposition from many different quarters, that they have attained political emancipation in England, and that there are probably still very many Englishmen who think—even if they hesitate openly to assert—that their emancipation was a mistake. We are certainly not going to endorse the startling and somewhat unintelligible theories of the future of Judaism broached in *Tancred* or in the closing chapters of George Eliot's *Theophrastus*. But it can hardly be denied that the distinct and persistent vitality of the Jewish people, maintained through some fifteen centuries of unexampled obloquy and oppression, is a phenomenon at least as singular as the antipathy which in some shape or other they appear always to have attracted to themselves from the days of Suetonius and Juvenal to our own.

LONG-RANGE INFANTRY FIRE.

A CONTROVERSY of very great importance has proceeded now for some time, both at home and abroad, between advocates of what is known as "long-range infantry fire" and others who would restrict the employment of the rifle to ranges where ordinary eyesight is better able to distinguish the mark, and the weapon itself more likely to attain it. The former would utilize the long reach of the arm to the utmost; the latter would rather reserve fire—or, at any rate, intensity of fire—till the moment when the power of the arm can be expended with, as they allege, greater immediate, as also greater ultimate, results. The question is not altogether so simple as may at first sight appear. Some may perhaps be ready to exclaim, "By all means fire away as soon as the enemy is within reach, and continue shooting at him; the more shots you fire the greater the chance of hitting; the longer he is under fire the more loss he will suffer." The question is, however, complicated by certain considerations, physical and moral, which demand examination. We are not concerned here to advocate either view, but rather desire to ascertain, after a balancing of arguments, if it may not be possible to reconcile opposing convictions on intermediate ground. We had occasion to remark incidentally in a recent article that British infantry having from mediæval times, as history attests, known better perhaps than any other how to use their weapons on a field of battle, whether those weapons have been long-bow or cross-bow, sword or lance, musket or rifle, there is *à priori* reason for believing that no mechanical improvement in arms can be otherwise than advantageous to them. It must certainly be allowed that a stage has been reached when it is incumbent on us to examine carefully what new opportunities perfected arms afford us, and what obligations they impose upon us. There is only one reservation to be made, which is that we are not logically bound to come to the same conclusions that other nations do; tactics which may suit others are not therefore necessarily the best for ourselves.

Advocates of long-range infantry fire have found an able exponent and champion of their theory in Captain W. H. James, R.E., in an article which appeared in the May number of the *Journal of the United Service Institution*. It is there laid down that the two important lessons taught by late wars, and "which have been deeply taken to heart by all European military leaders," are:—1. "The value of long-range infantry fire, by which alone the true advantages of the modern rifle are gained." 2. "The necessity for increased power and accuracy in our guns, and the need of a powerful shrapnel." We are then told that in the next war there will be seen the systematic use of wide-sweeping infantry fire, and that the modern battlefield will be more or less under bullet fire from rifles and shrapnel shell up to a range of 3,000 yards. In other words, men will begin to ply their fire at the very furthest point where a bullet will kill, maim, or frighten. Our readers are aware that all

military rifles are provided with graduating sights up to a certain definite distance, which differs with particular arms. Thus the Austrian *Werndl* is sighted up to 1,100 yards, the Prussian *Mauser* to 1 mile, the French *Gras* to 1½ mile. Beyond those ranges the soldier, in default of a flying-sight attached to the fixed one, must trust to his eye and judgment—guides, all will allow, very liable to err, and peculiarly so in the heat of battle. At the very long distances, to enable the bullet to travel so far, the rifle must be pointed high up into the sky, and the missile describes in its course a vast curve. The greater the curve the nearer to the vertical is the fall of the bullet, and therefore the smaller the area of its potential destructiveness. The flatter a trajectory—that is, the less the arc described by a bullet, and the straighter its course—the greater the danger for all in the direction of its flight. At the longer ranges, then, the zone of danger is limited to a length of a few feet, and it is within this zone the soldier must make his bullet take effect. But the eye and judgment of the shooter cannot unfortunately do much in assisting the missile. Even at 1,000 yards a company begins to look, for all who have not keen sight, much like a kind of low hedge or bank, though at that distance ordinary marksmen would account for it in a very short time; but even at less than a mile a battalion in quarter column looks no more than a company at the former range; and even then, we are not arrived at what some of the advocates of long-range fire mean by the term. At 1,800 yards a company appears as a dot, and at 2,200 yards a battalion in quarter column not much larger, though a great deal depends on the kind of light and the nature of the country. But, even if the eye, by clearly discerning the mark, could give that assistance which it certainly does not, what of the judgment which is to estimate the correct distance? Even at the comparatively small range of 800 yards, an error of only some 25 yards too much or too little will cause the marksman to miss an infantry soldier standing up. Those who have been present with companies when judging distance know how poor is the general result after 500 or 600 yards, if the instructor is adroit in placing the object in different lights and continually shifting its position. At present our men have not one-quarter the practice they ought to be given in this extremely important exercise. So little confidence have they in their own capacity for judging accurately, that they are always found looking for some landmarks, whose distance has been ascertained, to serve as a guide. If a small error entails a miss at 800 yards, how much more when that range is doubled and trebled! And, if it is not easy to judge closely on known ground and oft-trodden ranges, it will be vastly more difficult to do so in broken country, on a new theatre, across dips in ground, over long slopes, when the object is ever so far away and perhaps constantly in motion. But, allowing that, by frequent practice, the aid of acoustic telemeters, and scientific range-finders, a fair estimate is obtainable even at the further distances, there still remains the adjusting of an imaginary sight; and those who may have seen the curious practice the French made at Châlons some years ago when using a broad thumb for backsight at ranges over 500 yards, will not put too much faith in what can be done in battle at four times five hundred yards with no sight at all, even with the best existing rifle.

Before going further we will briefly refer to the chief instances where long-range infantry fire unquestionably did great execution. When the Prussian Guard commenced their movement at the battle of Gravelotte against St. Privat, they were distant from this village about 2,500 yards. The advance being plainly made out by the French infantry in possession, the latter began to fire, and so murderous was the execution that the enemy were brought to a halt when scarcely within replying distance of their own arm. The severest loss was experienced in the interval between 1,700 and 700 yards. In the Russian attack upon the Turks at Gorni-Dubniak their advancing columns began to feel the effects of infantry fire when still a mile and a half away. When they got a quarter of a mile nearer, bullets swept the columns like a hailstorm, more or less partial, and between three-quarters of a mile and half the fire became inconceivably violent, causing enormous losses. In every action the Turks began to fire away as fast as they could the moment the enemy came within the extreme reach of their weapon, and the Russian columns lost severely in consequence. The French in their war were somewhat more sparing of ammunition; nevertheless the tactics they pursued with such success at St. Privat were repeated in subsequent actions, and it was remarked by the Prussians that they suffered sensibly more at the longer than at the shorter ranges. At first sight it would seem, then, that the best course for infantry to pursue in the future is to imitate these tactics, to open fire at the furthest possible reach, and to continue the fire regardless of expenditure in ammunition. That arm must be procured which, having due regard to lowness of trajectory, can carry furthest, be discharged and reloaded quickest; and it will be the first care of a general to provide for instant and constant use an unlimited supply of cartridges. The Turks carried on their persons, or had at hand, cartridges enough to allow of each man firing all through a battle as much as he pleased. The Russian soldier has on or by him 120 cartridges, which is more than any other European soldier has; but it is plain that, if battles are to be fought on the above conditions, 120 cartridges per man are insufficient for the necessities of the case.

Now let us make an observation on the circumstances of the engagements referred to. At St. Privat the Prussians advanced in two brigades, offering each a magnificent mark; their inferior weapon did not admit of return fire. The attack of the French Cuirassiers at Wörth has often been spoken of as "magnificent, but not war"; the Prussian attack of St. Privat was not one whit less contrary to every sane principle of modern war. It is, indeed, necessary that we British should be careful how we imitate others without due consideration. Here we see the most scientific generals in Europe, leading the most instructed troops, conducting an action in such a way that we should assuredly have tried, and deservedly tried, one of our own chiefs by court-martial had he gone to work in the same way, and led the Brigade of Guards to certain destruction. No wonder the French saw their opportunity; no wonder they launched bullets to their extreme reach! To our mind, the results of the action at St. Privat convey no new lesson, and the same may be said of that at Gorni-Dubniak, where the Turks, descrying huge columns of the enemy advancing as if to parade, naturally set to work as hard as they could to destroy them. In this case also the attacking troops had an inferior weapon, with which reply was impossible till they drew near.

The fact is, at present there is little but theory to go upon. And what we want theory to tell us is not what effects were wrought under conditions which will not be repeated, but what will be the probable results when battles are fought on new principles. No war has yet been seen where the combatants were equally well armed. There has been no fight where both combatants could give the rein to long-range fire. It has yet to be seen how, under the hitherto unexperienced pressure of powerful guns using most formidable shrapnel up to 4,000 yards, attacking tactics will undergo modification. We shall see, if one, then both sides playing at long-range with rifles, and shrapnel taking effect beyond any possible rifle reach. Is it probable that battles will ever be decided even by shrapnel at long ranges? If not, how should the result be brought about by the missile which at those distances is, as it were, held within the grasp of the other? We agree with Colonel C. B. Brackenbury when he says, "By the French chassepôt men were killed at 1,600, 1,800, and 2,000 yards; but no battle has been, or ever can be, decided by such shooting as this." It is quite another question, however, when we come to consider the *utility* of employing long-range fire by infantry.

And here it may be well to set out the principal objections urged against it. We borrow their form from a paper by Captain James on the subject of musketry, published in 1878. Objection 1. Long-range fire is not so effective as is supposed, the proportion of hits to misses being very great; and it follows, therefore, that it is better to reserve fire for ranges where the proportion is more favourable. 2. It would be impossible to keep up the necessary supply of ammunition, and, consequently, there would very likely be a dearth of cartridges at the decisive moment of the struggle. 3. The employment of long-range fire would be the death of the spirit of the offensive. 4. The large columns and other widely spread-out objects against which this species of fire is thought to be so very effective, are less and less seen on the battle-field.

Space will only allow of our observing generally upon the above arguments. The chief point in the question turns upon the deduction from Objection 1—That, on account of the alleged disproportion between shots and hits at long ranges, it is better to reserve fire. A point might be reached at which it would be absurd to employ rifle-fire. We presume that not even the most extreme advocates would have British infantry blazing away in Turkish fashion. The French *Gras* may be made, by giving the rifle its highest elevation, to send a bullet a little over 2½ miles; but their Regulations lay down that, in preparing an attack, skirmishers may begin to reply to an enemy's fire at about 900 yards; the French do not appear very sanguine as to results obtainable much further off. "It is possible," they say, "*under certain circumstances*, to obtain a *useful* effect up to the furthest limits of the sight—*i.e.* 1½ mile, or even to the extreme range of the rifle, about 2½ miles." Again, "large masses of troops or a battery may be fired at *up to 1,100 yards*." In Austria it is laid down that the "*decisive stage* of an infantry fight lies within a distance of 500 yards from the enemy, within which range an effective fire can be obtained. Nevertheless, circumstances will often permit considerable results to be obtained up to ranges of 1,200 yards." But "fire at long range is nevertheless to be regarded as *exceptional*, and to be employed only against extensive objects." In Prussia it is laid down that "to get a good effect against objects more than 770 yards distant requires a large expenditure of ammunition, and if it is to be quickly attained, a proportionately large number of men must be employed. *Under certain circumstances*, however, a good effect against large objects such as batteries and closed bodies of troops may be obtained *up to 1,320 yards*." In neither of the above quotations do we find a sanguine estimate expressed of great results ordinarily attainable at very far ranges. Rather, in all the Regulations it is sought to impress upon men the necessity of accurate shooting at moderate distances, where alone the ultimate issue can be decided.

But Captain James says:—"The bloody fields around St. Privat and Plevna have taught the lesson that it is the mass-fire of troops, and not that of individuals, that is to be dreaded. Once this is admitted, it follows that *the oftener men fire the more deadly will the result be*, and hence long-range infantry fire, which is the natural expression of the fact that, although at long ranges one man may not hit the man he fires at, still he may hit another, and that, when a certain number of men fire at a given object, some are perfectly sure to

hit the mark." We confess to being unable to make these deductions from the premisses. That mass-firing, controlled volley-firing by companies, battalions, or brigades, would be attended on occasion with excellent effects, even at extreme ranges, is not to be denied; and in some of the Regulations it is expressly stated that good results can only be expected at much more moderate ranges when volley-firing by numbers *is* employed; but we quite fail to see why "the oftener men fire the more deadly will be the result." It does not follow at all. If it did, we are wrong in not getting the Soper rifle at once, "from which 43 well-aimed shots have been fired in a minute." But all experience goes to prove that better results, unless exceptionally as at St. Privat, follow upon moderate expenditure of ammunition, well directed, than upon excessive intensity of fire at extreme ranges. In a certain degree it may be true that, "though a man may not hit the man he fires at, still he may hit another," and that when many shoot at a given object some will hit it. But no man, unless gifted with eagle sight, can aim at another at the ranges we are supposing, simply because he cannot see him. It is ludicrous to talk of aiming at a person a mile off. Even with fair glasses, a line of skirmishers in a field looks like scattered crows. And a man aiming at a company column aims at what to his appreciation is one single dot, which is entirely missed if there be but a hair's breadth of latitudinal error in aim, not to speak of the immense margin open to vertical error. The chances are, of course, that, if five hundred men aim a volley at a mark, some will hit it at whatever distance; but the number of hits must largely depend on exact knowledge of the range. In some armies volleys at the same object are delivered with different sights, so that if one lot of shots falls short and another passes beyond, the centrally-sighted aim may tell. No doubt by this method a deep space of ground is covered, and we are far from denying that occasional circumstances of battle may not only justify but demand mass-fire, with all the waste of ammunition it must entail. This is, however, scarcely the point in question; rather we are concerned to ascertain which is the truer position, that "the oftener men fire the more deadly the result will be," or that it is better to reserve fire for decisive distances. Again we may inquire if it is not possible to hit a happy medium? That the steadiness, the *morale*, of troops—of all troops—is shaken by shooting wildly at uncertain and excessive ranges has been repeatedly proved. The explanation is mainly this—that they get to believe that the issue is being decided far away, that a decisive moment has arrived before it really does arrive; so that when the real encounter comes off, and the enemy is perceived to be only beginning, there is a feeling that, having failed to beat him with their best, they are not likely to fare better with what is left. When the Prussians, profiting by the earlier lessons, became more wary in their method of approach and were able to get near the enemy, they found their losses diminish just where they should have proportionately increased. The French by that time had got completely out of hand; it seemed as though they were beginning a new battle against fresh foes; they had become thoroughly unsteadied and fiercely excited by constant rapid shooting; like the Turks, when they did not fire from the hip without putting the piece to the shoulder, they literally pitched up the musket to some angle more or less than 45° and let fly; in the smoke, confusion, noise, excitement, uncertainty, it was all the same to which angle, so long as shot after shot could be sent somewhere in the direction of the plains, forests, mountains, whence Prussians were coming, or were supposed to be coming. Of course there were many good, self-collected marksmen among the French soldiers who knew better than to follow the wild lead of their comrades; but we are speaking of the conduct of the troops generally, and especially at a later period of the struggle when the armies were little more than an aggregation of half-trained conscripts. In war it is necessary to consider not only the effect produced on the enemy by any action or disposition of ours, but also the effect on our own troops; and in this instance we have seen an army unsteadied, almost demoralized, by abuse of its own initiative, before even the enemy, with their rifles at least, had seriously engaged. Extravagant firing was not a peculiar feature of the late wars; a hundred years ago the French firing tactics were notorious; ours had as much reputation in an opposite direction, and history has preserved striking instances of the results when these tactics were opposed to each other. These results were identical in 1870 and in the old wars; wild shooting found no compensation in increased expenditure of powder; it only induced unsteadiness and unwholesome excitement. That we can now shoot eight times as far as in former wars, and twenty times as rapidly, does not materially affect the principle.

As regards Objection 2—That "it would be impossible to keep up a necessary supply of ammunition"—the obvious reply is that, as the Turks managed it, so can we; if the expenditure is necessary, the supply must be forthcoming—*coûte que coûte*. Then "the employment of long-range fire would be the death of the spirit of the offensive." There is apparent force in this objection. Many troops are capable of gallant efforts, concentrated in a brief struggle, who would not fancy a prolonged advance under intense fire. It would be more agreeable to many men to lie behind a stone and fire away at enemies a mile off, than to have to get over that mile while being constantly potted at. But, if neither side took the offensive, wars would come to an end. The Prussians and Russians in their several wars, having generally taken the offensive, were compelled to come in close, or their weapons could not have replied to any purpose. The Turks and French, however, were neither of them loth to attack, although in doing so they threw away the superiority of their arm by voluntarily entering the range of an inferior arm. When all is said, it is the province of guns to open a path for the small-arms. They have greater range, and, what is more important, their shells have a lower trajectory than rifle bullets. Woe betide that army in the next war whose artillery is below the modern mark! Some may have doubts as to the practicability of guns advancing very near their object, even if, as has been suggested, the gunners are protected by iron shields. There can be no manner of hesitation in affirming that the future in long-range fire belongs to powerful guns with their capacity for lodging a terrible shrapnel shell beyond extreme rifle reach—we allow for possible improvements in small-arms—to perfected mitrailleuses, able to send their 600 shots a minute to at least 3,000 yards, and to revolver-cannon. Considering the matter but from one side—a very important one when treating of ranges where unassisted sight fails to distinguish all but mountainous marks—guns can be laid for those ranges, while the elevation to be given to the rifle must at present be guessed at; gunners may be directly assisted, riflemen only indirectly, by "aids to vision," unless we put the latter into spectacles, or affix a telescope to their pieces. It will probably be thought that, having reference to the development of power in the guns which is promised in the near future, Objection 3 cannot be discussed without bringing in the question of artillery. Speaking broadly, if our guns open a path for the rifles, well; no infantry not destitute of "the spirit of the offensive" would hesitate to advance when their opportunity had been cut out for them. If the enemy's guns palpably overbear our own, the introduction of infantry on the scene gives an addition of one factor more on either side, of presumably equal strength, "and the remainders are unequal."

Objection 4—"That troops will not move henceforth in such formations as to allow of long-range infantry fire taking due effect"—has been incidentally touched upon. It is not probable after late experiences that battalions and squadrons will stand grouped like blades of grass in a field waiting for the rain. When an object is tangible, be it half a troop, half a company, half a battery, one gun with its gunners, such object is worthy all the attention—the measured attention—which men with rifles in their hands can give to it. This is something very different from what those intend who would "rain projectiles" upon every inch of ground where an enemy might or might not plant a foot. If any potential foe is likely to play this sort of game, we should advise the insertion of a new paragraph in our Musketry Regulations, which is suggested by what people do when they go abroad having left behind their umbrellas and waterproofs, and are overtaken by a hail-storm or heavy shower—they take shelter till the storm has blown over.

We have perhaps sufficiently indicated in the foregoing remarks the lines upon which, in our view, a compromise is possible between opposing schools. We cannot agree with Captain James when he says that by long-range infantry fire alone the true advantages of the modern rifle are gained. Neither does it follow that, because long-range fire is often attended with expenditure of ammunition disproportionate to the results obtained, that *therefore* it is better to reserve all firing, or heavy firing, for ranges where the proportion is more favourable. The question is, in one sense, one of degree and opportunity; in another, one of fire-discipline, trained skill, and constant practice in judging distance. By all means let the soldier be taught to utilize the far reach of his arm, but not with a view to training him to believe that the tug of war will be decided by even the very best shooting he can make at extreme distances. When the soldier realizes, as he only will after a course of much more practical training than he now gets, how much better results he obtains from his weapon used with discrimination and coolness and disciplined steadiness and self-restraint, than when it is merely made a vehicle for emptying his pouch with the utmost despatch, he will be prone to think twice before he throws away a shot, more especially at ranges which his eye can barely fathom. When we reach this desirable state of things we shall have advanced further than can be said to be the case at present towards determining accurately the distances where, the occasions when, and the degree in which, infantry fire-power may be turned to the best account.

THE WESTMINSTER PLAY.

A FEW years ago, probably, the annual performance of a Latin comedy by the Westminster scholars was generally regarded as nothing more than a curious and interesting survival of an old institution which had elsewhere fallen into disuse. The educational advantages of the custom, though no doubt they were present to the minds of the authorities and had much to do with the maintenance of the tradition, were little thought of by people at large, and the play was generally regarded as occupying a position similar to that held by the cricket match between the School Eleven and the two Houses of Parliament—as a custom, that is, which existed in Westminster School and nowhere else, and was worthy on that account of being kept up. Of late however, there has been a revival of interest in Latin and Greek plays regarded as plays, and not merely as literary compositions, and there is a growing disposition among the teachers of youth to treat Latin and Greek generally as languages which once were

living, rather than as being now certainly dead. A notable sign of this revival was the performance last spring of the *Agamemnon* of Æschylus, which took place in Balliol College, and is now being repeated at St. George's Hall. Such performances as this may be given again, but there are too many difficulties in the way for them to become frequent, and it is perhaps impossible for any adequate representation of a Greek play to be given by schoolboys. Latin comedies, however, from their simpler construction and more limited range of thought, and, above all, from the absence of a Chorus, are far less exacting in the demand which they make upon their interpreters; and their occasional performance would do much to give boys a lively interest in their classical studies, though any newly established custom would necessarily lack the charm of association and tradition which gives peculiar interest to the Westminster Play.

The choice of the works of Terence for these performances in preference to those of Plautus has often been criticized, but, as we think, very unjustly. No doubt Terence is inferior in dramatic power to his older rival, and this inferiority is suggested or expressed by such critics as Cicero and Cæsar in the lines quoted by Suetonius in his life of the poet. Cicero speaks of him as follows:—

> Tu quoque, qui solus lecto sermone, Terenti,
> Conversum expressumque Latina voce Menandrum
> In medium nobis sedatis vocibus ecfers
> Quicquid come loquens atque omnia dulcia dicens.

Cæsar's verses bring out more clearly the relation of Terence to his competitors:—

> Tu quoque, tu in summis, o dimidiate Menander,
> Poneris et merito, puri sermonis amator.
> Lenibus atque utinam scriptis adjuncta foret vis,
> Comica ut æquato virtus polleret honore
> Cum Græcis, neque in hac despectus parte jaceres.

In fact, Gifford's lines, used by the authors of *Rejected Addresses* as the motto for Laura Matilda's *Dirge*, exactly express the estimate formed of Terence by Roman critics of a later generation:—

> You praise our sires; but, though they wrote with force,
> Their rhymes were vicious and their diction coarse:
> We want their strength, agreed; but we atone
> For that, and more, by sweetness all our own.

The poet who is praised as "puri sermonis amator" and "omnia dulcia dicens" is perhaps a more suitable study for the young than Plautus, whose Latinity is not nearly so perfect, and who, moreover, with all his vigorous humour, certainly did not write *virginibus puerisque*. Terence himself is not altogether free from this reproach, but in the *Andria*, as it is acted at Westminster, there is nothing which can offend the most sensitive. The leading characters are the familiar figures which appear every year in Christmas pantomimes as harlequin, columbine, clown, and pantaloon—the two lovers, the comic servant, and the "comicus stultus senex," as Cicero rather unkindly describes the deluded father of Latin comedy. The heroine in this instance does not, indeed, appear on the stage at all; but her fate and fortunes are, with rare art, made a subject of the liveliest interest to the spectators. The tenderness of feeling which Pamphilus shows towards his outcast wife and her infant son forms one of the great charms of the play for modern readers. We may doubt, however, whether it did much to enlist the sympathies of a Roman audience, who would be far more delighted with the plots of Davus, and the way in which Simo is finally outwitted, than with questions of conjugal affection. We can scarcely doubt that the broadly farcical portions of the play were displeasing to Terence himself, and that he only introduced them because stage tradition and the taste of his audience demanded something of the kind. The dragging off of Davus to the treadmill in the last act is so clumsily contrived, and so unworthy of the delicate humour of the rest of the play, that we may well imagine the poet to have inserted it in contemptuous acquiescence in the tastes of his hearers. In no way, perhaps, can we more fully appreciate the superior comic power of Plautus than by comparing this episode with the punishment of Gripus in the *Rudens*. There the avaricious knave is foiled again and again in the use of his familiar weapons, and is appropriately punished by the ridicule of honest men and a keen sense of his own utter discomfiture, without the employment of any such pantomimic devices as the one to which we have referred. Another, and perhaps a still more serious, defect in the play is the falling off of interest in the last act. When Chremes has, in the fourth act, discovered the child of Glycerium exposed before Simo's door, and has overheard the conversation which Davus forces upon Mysis for the purpose of revealing the truth, it is quite clear that the marriage between Pamphilus and Philumena will be broken off. The arrival immediately afterwards of the Stranger from Andros, and his inquiries about Chrysis and Glycerium, make it equally certain that he comes to clear up the mystery of Glycerium's birth and parentage. The fifth act, therefore, is tedious and unnecessary, and is only enlivened by the violent recriminations of Simo and Crito, and by the fragment of pantomime to which we have already referred. But the exquisitely written dialogue would atone for defects of construction far more serious than these. Many lines and phrases in the play are among the best known of the commonplaces of classical quotation, and those of the spectators who were nurtured upon the old Eton Latin Grammar always recognize and applaud such lines as "Omnes omnia bona dicere et laudare fortunas meas, qui natum haberem tali ingenio præditum"; and the still more familiar "Amantium iræ amoris integratio est."

The acting of the play is good throughout. We are inclined, though not without some hesitation, to place the Davus of Mr. Bain first in order of merit. The suppressed impudence which underlies his deferential bearing towards Simo was always happily suggested, and never made too prominent, and his whole manner when in the presence of his master was well contrasted with his frank familiarity with his master's son, and his contemptuous insolence to the melancholy Charinus. His relation of the "fabula," as he supposes it, by which Glycerium is made out to be a freeborn Athenian, was excellent; and his acting in the dialogue with Mysis, which he intends Chremes to overhear, could scarcely have been better. Here he was well supported by Mr. Waterfield, as Mysis, who throughout played a rather awkward part very well. The part of Pamphilus is of course by far the most difficult in the whole play, and Mr. Brandon deserves the greatest credit for his rendering of a character which would severely tax the powers of the most accomplished actor. It would be ridiculous to expect a perfect performance of such a part as this from a young amateur, and it speaks well for Mr. Brandon's acting that he achieved his greatest success in the touching passage at the end of the second act, where Pamphilus relates to Mysis how Chrysis on his death-bed had committed Glycerium to his care. Throughout the speech he showed the utmost feeling, and made a strong impression upon his audience, and the concluding words, "Accepi; acceptam servabo," were greeted with loud and well-deserved applause. The part of Simo, important as it is, gives the actor far fewer opportunities than those of Davus and Pamphilus. Mr. James's rendering left little to be desired. In the matter of elocution he was perhaps the best of all the performers. He recited the rather lengthy speeches in the first act very well indeed, and altogether invested the character with a good deal of quiet dignity. The stage management was very good, and there were no hitches in the performance. One word of criticism may perhaps be allowed to us. In the absence of the "modi" which "Flaccus, Claudii filius, fecit tibiis paribus" for the first representation of the comedy in the ædileship of Marcus Fulvius and Manius Glabrio, surely music more appropriate than very modern waltzes and selections from opéra bouffe might be played between the acts. Some simple airs from the old Italian masters, to whom Handel himself is often indebted, would be far more in keeping with classical comedy than such stuff as may be heard outside the sacred precincts of Dean's Yard played on any piano-organ.

The chief feature of the Prologue was a warm and hearty recognition of the long services of the second master, who is now retiring after, we believe, more than twenty years of valuable work done for the school. The vigorous applause from all parts of the house with which the allusions to him were received shows how fully his worth is appreciated both by his present pupils and by old Westminsters. The Epilogue consisted of an amusing parody of the proceedings of a Bribery Commission. The three Commissioners summoned as witnesses various of the characters in the play. Pamphilus, made up in close imitation of Mr. Bancroft in *Money*, represented the guileless candidate, who knew nothing except that he had specially forbidden anything approaching to corrupt practices. He was followed by Davus, whose astonishing light suit, bright green tie, and black wig and whiskers suggested one of Mr. Toole's favourite characters. This figure was, of course, the energetic and not very scrupulous agent. Mysis appeared gorgeous in a new dress, the reward of the judicious influence which she had exercised over her husband. She explained the method of persuasion adopted by Davus, which resembled that recommended by Mr. Perker on the occasion of the Eatanswill election, and her evidence drew from the Commissioners an expression of surprise that a woman should meddle with those things "propria quæ maribus." Perhaps the loudest expression of merriment was called forth by Crito, who appeared as a shabbily dressed old man, and, when pressed on the subject of the person who had bribed him, pointed with a disreputable umbrella to the sky, and asserted that the mysterious stranger came "de luna." All these witnesses duly received their certificates, but Byrrhia, as a half-drunken rough, was less fortunate. In spite of his magnanimous assertion, "vilius argentum est auro, virtutibus aurum," his "teetotalian" vows, and his statement that he could not write, he was proved to have received bribes and refreshment, and to have demanded "sacchara" from the agent in a letter which was produced in court. In the inquiry as to his Bacchanalian propensities, the temptation to introduce the now venerable joke from *H.M.S. Pinafore*, was too strong for the composer of the Epilogue, and the question "Quid, nunquam?" with its appropriate answer "vix umquam!" provoked no less laughter than if the idea were as new as the language in which it was expressed. Finally Byrrhia is condemned to six months' hard labour in the "pistrinum," and, when he expostulates, is addressed as "contemptor juris," and dragged out by a policeman with his sentence doubled. A few lines from the President, reminding the audience of the school elections where a purer morality reigns, bring an excellent performance to a close.

MR. SHERMAN'S NEW REFUNDING SCHEME.

THE Report of the United States Secretary of the Treasury, transmitted to Congress as usual at the beginning of the Session by President Hayes, sketches out a very remarkable plan for dealing with that part of the Federal Debt which falls due in the coming year. But before we enter upon the consideration of this plan, it may be worth while to recall to mind what has already been done with the United States Debt since the close of the Civil War. At the beginning of the financial year 1866-7, when all the accounts had been got in and the whole expenditure of the war made up, the principal of the debt amounted in round numbers to 555 millions sterling. European observers in general were of opinion that the wisest course for the restored Union then to pursue was to reduce expenditure as far as practicable, and to repeal all taxes not required to cover indispensable outlay. In the heat of the struggle there had been no time to select taxes, and as the proportions of the conflict grew larger it had become necessary to put on impost after impost with little regard to the effect upon trade. Moreover, the contest had been fought out to the bitter end. The South was literally exhausted, its social system revolutionized and its industry disorganized; while the North and West, though triumphant, had had to strain their resources most severely. Nevertheless, the American people decided otherwise. They would bear their burden of taxation until they had wiped off the debt, and would teach Europe the lesson that the generation which mortgages the resources of a country is bound to redeem them. How they have fulfilled this resolution is shown by the usual monthly statement issued at the beginning of December. According to this statement, the principal of the debt, not setting off the cash in the Treasury, amounted on December 1 to 419 millions sterling; setting off the cash in the Treasury, to 381 millions sterling. Between July 1, 1866, and December 1, 1880—a period of fourteen years and five months—the debt was reduced 136 millions sterling, if we take no account of the cash in the Treasury; if we do take the cash into account, the reduction was as much as 174 millions sterling. In the first case, the redemption of debt has averaged a little over nine millions a year; in the second, it has been at the rate of twelve millions annually. But this is not all. In 1870 the refunding of the debt in bonds bearing a lower rate of interest was taken in hand; and, though the success at first was very slow, the operation has been carried through. Partly owing to this reduction of interest, and partly to the redemption of the principal, the interest on the debt has been cut down from about 29 millions sterling per annum to about 16 millions. In other words, when the growth of wealth and population in the meantime is taken into consideration, it will be seen that the charge is now hardly felt. It ought to be added that the above statement of the principal of the debt on the 1st of the current month includes 81 millions sterling of various liabilities which bear no interest, the legal tender notes amounting to nearly 70 of the 81 millions. The debt actually bearing interest amounts to 337,304,080*l.* No such feat as this which we have described has ever been accomplished by any other nation. But it does not necessarily follow that the opinion expressed by European observers fifteen years ago was mistaken. The limitless extent of unsettled land possessed by the United States, the immensity and variety of their resources, the increasing flow of immigration from Europe, and the constant influx of European capital seeking investment, enable them to commit imprudences with comparative impunity which would jeopardize the future of less favoured countries. Yet it cannot be doubted that, even in the United States, unwise taxation, more particularly in the form of protective duties, has retarded material and intellectual development.

Of the 337½ millions sterling of interest-bearing debt still existing, 137½ millions fall due in the coming year, and it is of the mode of dealing with this latter sum that Mr. Sherman treats in the Report just transmitted to Congress. He asks for authority to issue, in place of 80 millions sterling of the amount, Treasury notes bearing interest not exceeding 4 per cent. He expects to place the notes at a lower rate; but even at 4 per cent. he would save 1 or 2 per cent., some of the bonds about to fall due bearing 6 per cent. interest, and the remainder 5 per cent. He wishes to be empowered, therefore, to give as much as 4 per cent. in case of need rather than risk the success of his experiment. For it is an experiment which he is about to try in respect to this particular issue. The Treasury notes are to be so dated that they will fall due in annual series during the next ten years, each series being calculated not to exceed the amount of the Sinking Fund in the year in which it reaches maturity. The result would be the extinction of the whole 80 millions within the ten years, being at the rate of 8 millions per annum, which, as we saw above, is less than the average rate of redemption during the past fourteen years. Supposing he can get these notes taken by the public, Mr. Sherman insures the maintenance of the existing Sinking Fund for another ten years, which is probably one of his reasons for advocating this system of Treasury notes. The Sinking Fund, in fact, is mortgaged by it for ten years to come. But another object, doubtless, is to save the loss incurred by buying bonds in the open market. At present, for example, the Four per Cents. are at nearly 14 premium in New York; and every year that the reduction of the debt continues the premium will go on growing. Thus the United States, which originally borrowed at a very great discount, would have to redeem at a very great premium. For the 80 millions of notes included in the proposal we are now considering this second loss would be avoided, inasmuch as they would be redeemed at par in annual instalments. But this form of investment is very inconvenient. An ordinary person having money to put into securities likes to choose an investment which, besides being safe, easily realizable, and yielding a tolerably good interest, will be permanent. It is an anxious and troublesome thing to make a selection; and, when he has made it, he hates to have the trouble all over again in a few years. These notes will, therefore, be unsuitable for the ordinary investor. But they will be extremely convenient for bankers. They will also serve admirably for purposes of remittance. The credit of the United States stands so high, and the market for United States bonds is so universal, that the notes will doubtless be largely taken by financial firms all over Europe. Still 80 millions is an immense sum, and it is open to question whether it all can be placed. Mr. Sherman himself is not without doubts on the point, and in his second proposal he provides for the contingency.

If the 80 millions of Treasury notes are all placed, there will remain of the amount about to fall due only 57½ millions. But Mr. Sherman has funds to pay off ten millions immediately, so that the residue which he will have to refund is only 47½ millions sterling. Yet he asks for authority to issue bonds for 80 millions sterling. Of course he does not mean actually to issue the whole 160 millions of new debt which he asks to be empowered to create. His real purpose is to place the 80 millions of Treasury notes, if he can, and fund 47½ millions in bonds. But should he be unable to float the whole amount of Treasury notes, he prudently takes power to issue what may remain on his hands in the form of bonds. The bonds are to be redeemable at the end of fifteen years, and Mr. Sherman proposes that they shall bear interest not exceeding 3·65 per cent. The Ways and Means Committee of the House of Representatives, which has more power over financial legislation than the Secretary of the Treasury, because the latter has no seat in Congress, is of opinion that the interest ought not to exceed 3 per cent., and has amended Mr. Sherman's Bill to that effect. How Congress will decide remains to be seen. But if it were more anxious for the success of the refunding operation than to annoy a political opponent, it would unquestionably reject the Committee's amendment. Assuming, for the sake of argument, that the Committee proves to be right, it is not to be supposed for a moment that Mr. Sherman will agree to pay a higher interest than he will find to be necessary. A Secretary of the Treasury has every motive for endeavouring to place his loans at the lowest possible rate of interest. In Mr. Sherman's case the motives are peculiarly strong. He has won a great reputation by his former success in refunding, and by the way in which he has carried through the resumption of specie payments. If now he can borrow at par at 3 per cent., and thus place the credit of the United States on a level with that of England, he will secure a reputation such as no Secretary of the Treasury, not even excepting Hamilton, has ever yet had. Mr. Sherman may therefore be safely trusted to screw down the rate of interest to the lowest possible, and, as a matter of fact, his tendency is to screw it down rather too much. It would consequently be wise on the part of Congress to give him the discretion he asks for.

Mr. Sherman estimates that his scheme will effect a reduction in the interest on the debt of about 2,400,000*l.*, and he recommends therefore that taxes be remitted to the amount of 2,200,000*l.* He is careful, however, not to raise protectionist prejudice against his proposals, for the taxes he selects for remission are all levied on home products. He is, moreover, careful not to interfere with the Sinking Fund. His recommendation keeps well within the saving to be effected in interest; but the rapid extinction of debt can hardly fail to reinforce powerfully the party that desires a reduction in the Customs duties. During the financial year which ended with last June, the actual realized surplus amounted to 13,176,730*l.* In the current financial year, of which five months had elapsed when his Report was presented to Congress, Mr. Sherman estimates the surplus at 18 millions sterling; and in the financial year that will begin with July next he anticipates a still larger surplus, notwithstanding the recommended remission of taxation. This surplus, it is to be understood, is over and above the Sinking Fund. But it is to be supposed that Mr. Sherman recommends a remission of taxation only because he finds the demand for it too strong to be prudently disregarded. If so, it seems only reasonable to assume that people will think an annual surplus of 18 millions too large, and will clamour for a further remission of taxation. The demand, too, is likely to be encouraged by the result of the first remission. All experience proves that a lightening of taxation stimulates consumption, and makes the remaining taxes more productive. It seems scarcely possible, therefore, that the present protective tariff can be maintained for many more years. It must be relaxed for want of an object on which to expend the proceeds. But it is at the same time evident that the tariff will not be touched as long as the Republican party can prevent it. They will prefer, as Mr. Sherman now does, to deal first with the Inland Revenue.

THE SOCIETY OF PAINTERS IN WATER COLOURS.

THIS winter's exhibition of the Society of Painters in Water Colours does not strike us as being particularly fortunate. The gallery contains no doubt a considerable number of works of merit, as well as a not inconsiderable number of works of demerit; but there is, to our thinking, a certain absence of interest in the whole affair. Mr. Alma-Tadema, whose name heads the list of members and associates, contributes nothing; Mr. Boyce's works are conspicuous by their absence; and some other members, whom we need not name, seem to have been bent on proving that, whatever faults may be laid to their charge, they cannot at least be accused of spending too much time on any one work.

A place of honour on the wall at which the patient picture-plodder will naturally look first is occupied, and deservedly occupied, by the Princess Louise's portrait of Lieutenant-Colonel F. de Winton (23), which is a careful and strong piece of painting, and has so lifelike an air that one cannot be far wrong in taking it to be a good portrait. Another important picture on the same wall is Mr. Marks's "The Two Dromios" (35), to which is appended the motto from *The Comedy of Errors*, "Methinks you are my glass, and not my brother." The information thus given in the catalogue would hardly lead any person who studied the catalogue without going to the gallery to suppose that the subject of the picture is a pair of penguins, exquisitely drawn and coloured, and strongly marked with that fine sense of humour of which Mr. Marks is a master, whether he deals with human beings or with creatures whose extent and variety of character only a few artists, painters or poets, are capable of both appreciating and conveying. Mr. Marks is perhaps the only living painter whose humour is at once perfectly fine and simple and perfectly unmistakable. In this work it is particularly unassertive; what he has done is simply a piece of portraiture; but it is portraiture executed by a hand which cannot help catching every trait of the subject, and combining these traits in the happiest and most direct way. It is not uncommon, though it might be well if it were more common, to find a delicate sense of humour allied with an equally delicate sense of poetical beauty; and in this connexion visitors to the old Water Colour Exhibition who have admired Mr. Marks's penguins will do well to turn to two little landscapes which the same painter exhibits (308, 392). The last named is possibly the better work of the two; but both are instinct with a natural appreciation of what is fine in nature, and with the artistic science that gives that appreciation its best expression. Among younger painters, Mr. W. M. Hale comes out remarkably well. A week or two ago we noticed a work of his at the Dudley Gallery, in which various hues of a strong colour were employed and blended with great audacity and success; and in this exhibition we find several works of his which prove that he is as much at home in dealing with low tones as in executing a *tour de force* of a somewhat opposite kind. Mr. Hale sends several specimens of his work, amongst which "Old Houses, St. Philip's, Bristol" (61), and "Monte Salvadore, Lugano" (199), seem to us to be the best. The first named of these is studiously and truthfully low in tone, and is painted with great delicacy; the second is perhaps more striking in subject, and has much strength without any suspicion of over-emphasizing. The painting of the reflection in the water is particularly good. Mr. Herbert M. Marshall contributes several pictures, all of which have merit, but the best of which perhaps are "November's Hail-Cloud" (1) and "Between Newcastle and Tynemouth" (277). The last of these is marked by a pleasing combination of breadth and delicacy. The detail is amply given or suggested without any loss of due proportion, and the general effect is caught and rendered with much skill. The power of marking, subordinating, and harmonizing each part of a subject in this way is not too common, and it is a power which Mr. Marshall seems to possess. Mr. Brewtnall sends five works, of which the largest and probably the most looked at is "The Frog Prince" (124), which illustrates a subject dear to lovers of Grimm. "The Princess looked around to see whither the voice came, and saw a frog stretching out his thick ugly head. 'Ah! Is it you, old water-paddler?' said she. 'I am crying for my golden ball, which has fallen into the water.'" The surroundings which Mr. Brewtnall has given to this engaging incident are pretty and well painted enough, but beyond that we cannot give him any praise. His Princess's figure seems like a caricature of the figures familiar in a school of painting which it is only too easy to caricature, so easy, indeed, that the caricatures sometimes defeat their own object, and his Frog-Prince is, to our thinking, greatly wanting in character and importance. But perhaps no brush but Mr. Marks's could adequately realize the characteristics of a prince who is also a frog. Mr. J. D. Watson is well represented by "Sweethearts and Wives" (117), a soldier in last-century costume drinking a solitary toast. The figure is full of life and feeling. The title suggests once again the notion already suggested by Mr. Marks's "Two Dromios," of the curiously incorrect impressions which might be received by a person who, unable to visit picture-galleries, had a love for collecting picture-gallery catalogues. Such a person would probably entertain an unduly high estimate of a picture which is called "Silvia" (95), and to which are appended in the catalogue the first two lines of the well-known quotation. The work is hung in a particularly good position, is the production of Mr. W. C. T. Dobson, R.A., and is, if not the worst picture, certainly one of the worst pictures in the Gallery. To say this is, as visitors will find out for themselves, to say a good deal; but (also as visitors will find out for themselves) it is not to say too much. Mrs. Allingham sends a good many contributions, all of which have a certain grace and prettiness, and among the best of which perhaps we may rank "Resting" (320). But they all have a certain monotony, both of subject and method, and it might be better to see fewer of them at a time. Mr. North's "Autumn" (72) is markedly distinguished by his exquisite touch and sense of colour in the foreground, and there is a strength in the misty background which has not always been found in his work. The picture is complete; there is in it no sacrifice of general effect to a particular and charming piece of *technique*; and yet the *technique* has not been allowed to lose any of its charm. It is, in a word, admirably composed as well as admirably painted. Out of Mr. Albert Goodwin's pictures we select for special praise "The English Cemetery at Rome" (240), which is admirably painted, and has a good deal of originality. The sky full of "mare's tails" is especially good and striking. Mr. H. Moore's works are, as might be expected, capital. One of the most attractive among them is "Landing a Yarmouth Hawse-Boat" (109), in which the tumbling waves have a great deal of "go" and movement. Mr. Wallis's "In the Uffizi Gallery, Florence" (237), is a pleasing and attractive work, in which the representation of the stained and weather-beaten marble of the statue which is the principal object of the picture strikes us as being particularly happy. The figures of the spectators are less fortunate, but that perhaps is a matter of minor importance. Mr. Thorne White's "Parham Park; Outdoor Sketch" (231) is a curiously sprawling work, in which a little group of figures seems oddly put in, possibly, of course, because they happened to be there. Mrs. Angel's pictures of still life are, as usual, charming, and we may call special attention to her "Roses" (66) and "Spring Gatherings" (213). Miss Clara Montalba sends twelve pictures, none of which seem to us to be in her happiest vein. Mr. Paul Naftel's "Morning" (70) is in his best manner. A special feature in the present exhibition is the "Dodgson Loan Collection" shown on some of the screens. The works exhibited afford an interesting study, but happily do not lead one to despair of the present state of water-colour art. What is remarkable in most of the pictures is a fine sense of light and atmosphere, which is too often allied with a conventional and meaningless arrangement of figures. In some cases, also, it will be observed that the painter aimed, boldly enough, at more than it was given to him to accomplish.

We have spoken of this exhibition as being in some ways unsatisfactory, and it seems desirable to point to a few glaring instances of pictures which ought not to have been shown. What could have induced Mr. J. D. Watson to paint so hideous and repellent a picture as "A Bather" (312) is perhaps not a more difficult question to answer than "What could have induced anybody, when it was painted, to hang it?" It is hardly more easy to imagine what models, human or feline, Mr. Smallfield can have had for his "Dame Wiggins" (228), and how, giving him every chance in the direction of bad models, he can have "imitated them so abominably." With these two works we must, we fear, class Mr. Walter Duncan's "With Stream and Wind" (209), in which we have the old, old pair of lovers in an impossible boat, drifting down an impossible stream, bordered by (most happily) impossible rushes.

REVIEWS.

GÜNTHER'S INTRODUCTION TO THE STUDY OF FISHES.*

DR. GÜNTHER'S recently published *Introduction to the Study of Fishes* fully sustains the high reputation of the author. To the exceptional opportunities of research which he has had as Keeper of the Zoological Department of our great national collection, Dr. Günther adds the indispensable qualities of a philosophic habit of generalizing from facts, and a logical method in drawing out and stating his conclusions. No one is entitled to speak with higher authority in this special department of natural history. Invited to revise or rewrite the article on Ichthyology for the new edition of the *Encyclopædia Britannica*, he felt impelled at the same time to undertake a Handbook of Ichthyology, in which he could allow himself wider scope and greater amplitude of technical treatment than was compatible with an abstract condensed for the wants of the general reader. There has long been a call for some concise and systematic treatise dealing with the structure, classification, and life-history of fishes. The only publication which Dr. Günther could point to as in part satisfying these requirements was the article on the same subject prepared by the late Sir J. Richardson for the last edition of the *Encyclopædia*. The mass of material scattered up and down in the pages of special memoirs, notices, and Transactions have been laid under contribution for the purpose of the present work, combined with the larger and more methodical class of writings which form the bulk of the literature of ichthyology. The great work of Cuvier and Valenciennes, left incomplete by those masters of the science, has been supplemented by the labours of later naturalists, who have given detailed accounts of orders omitted in the *Histoire*

* *An Introduction to the Study of Fishes.* By Albert C. L. G. Günther, M.A., M.D., Ph.D., F.R.S. Edinburgh: Adam and Charles Black. 1880.

naturelle. The Plagiostomes have been described by Müller and Henle, and the Murænidæ and Lophobranchii by Kaup. M. A. Duméril's splendid *Histoire naturelle des Poissons ou Ichthyologie générale* has got as yet no further than two volumes, the first containing a complete account of the Plagiostomes (Paris, 1865), and the second treating of the Ganoids and Lophobranchs (Paris, 1870). Dr. Günther's valuable *Catalogue of Fishes*, published by the Trustees of the British Museum in eight volumes (London, 1869-70), did much towards bringing together in one comprehensive work the results of the manifold researches carried on by independent inquirers in every department of ichthyology during this interval of unexampled activity. Besides the species previously described, many new forms were added, bringing up the total number of species referred to in those volumes to 8,525. In the systematic arrangement of families and orders Müller's system was followed in the main, with some modification in point of definition. The work now before us may be regarded as giving in a condensed form, adapted to the needs of the student, a survey of the science of ichthyology in its latest stage of progress. Besides meeting the requirements of those who would systematically master the elements of the science, it is fitted to serve as a book of reference for zoologists in general, or as a manual for the use of travellers or followers of sport who wish for ready information on matters relating to fish life.

The opening chapter on the history and literature of the subject gives a valuable summary of the progress of research from the days of Aristotle, who shows a perfect knowledge of the general structure of fishes, clearly discriminating them from the aquatic animals which have lungs and mammæ—*i.e.* cetaceans—as well as from the various groups of aquatic invertebrates. From the time of this gifted and accurate observer, with the exception of a small poem in which Ausonius describes from his own observations the fishes of the Mosel, Dr. Günther finds either total silence or no more than vague or fabulous notices among classical writers or their successors in literature until far on in the sixteenth century. In the elder Pliny, at least, he might have met with some evidences of a better kind of knowledge, the section on fishes having really a worth beyond most of that garrulous naturalist's history. The culinary gossip of Paulus Jovius has rightly been passed over in silence. It was with Belon, Rondelet, and Salviani that ichthyology entered upon the stage of really scientific existence. For a century or so their authority continued to hold rule among naturalists, though much was done by the exertions of investigators in foreign countries, especially in the Spanish and Dutch settlements in the New World. Piso and Margrav made known the fishes of Brazil, adding one hundred species to those previously catalogued. In Europe at the same time anatomical schools and academies led to the careful investigation of the internal anatomy of the most prominent native forms. Foremost at this time were the names of Borelli, Malpighi, Duverney, and the famous anatomist Swammerdam. A new era began with our own countrymen, Willughby and Ray, who were the first to recognize the true principles whereby the natural affinities of animals were to be determined. Amongst the primary and essential points of their method was the determination of species as the base upon which all sound zoological knowledge must be built up. Upon the lines laid down by them Artedi of Sweden worked out the system which entitled him to be called the father of ichthyology. Drowned by accident in 1784, when but twenty-nine years old, Artedi left MSS. of the highest value, which were edited by his fellow-pupil Linnæus. So perfect was Artedi's method that even Linnæus, Dr. Günther says, could but modify and add to it, doing little more than apply binominal terms to the species properly described and classified by Artedi. The works of Artedi and Linnæus gave a new impulse to the study of the aquatic fauna, not only in Scandinavia, but in Holland, Germany, and England. Naturalists attached themselves to the expeditions of adventurous voyagers—among them the two Forsters, father and son, Solander, who accompanied Cook, and Commerson, who travelled with Bougainville. The researches of Bloch and Lacépède carried on the systematic study of the anatomy and physiology of fishes to the time of Cuvier, who from the year 1820 set himself to the pursuit of ichthyology, not merely as a part of the *Règne animal*, but from a particular predilection for the study. He was assisted by one of his pupils, Valenciennes, who, after Cuvier's death in 1832, carried on the work at intervals, leaving it, however, still unfinished with the twenty-second volume (1848), which treats of the Salmonoids.

A short but clear analysis of Cuvier's system is given by Dr. Günther, who, pointing out its occasional defects and inconsistencies, dwells upon the immense stride which ichthyology had made in the seventy years that had elapsed since the time of Linnæus. Extending his researches into the field of palæontology, Cuvier was the first to make good the points of resemblance between large classes of existing fishes and their fossil representatives or ancestors, thus laying a foundation upon which has been largely built up the modern theory of the continuity of life from its earliest vestiges until now. An undue absorption in the study of fossil forms was the cause of Louis Agassiz losing in part the vantage-ground gained by Cuvier. Whilst opening up a whole new sub-class of fishes in the Ganoidei, he failed to see how artificial was the classification of fishes which he based on the mere structure of their scales. The distinctions between cycloid and ctenoid scales, between the Placoid and Ganoid orders are, as Dr. Günther points out, extremely vague, and hardly to be maintained. This system has shared the fate of every classification based simply upon the modifications of a single organ. To the discoverer of the Ganoidei succeeded their explorer, Johannes Müller, whose system, if not absolutely natural in all its arrangements, requires no more than modifications in detail and more exact definition to suit itself to the order of nature which it is the task of every true biologist to subserve. The comparative outlines of the systems of these two great men, given by our author, show in how many points the families established by Cuvier were re-examined and better defined by Müller. His own discussion, modestly referred to here, of the recovery (in the year 1871) in the Ceratodus of a genus long thought extinct—allied in form, as he showed, to Lepidosiren, though, on the other hand, not to be separated from the Ganoid fishes, Lepidosiren being proved thereby a Ganoid—led to a further modification of Müller's sub-classes, and the result is the thoroughly natural system followed in the present work. A list of all the more important books or monographs illustrative of this special branch of zoology which have appeared subsequently to the labours of Cuvier enables the student to lay his hand readily upon the best authority and guide in whatever direction his research may take. These works are for convenience arranged under three heads. 1. Voyages, containing general accounts of zoological collections in French, English, and German. 2. Faunæ, or standard works on the natural history of the marine and fresh-water fishes of various geographical zones and of both hemispheres, special mention being made of Bleeker's *Atlas Ichthyologique des Indes Orientales Néerlandaises* (Amsterd. fol. 1862), interrupted by the author's death, in 1878—a splendid work, yet defective in system, and limited to the external characteristics of each specimen, omitting the anatomy, physiology, and habits of fishes. 3. Anatomical works, too numerous for an exhaustive catalogue; the most prominent and instructive being commended to the student's choice, while his inquiries are directed to the general arrangement or special organs of fishes, their osteology, histology, or embryology, their electric organs, or their metamorphosis, as in the case of the lamperns. Besides the works of Owen and Huxley, the *Zootomie der Fische* of H. Stannius is recommended as the most comprehensive manual of the anatomy of fishes.

As the general result of so many ages of labour, the views of ichthyologists have at length converged to the definition of fishes as that class of vertebrate animals which, living in water, breathe by means of gills or branchiæ; whose heart consists of a single ventricle and single atrium; whose limbs, if present, are modified into fins, supplemented by unpaired, median fins; and whose skin is either naked or covered with scales, or osseous plates or bucklers. Not that the lines of this definition are to be taken as absolutely sharp and clear. There are, our author admits, not a few members of the class of fishes in which a modification of one or more of those characteristics may be seen, but which, notwithstanding, cannot be separated from it. Moreover, the distinction between the class of fishes and that of Batrachians is very slight. The first half of Dr. Günther's work treats with great minuteness on those points of the internal and external structure of fishes which are to be taken as indices for establishing these points of difference. By the aid of admirable woodcuts he makes clear the anatomy and the homologies of the skeleton, the muscular and electric organs, the nervous system, with its relation to the spinal cord and brain and the sensory system, with critical remarks upon the sense of hearing in fishes, which in many families, as in the Percoids and Clupeoids, has a peculiar relation with the air-bladder. The organs of nutrition and digestion, respiration, circulation, and reproduction, having been amply discussed, a chapter is given to the phenomena of the growth and variation of fishes, the changes dependent upon sexual development, with the secondary differences peculiar to certain families, the classification of mixogamous, polygamous, and monogamous fishes, and the changes traceable to domestication and acclimatization. The distribution of fishes in point of time opens up an interesting chapter on palæontology. Can the existing types be shown to be identical with those which first peopled our seas, rivers, and lakes? and has the stream of life come down in an unbroken line from the earliest dawn of geological time? In the Upper Silurian rocks the first undeniable evidence of a fish—spines and scales, apparently, of a plagiostome—our author believes is to be found. What appears to be the jaw of a fish may possibly find a place among the Ganoids. In the Devonian or Old Red sandstone there are fish remains distinctive enough to be referred to several genera; the Ganoids in particular being so well preserved that their general aspects and habits may be very clearly made out, such especially as were provided with hard carapaces, solid scales, and ordinary or bony fin rays. Of the Devonian Ganoids Dr. Günther instances one which approaches the still living Polypterus, and a second in which the principal characters of the Dipnoi are so strongly manifest as to admit no more than a family separation between them. The continuity of form is traceable through the Carboniferous and Permian series, and may be seen to grow in distinctness as we pass on towards the existing fauna. It is interesting to mark the falling out of genera by the way. In the Cretaceous group the Palæichthyes are already in a minority, whilst many Teleosteans have appeared for the first time in numerous genera, many of them identical with still existing fishes. In the Tertiary epoch the Teleosteans have all but superseded the Ganoids, of which the few remaining species are closely allied to existing forms, such as Lepidosteus, Amia, Hypamia, and Acipenser. In geographical distribution the fishes of earlier epochs differed widely from those of our day, owing in part to climatic changes, in part to modifications of

the earth's surface whereby the waters have become by turns fresh and salt or brackish. In the changes of species constantly going on between the fresh-water and marine faunæ, and the consequent difficulty in drawing sharp dividing lines of families and groups, is involved many a problem for the ichthyologist. The division into three principal zones, with sub-regions characterized by their attendant families, wherewith our author closes this part of his work, will be found of immense assistance to the student.

In the systematic and descriptive part which forms the latter half of the volume the reader obtains a clear view of the natural system of classification of fishes. Each of the sub-classes—Palæichthyes, Teleostei, Cyclostomata, and Leptocardii—has its distinctive characteristics laid down, with the modifications which determine the secondary division into orders, sub-orders, and families. Of the method herein employed, or the amount of special knowledge brought to bear upon this masterly compilation, at once a catalogue and an analysis of the whole phenomena of fish-life, our limits do not allow us to give any adequate idea. The student is to be envied who, with this manual in hand, will shortly enjoy free access to the great collection of specimens now being gathered together for his use in the spacious galleries of the Natural History Museum at South Kensington.

THE PERSONAL LIFE OF DAVID LIVINGSTONE.*

THE title that Dr. Blaikie has given to this book shows that he was well aware of the difficulties that lay in his path. Livingstone, in his books of travels and in the journal which was published after his death, had given so full an account of the great work of his life that not much might seem at first sight to be left for a biographer. Dr. Blaikie, therefore, professes to write, not so much his Life, as his Personal Life. He chiefly aims, we assume, at showing, not what the man did, but what he was. The two subjects however cannot, of course, be kept separate, though a writer can dwell more on the one part than on the other. He can, moreover, in a way that would be unbecoming in one who describes his own doings, enter into personal details which are often of the highest interest. He can show how the character of his hero was slowly trained, till at last it became fit for the grand task of his life. He can add many touches from letters and journals to prove that that almost childlike simplicity which is so commonly found in the greatest men was not in this case wanting. Lastly, he can quote the testimony of others, and let us see the way in which the conduct of his hero was regarded by those who were most about him. This is what Dr. Blaikie has chiefly aimed at doing, though, to make his narrative complete, he has given at the same time a tolerably full account of Livingstone's travels. Though we cannot look upon the narrative as altogether worthy of its subject, yet we feel that, on the whole, we ought to be satisfied. The author has certainly surpassed the average of biographers, and has given us a book which, if here and there it affords matter for censure, at all events can be read with much interest. If, according to the immortal criticism given in the *Vicar of Wakefield*, it might have been better had the author taken more pains, on the other hand it might very easily have been a great deal worse had less pains been taken.

The story of Livingstone's early days will be read with by no means the least interest. He belonged, as he always remembered with pride, to "the honest poor." "My own order, the honest poor," he wrote when he was at the height of his fame. When he was a child he had learnt from his grandfather the history of his family for six generations back. The old man had never heard of any of its members who had ever been guilty of dishonesty. In the inscription that Livingstone wrote for the tombstone which he set up over his parents' grave, he showed his pride in his birth:—

TO SHOW THE RESTING-PLACE OF
NEIL LIVINGSTONE,
AND AGNES HUNTER, HIS WIFE,
AND TO EXPRESS THE THANKFULNESS TO GOD
OF THEIR CHILDREN,
JOHN, DAVID, JANET, CHARLES, AND AGNES,
FOR POOR AND PIOUS PARENTS.

It is well known how laboriously his youth was spent; how he worked in a factory from six in the morning till eight in the evening, and how, when his body could at length rest, he toiled each evening over his books. Even during the daytime he had kept his book on a portion of the spinning-jenny, and had devoured it by snatches. His, indeed, was a hard youth, but it was not an unhappy one. He looked back upon it with pleasure, and, so far from regretting it, he believed that it had been an admirable training for the great work of his after life. Had it been possible, he said, he would have liked "to begin life over again in the same lowly style, and to pass through the same hardy training." Dr. Blaikie tells us that "he ridiculed Mrs. Beecher Stowe's notion that factory-workers were slaves." Well indeed he might, for he was a countryman of Burns, and had never thought of hanging his head for honest poverty. It is interesting, by the way, to know that, as he roamed alone through the wilds of Africa, even in the midst of the horrors of the slave-trade, he kept up his heart by thinking of the good time coming, and by humming to himself:—

When man to man, the world o'er,
Shall brothers be for a' that.

When he was spending on fresh explorations the money which he had so hardly earned by his first book, he wrote to Sir Roderick Murchison, "People who are born rich sometimes become miserable from a fear of becoming poor; but I have the advantage, you see, in not being afraid to die poor." When he heard that the Boers in his absence had wrecked his house, had torn up his books, scattering the leaves all about, and had carried off everything that they did not break, he wrote to his wife, "Well, they cannot have taken away all the stones. We shall have a seat in spite of them, and that too with a merry heart which doeth good like medicine." He had always been used to make the best of everything. His father had been in the habit of locking the door of his house at dusk, by which time all the children were expected to be in. "One evening David had infringed this rule, and when he reached the door it was barred. He made no cry nor disturbance, but, having procured a piece of bread, sat down contentedly to pass the night on the doorstep. There, on looking out, his mother found him."

As Dr. Blaikie justly says, "the fellow-feeling he acquired for the children of labour was invaluable for enabling him to gain influence with the same class, whether in Scotland or in Africa." It was not only that he was a thoroughly good craftsman himself. It was not only that he was a good hand at "building, gardening, cobbling, doctoring, tinkering, carpentering, gun-mending, farriering, and wagon-mending," though this was much. It was not only that he was always ready to do things that would have been intolerable, to use his own words, to a man of clerical dignity. He had, besides, that thorough sympathy with those who get their living by the sweat of their brow, and that complete understanding of the way in which they look on the world, which is at once so hard for a man born among the rich to acquire, and at the same time so needful for those whose work lies among the poor. He knew the power of gentleness and kindness. "Depend upon it," he wrote in the instructions which he gave to those who were under him in his expedition to the Zambesi, "Depend upon it, a kind word or deed is never lost." At another time he stated, as the result of his long experience, that "the polite, respectful way of speaking, and behaviour of what we call 'a thorough gentleman,' almost always secures the friendship and good-will of the Africans." He was never troubled by that feeling of condescension which troubles even good men when they mix with those who have been born in much poorer circumstances than themselves. What he did, he did quite naturally. A lady had written to reproach him that he seemed to have forgotten the chief part of a missionary's duties. He thus wrote back in reply:—

Nowhere have I ever appeared as anything else but a servant of God, who has simply followed the leadings of His hand. My views of what is *missionary* duty are not so contracted as those whose ideal is a dumpy sort of man with a Bible under his arm. I have laboured in bricks and mortar, at the forge and carpenter's bench, as well as in preaching and medical practice. I feel that I am "not my own." I am serving Christ when shooting a buffalo for my men, or taking an astronomical observation, or writing to one of His children who forget, during the little moment of penning a note, that charity which is eulogized as "thinking no evil."

It was in patient continuance in well-doing, as he often used to say, that the true road to influence lay. It was by following this road, without turning for one moment to the right hand or the left, that he was able to pass nearly twenty years in Africa without having once to lift his hand against a fellow-man. It was in 1841 that he landed at the Cape and went up far among the wild tribes. It was not till 1861 that he was attacked by the natives and was forced to repel the attack with violence. "I'll do anything for peace, except fighting for it," he had at one time said. But at last the time came when even he was forced to fight, and to fight for peace. He had got into the midst of a savage tribe which, in the hunt after slaves, had been wasting all the country round with fire and sword. Livingstone and Bishop Mackenzie had gone up in the hope of turning the chief from his murderous ways, and had been attacked by him with the utmost violence. Next to his gentleness it was his truthfulness which won over to him the hearts of men. His return from England to Loanda, so that he might, in accordance with his promise, lead back his faithful Makololo their year's journey through the wilderness home was never forgotten. It is interesting to compare with this act of faithfulness on his part a striking note in his journal. He wrote it on the evening of a day when he was in the greatest peril. His passage across the Zambesi was threatened by a hostile tribe, and he had but little hope that he should escape with his life:—

Evening.—Felt much turmoil of spirit in view of having all my plans for the welfare of this great region and teeming population knocked on the head by savages to-morrow. But I read that Jesus came and said, "All power is given unto me in heaven and in earth. Go ye therefore, and teach all nations—and lo, *I am with you alway, even unto the end of the world.*" It is the word of a gentleman of the most sacred and strictest honour, and there is an end on't. I will not cross furtively by night as I intended. It would appear as flight, and should such a man as I flee? Nay, verily, I shall take observations for latitude and longitude to-night, though they may be the last. I feel quite calm now, thank God.

When he wrote "It is the word of a gentleman of the most sacred

* *The Personal Life of David Livingstone, LL.D., D.C.L., chiefly from his Unpublished Journals and Correspondence in the possession of his Family.* By William Garden Blaikie, D.D., LL.D., New College, Edinburgh. With Portrait and Map. London: John Murray. 1880.

and strictest honour," he might have had in mind Decker's lines, but it is scarcely likely that he knew them:—

> The best of men
> That e'er wore earth about him, was a sufferer;
> A soft, meek, patient, humble, tranquil spirit,
> The first true gentleman that ever breathed.

Livingstone, according to Dr. Blaikie, owed his gentleness to his mother. "She was," our author writes, "a delicate little women, with a wonderful flow of good spirits . . . Her love had no crust to penetrate, but came beaming out freely like the light of the sun. . . . It was the genial, gentle influences that had moved him under his mother's training that enabled him to move the savages of Africa." His great strength and persistence of character were due in part to that severe training in the school of poverty which we have already mentioned, and in part to the religious teaching of his puritanic home. His father, as he himself has said, was of that high type of character portrayed in the *Cotter's Saturday Night*. In this training, with much that was good there was usually much of narrowness. Happily Neil Livingstone, while he was fond of old Scottish theology, was also deeply interested "in the progress of the world," as he called it. Yet he had a fear of books of science, deeming them unfriendly to Christianity. As for novels, he would never allow one to enter his house. While we remember the many great men who have been raised up under the severe training of those Northern homes, we ought at the same time never to forget how many have been utterly ruined by its unnatural severity. The Scottish Sabbath, when it claims its heroes, must not be allowed to pass over in silence its worse than failures. Happily Livingstone had a natural greatness of mind which enabled him, each year that he lived, to shake himself free of the burdens that men had laid on his back. In his travels in Africa he freed himself, as well as others, from the shackles of slavery. When he had arrived at the mouth of the Zambesi, and was detained in the fever-breeding region of mangrove swamps, at a time when he himself was suffering from illness, he did not hesitate to work hard one Sunday in getting disembarked the sections of his river steamboat. He not only wanted to save time, but also he had found that active exercise every day was one of the best preventives of fever. "Some of his friends," writes Dr. Blaikie, "were troubled, and many reflections were thrown on him." We should like to sentence such precisians as these to only one Sabbath in a mangrove-swamp. It might possibly enlarge their hearts as well as their understandings. It is very rarely that we discover any narrowness in Livingstone. On one occasion, however, he certainly shows that he had not mastered the lesson that was taught by the fall of the Tower of Siloam. He is describing how the Boers, at the time when they sacked his house, had ruthlessly murdered the natives amongst whom he had been living and labouring. He writes to one of his friends, "The Boers kill the blacks without compunction, and without provocation, because they believe they have no soul . . . Viewing the dispensation apart from the extreme wickedness of the Boers, it seemed a judgment on the blacks for their rejection of the Gospel. They have verily done despite unto the spirit of grace." In his later years he could never have written such words as these. By that time he had shaken himself wholly free from the bondage of bigotry. On one of his visits to Scotland he was asked to speak in the chapel where he had been a worshipper in his youth. He spoke of the divisions in the Church, and "of the broadening process that had been going on in his own mind while in Africa, which made him feel himself more than ever the brother of all." He went on to say, "I am sure I look on all the different denominations in Hamilton and in Britain with feelings of affection. I cannot say which I love most. Really, perhaps, I may be considered a little heterodox; if I were living in this part of the country, I could not pass one Evangelical church in order to go to my own denomination beyond it."

It is by no means surprising that his real greatness of character was not discovered in his early days. After three months' trial he was almost rejected as a missionary by the London Missionary Society. Little did the reverend gentleman who sent in an unfavourable report of him think that the only chance he himself had of being remembered was as the man who lived in the same house with Livingstone for three months, and failed to find out that his was a great mind. "None of his friends," writes Dr. Blaikie, "seems to have had any foresight of the eminence he was destined to attain. The Directors of the Society did not even rank him among their ablest men." Many years later, when he had given undoubted proofs of his strong and noble character, his Directors were still blind to the transcendent merits of their famous missionary. He was bent on "passing on." He had no thought of settling down in a comfortable home, as so many others did. To one of his friends he wrote, "If you meet me down in the colony before eight years are expired, you may shoot me." He told his Directors that he was at their disposal, "to go anywhere—provided it be forward." "Can the love of Christ," on another occasion he wrote, "not carry the missionary where the slave-trade carries the trader?" But his proposals were not accepted, for they lay out of the beaten path which is so dear to men of ordinary minds. To the Society's agent he made a noble defence of his plan for opening up a path for the teeming population of the interior. "I have been," he said, "seven times in peril of my life from savage men while laboriously and without swerving pursuing that plan, and never doubting that I was in the path of duty."

Even when he had happily freed himself from the control of the Society, he still did not always meet with the treatment which he deserved. So late as 1865, when he was setting out on his last journey, the Foreign Office "propounded a scheme that he should have a commission," giving him certain authority. When a formal proposal was submitted to him it contained "the additional proviso that he was to be entitled to no pension." As for a pension, he had never asked for it. "When Earl Russell was appealed to, he would only promise a salary when Dr. Livingstone should have settled somewhere." The Geographical Society did not treat him with much more respect in the agreement that it made with him. "For mere board and no lodgings," he indignantly wrote, "I was to work for years and hand over the results to them." But nothing could repress the noble ardour which inspired him. "I don't know," he at one time wrote to one of his friends, "whether I am to go on the shelf or not. If I do, I make Africa the shelf." When he seemed to be lost to us then was his great worth seen, and then no efforts were spared to recover him from "the dark continent," whence for so long a time no tidings of him came. In Westminster Abbey such honour was done to him as can be done to the dead; but we know not whether he would not have better found his last resting-place where he had once wished that it might be. "I have often wished," he wrote, "that it might be in some far-off, still, deep forest, where I may sleep sweetly till the resurrection morn, when the trump of God will make all start up into the glorious and active second existence."

SPINOZA.*

SPINOZA is one of those thinkers who are destined to be not without honour save in their own age. From the very interesting sketch of the history of Spinoza's reputation which Mr. Pollock gives us in his concluding chapter we can see that the causes of the temporary neglect are also those of the subsequent appreciation. Spinoza was a man clearly in advance of his age, and he had to suffer the penalties attaching to all inconvenient precocity. He broke too completely with the reigning scholastic and theological modes of thought in his views on nature, man, and the objects of human life, to escape the full intensity of the *odium theologicum*. But, in thus parting company with contemporary ideas, he was moving towards modern modes of conception. His was a mind in many ways touched by the modern spirit. Consequently there has naturally arisen a reactionary movement of admiring appreciation. And this movement has been sustained by the powerful attractions belonging to Spinoza's personality. The picture of the learned and meditative Jew quietly plying his humble craft, undismayed by social persecution, and not disturbed by vain social ambitions, but just content with ennobling his meagre surroundings and homely activities with lofty thoughts into which others could not enter, and with a high moral ideal—this picture which Mr. Pollock paints for us with a fine artistic touch is one which could not fail to have a charm for those, of whom the first was Lessing, who may be said to have discovered Spinoza for our century. It may be added that even those whose principles obliged them to reject Spinoza's teaching have confessed to the charm of his character. Thus Voltaire writes of "le sophiste géométrique Spinosa, dont la modération, le désintéressement et la générosité ont été dignes d'Epictète."

The first thing that strikes one is that the modern appreciation of Spinoza has begun and has been most extensive among those who stand outside the philosophic circle. This is at first sight surprising; for, if ever there was a thinker who, by the difficulties of many of his conceptions—which were fully exposed by contemporary critics, and more particularly by Tschirnhausen—and the severity of his method, might antecedently be supposed to address himself specially to the philosophic caste, it is surely Spinoza. To read him even with the aid of Mr. Pollock's able exposition, with its simple language and its familiar conceptions, is often sufficiently difficult; and in the original he seems to us, in the external manner of his philosophizing, quite as repellent to the ordinary literary mind as Kant himself. Yet men so little given to a special study of philosophy as Lessing and Herder, Goethe, Heine, Auerbach the novelist, and, in our own country, Shelley and Mr. Matthew Arnold, have been powerfully attracted to Spinoza, and have acknowledged his profound influence on their mental development. And while the literary and poetic mind has thus been impressed by Spinoza's teaching, the modern scientific intellect is, according to Mr. Pollock, turning more and more towards him. To account for this far-reaching and growing influence of Spinoza without as well as within the philosophic circle may be said to be one object of Mr. Pollock's volume. To understand this we must go below the surface of his philosophy, though it is possible that there may be something in its geometric exactness and symmetry of form which has exerted a charm on some minds. The power of Spinoza resides partly in his speculative theories, but much more in the ethical teaching for which these are the preparation. In spite of its scholastic dress, Spinoza's system is a great simplification of previous philosophy, and in many ways an approach to a positive scientific conception of the world and man. Moreover, it is made to yield a moral doctrine which has a singular beauty and grandeur, and

* *Spinoza: his Life and Philosophy.* By Frederick Pollock, Barrister-at-Law, late Fellow of Trinity College, Cambridge, &c. London: C. Kegan Paul & Co. 1880.

which may compare favourably with the highest ethical constructions of ancient and modern times.

The philosophy of Spinoza has its ancestry in the teaching of Descartes on one side, and on the other in that of the Arabic and Jewish schools. The question of the amount of influence due to each of these two sources, as also to Neo-Platonism working through Giordano Bruno, is ably discussed by Mr. Pollock in the full light of recent research. He points out that too much has been attributed to the influence of Descartes, who supplied him with little if anything beyond his physics. Yet his own view seems perhaps to err slightly in the other direction. The influence of Descartes appears to be discernible not only in Spinoza's whole method, which is simply Descartes's mathematical conception of philosophy more fully elaborated, but also in many of the details of his teaching; for example, in the peculiar use of the term objective, p. 131, in the account of the emotions, which is by no means so different from that given by Descartes as Spinoza would have us believe. But, while thus fettered by the shreds of scholastic forms, Spinoza was, according to our author, feeling his way towards a scientific *Welt-anschauung.* The mythical element derived from Jewish tradition became less and less prominent as he developed his system, while the scientific element came more clearly into sight. Mr. Pollock avowedly looks at Spinoza from the point of view of modern science, and seeks to emphasize those aspects of Spinoza's system which approach modern forms of thought. It seems probable that, with all the care which the author has taken to mark the interval between the age of Spinoza and our own—as when, for example, he rightly distinguishes between Spinoza's impulse of self-preservation (*conatus*) and the same idea in the hands of Mr. Darwin (p. 117)—he tends, on the whole, to exaggerate the amount of affinity. It is always difficult not to import our own way of thinking into the words of a remote writer whom we are strongly desirous of understanding; and when there is a conscious attempt to connect such a thinker with the present, the illusion of a too great propinquity is almost certain to arise. There is no doubt that, as compared with Descartes, Spinoza is scientific. His sweeping away of the dualisms left by Descartes—namely, that between God and the world as a whole, between the two substances mind and matter, and between man and human life and nature—all this is clearly a simplification of our conception of the universe which exactly answers to the scientific spirit. And this all-embracing unity is doubtless that which has attracted men like Goethe, who thus describes the effect of Spinoza on his mind:—"I found here that which stilled the emotions; a wide and free prospect over the physical and moral world disclosed itself before me" (p. 395). More than this, it is obvious that by his elimination of final causes, his denial of free will, and the naturalistic view of the world and human life resulting from those negations, Spinoza approached the positive standpoint of modern science. But when we have said this we have said all, so far as the speculative part of Spinoza's teaching is concerned. To say, as Mr. Pollock does, that the monistic view of Spinoza—namely, that every physical process has its mental correlate, conscious or unconscious, and that both are but two aspects of one process—is the modern scientific view, appears to us somewhat to confuse the boundaries of science and metaphysics. So far as M. Taine and G. H. Lewes, or any other modern writers, hold this view, they do so much more *quâ* metaphysicians than *quâ* scientists. One may concede that at more than one point Spinoza's doctrine touches the results of modern physiological psychology. In his conception of the psychical and the physical chain of events as each complete in itself, he undoubtedly made a brilliant anticipation of modern teaching. And, more than this, it may be allowed that this later teaching fits in very well with the metaphysical view of Spinoza. Yet there is clearly no necessary relation between them, and a man may accept all the teaching of modern science and remain in the end a pure idealist, equally opposed to every theory of absolute substance or things-in-themselves. Whether or not science leads a man on to philosophic monism is largely a matter of individual mental organization. We suspect that this is substantially Mr. Pollock's own view; yet his words easily seem to imply more. To identify Spinoza's philosophy and modern scientific thought overmuch appears to us to leave the effect of this philosophy on men like Goethe and Heine unexplained. To them it was surely the final unity of the "world-all," the vision of the phenomenal world of individual things playing like surface waves upon the vast and deep ocean of real existence, which appeared so fascinating an element in Spinoza's teaching. One may perhaps go further, and doubt whether, even supposing that modern men of science must have a seventeenth-century metaphysic, Spinoza's system is the most modern. Mr. Pollock touches on the objection brought against Spinoza's philosophy by Schelling and Hegel that it is "lifeless, rigid, motionless," but appears to regard it as hardly intelligible (p. 398). Yet an evolutionist must certainly miss much in Spinoza, the want of which he might describe very well in the words here used. Spinoza's system gives us nothing but the statics of existence, determines the relation of individual things to the underlying attributes, and of these again to the uniting substance, conceived as co-existent one with another. While he gains a glimpse of the truth of a gradation of being, he makes no use of this in explaining the development of things. In truth, it is evident from his general disregard of the category of time in looking at the world—which category, to judge from his peculiar doctrine of the eternity of intellectual existence, he appears to think altogether unreal—as well as from his incapacity to conceive social and political institutions as a process of growth and adaptation, that he had no glimmering of those ideas of progress and development which were to fill the air at the close of the following century, and to which Schelling and Hegel, each in his own way, tried to give philosophic expression. Looked at on this side, Spinoza's system seems to be far less modern than that of Leibnitz, which not only comes much nearer to recent scientific ideas of matter in its conception of monads, but in which the idea of development plays so conspicuous a part. And, as a matter of fact, we suspect that in Germany at least—to judge, among other signs, by a curious essay on the relation of the ideas of Leibnitz to modern scientific conceptions not long since published by Du-Bois Reymond—the influence of Spinoza's successor on the modern scientific mind is far greater than his own. If we add to this the truth, fully admitted by Mr. Pollock, that Spinoza does not draw the obvious distinction between the relation of mind and matter as coexistent events on one side, and as aspects of cognition (subject and object) on the other; that, in point of fact, he has no theory of knowledge, and so cannot render an account of those mental processes which all science assumes, as the system of Hume or of Kant can do, it seems vain to expect, as Mr. Pollock's words appear to imply (p. 399), that Spinoza is to become *the* philosopher of men of science.

That Spinoza will still attract men of science as well as others we can readily believe; but he will do this, we suspect, much more on the practical than on the theoretical side. It is pretty certain that, even with a mind like Lessing's or Goethe's, it was much more the ethical unity which Spinoza brought into human life than any theoretic unity which he brought into the universe that drew and fascinated. Goethe, indeed, says in the passage already referred to, "What chiefly drew me to Spinoza was the boundless unselfishness that shone forth in every sentence." And the same may perhaps be said of Mr. Pollock himself. Kant, in working out his ethical system, had to reintroduce hyper-empirical ideas, such as freedom and immortality, which he professed to have rejected in his speculative system. Spinoza does nothing of the sort. In spite of the decided flavour of mysticism about the curious doctrine of the intellectual love of God, the difficulties of which tax all Mr. Pollock's resources (p. 289), the practical teaching of Spinoza is, as a whole, thoroughly human and naturalistic. As Mr. Pollock more than once points out, it has marked affinities with the Stoical doctrine; though it is highly improbable that Spinoza was intimately acquainted with this or indeed with any of the classical systems of philosophy.

The full and interesting account of Spinoza's ethical teaching here given us may be read with profit by men of all views. One could hardly find a finer moral idea than this, with its equal insistence on the obligations of the social state and on the demands of individual liberty, and its curious Greek elevation of the intellectual life—which, however, though free from passionate agitation, has its own pleasurable enthusiasm—into the first place. And then this ideal is based on a thoroughly scientific view of man's nature, and does not depend on any transcendental ideas. For, whatever ideas we may have to attach to such terms as God, *natura naturans*, and so on, in the speculative part, there is no doubt that in the practical part, what Spinoza means by the intellectual love of God is, as Mr. Pollock shows, hardly distinguishable from that modern "Cosmic emotion" which is said to be inspired by a view of the order of the world as a whole. Mr. Pollock appears to think that this emotion is destined to take the place of the older religious sentiment with modern minds. This point we cannot discuss here. Yet it may be well to remark that the conditions of our busy modern life probably leave less room for any such habitual quietism as Spinoza preaches, and which his state of tranquil isolation so highly favoured. To this it may be added that quietism can hardly be demonstrated on strictly natural grounds. Spinoza's argument that to know the cause of a misery is to become indifferent to it is certainly open to criticism; for the example given (p. 284) goes to show, not that we bear what we understand, but that we bear what we got used to.

Too much praise can hardly be given to Mr. Pollock for the thoroughness with which he has carried out his difficult work. The critical sifting of authorities, the painstaking in getting at Spinoza's meaning, including the careful illustration of the system by the correspondence, the method of setting forth Spinoza's doctrine, first by a brief statement in the expounder's own words, followed by a fuller detailed statement in which Spinoza is made to speak for himself in idiomatic English, the combination of admiring appreciation with independence of judgment, all this is highly meritorious. If there is anything to complain of here, it is the omission of illustration by historical allusion, as, for example, the pointing out of the direct relation of what Spinoza says about the emotion of wonder to the curious account of this emotion contained in the *Passions* of Descartes. We may add that Mr. Pollock throughout shows the results of a culture at once wide and deep. His scientific knowledge, and more especially perhaps his acquaintance with certain tendencies in modern psychology, everywhere stands him in good stead; and sometimes, as in a remarkable passage on determinism (p. 203), he gives us some very pregnant independent hints on the best solution of the questions touched on. In addition to this he shows the advantages of a legally trained mind, both generally in the judicial attitude which he takes up with respect to controverted points, and specially in

weighing matters of evidence. And this training bears yet more palpable fruit when the writer is dealing with Spinoza's ethical and political conceptions. Last, and not least, Mr. Pollock writes in a clear and forcible style, which can on occasion be unstinting and generous in its eloquence.

ERRANT.*

IN his new novel Mr. Percy Greg has come down from the zodiac, and has confined himself to the ways and circumstances of middle earth. We do not think that he has lost thereby. Whatever may once have been the case, an eccentric setting is rather against than in favour of the currency of a story nowadays. But, in descending from the neighbourhood of the Scorpion and the Sagittary, Mr. Greg has by no means abandoned his fancy for discharging arrows and directing stings at the weak points of his fellow-mortals. We happen to be among the mortals whom these stings and arrows do not gall, and therefore we can read *Errant* with equanimity, and occasionally with much satisfaction. But it is probable that a considerable number of readers will resort to that manœuvre which Mr. Thomas Hughes once deprecated in his own case, and "pitch the book to the other end of the room." Mr. Percy Greg would, we have no doubt, contemplate this proceeding with feelings rather of pleasure than of annoyance, so there is no harm done by the indication of its exceeding probability.

Errant differs from the majority of novels in one important point. Its beginning is very much its weakest point. And it is not until the book is half over that it thoroughly interests, and, so to speak, enlists the reader. There have been authors who ostentatiously wrote novels without a hero; Mr. Greg's novel consists of a hero and hardly anything else. All the other characters are merely foils or adjuncts to Lionel Darcy, Marquis d'Ultramar, a gentleman who combines the bluest of English with the bluest of French blood, and who bears, except that his biographer can write English and does not misquote either the French or the Latin or the Greek language, a rather parlous semblance to the heroes of the late George Lawrence and the living Ouida. We say that Mr. Greg can write English, and he undoubtedly can. But there is one irritating solecism which he perpetually puts in the mouths of his choicest characters, and which we heartily wish away. This is the use of the plural contraction "don't" for the singular contraction "doesn't." There was once, we believe, a vague notion, founded on little warranty of Scripture or conversation, that persons of otherwise irreproachable speech indulged in this hideously ugly fault. But as for the last thirty years—and Mr. Greg's story is entirely comprised in the last five-and-twenty—no one above the rank of a grocer has attempted it. We really don't know why Mr. Greg should sully the lips of his descendant of a hundred marquises therewith. This, however, is by the way. Lionel Darcy, to return to our story, is introduced to us on the eve of the Indian Mutiny at a station in India. He is only just a man as years go, but his general conduct is that of a seasoned *preux* of five-and-thirty. If he does not turn up the lip, curl the nose, and flash the eye quite so much as his brethren of the clans of Livingstone and Chandos, he makes up for it by the most outrageous *outrecuidance* of speech and behaviour, and by deeds which are worthy of Amadis or Almansor. He chooses to patronize (quite harmlessly) a Eurasian girl named Zela Manton, and this patronage exposes him to several unpleasant remarks from his seniors, to which he replies with something more than controlment for controlment. At this time he is introduced to a travelling American, a Southerner, who has with him two pretty, but very young, daughters. The Mutiny, which of course Darcy has fully foreseen, breaks out, and he distinguishes himself brilliantly, enlists a wavering native prince in the service of the English, helps him to defend his fastness against the mutineers, rescues many English ladies, and is finally invalided home with an immense fame, a certainty of the Victoria Cross, and other good things, besides the tolerably evident love of one of those whom he has rescued, Helen Kavanagh, who nurses him on the way back. On arriving in England he finds his father dead, and the severity of his wounds seems to deprive him of much chance of success in his profession. But he is as all-accomplished as the wise man of old, though by no means of a stoical turn. A journalist whom he has known in India is editor of a London newspaper, and Darcy, youthful as he is, is soon engaged in writing political articles of the usual effective kind. Friends and enemies of his family, too, begin to interest themselves in him, and his career, either military or civil, seems to be assured. At the very time, however, when all seems to go well, Zela Manton appears upon the scene, and everything goes wrong. It is in vain that Darcy is restored to health, and that his sister marries a nobleman of influence and of a romantic history, the uncle of Helen Kavanagh, whose inclination for Darcy is not hidden. Zela, suddenly deprived of her mother (an Indian Ranee, who dies chagrined at the failure of a suit she has against the Government), flings herself on Darcy's protection, with the alternative only of suicide, which she actually tries. His family pride forbids marriage, and the renewal of the old scandals leads him after her sudden death to assault an old Indian enemy so ferociously, that a duel with a fatal termination results. His commission is forfeited, and his career closed.

We have analysed the book up to this point, because we think that a good many readers would be well advised if they began in the middle of the second volume. Up to this, there is a good deal of what Thackeray used to call topsy-turvification in Major Lionel Darcy, of Ulswater, Marquis d'Ultramar. As he is represented as a Roman Catholic, it is probable that he had missed the wholesome discipline of a public school, and, as he seems to have entered the army early, he must doubtless also have missed the perhaps still more wholesome discipline of the Universities. He is, in truth, in the first volume and part of the second, a very ill-conditioned young man, childishly intoxicated with family pride, and apparently unaware that English gentlemen do not, as a rule, ram their crests and pedigrees down the throats of their associates, or behave as if they themselves had those crests and pedigrees packed into their own backbones. There are passages in the life of Lionel Marquis d'Ultramar at which the firmest believer in blue blood and the staunchest of Tories must feel inclined to ejaculate, with my Lord Egham, "Oh, come, I say, sink the heraldry!" But when the Marquis, or Major Darcy (whichever the reader prefers), has killed his man, and has come into a large fortune, and, though unable to revisit England, has all the world free to him save these islands, then Mr. Percy Greg warms to his work. Lionel finds his way to Louisiana, and from the point where he does so we shall leave the reader to follow his fortunes for himself. They are worth following. Mr. Percy Greg, like the enormous majority of English gentlemen fifteen years ago, was apparently a strong partisan of the Confederacy, and, unlike some at least of those who answer to that designation, he has not changed his creed in deference to the insolent game of fortune. Darcy reaches his future home in time to rescue his old acquaintances in India, the Miss Duponts, from the horrible fate which, as a possibility, was the great reproach capable of being brought against the old *régime* of the Southern States; and soon afterwards the war breaks out, and he enters heart and soul into the Confederate service. The battle-scenes of the first volume (which is occupied with the Indian Mutiny) do not lack vigour; but those in the third, where the Secession War is dealt with, are beyond doubt among the most vigorous and stirring things of the kind which have found a place in prose fiction for some years. Sympathizers with the North may possibly read them with a wry face; but even they should allow that a man must take a side, and that, if he takes it, he may as well take it heartily. We shall, moreover, go so far as to say that no one who is acquainted with the actual facts of the war can honestly attempt to charge Mr. Greg with exaggerating the deeds of the Northern troops under Generals Sherman, Butler, and others. It was interesting the other day to see that there was a plan of bringing over the conqueror of New Orleans to defend Mr. Parnell and his friends. Difficulties as to *locus standi* are believed to have deterred Mr. Attorney-General Butler, and perhaps, too, there may have been other difficulties. But, since it has been proposed to import into Her Majesty's dominions persons of this kind, we can only regard Mr. Greg's book as exceedingly timely.

This timeliness, however, is only an accident, and *Errant* must repose its claims on its actual pathos and its actual vigour. In neither of these, we think, especially if the reader's attention be, as we have recommended, concentrated on the last half or two-thirds of the book, is it likely to be found wanting. Although, as we have said, the subsidiary characters are purposely subordinated to the overshadowing figure of the hero, there are several which, if Mr. Greg had taken a little more pains with them, would have come out very well. Of exciting incident, moreover, even beyond the limits of the two great struggles with which the plot is chiefly busied, there is enough and to spare. But there is no doubt that the author has wished to concentrate himself on the drawing of a knightly character, wrecked in consequence of his obstinate and intemperate clinging to his own ideals, and of the incompatibility of modern circumstances with his temperament and character. We have said that at first the presentment is only very partially successful. Darcy, when we first make his acquaintance, is rather, as far as age and position goes, a page than a knight, and, despite his remarkable pistol practice with a tiger in the first twenty or thirty pages, one feels that his chief characteristic is, on the whole, what is called in modern days "cheek." He should have been younger, so that more excuse might have been made for him, or older, so that there might have been less need for excuse in order to secure that sympathy which is so necessary for a hero. As it is, it is not till he bids his ten thousand dollars for Florence Dupont that the reader consents to regard him as other than a valiant cub. Thenceforward, though his conduct will be terribly shocking to the Peace Society and the Aborigines Protection Society, and a great many other Societies besides, one really does not see what else he could have done than that which he actually did, considering the network of difficulty which his good deeds and his bad together had woven around him. Of the bad deeds, though perhaps the adjective is on the whole harsh, his action in regard to Zela Manton is certainly the worst, and it is also the worst thing about Mr. Greg's book from the point of view of art. Darcy's conduct, combined with his motives, is not by any means impossible in itself, but Mr. Greg has not altogether made its possibility, let alone its probability, as clear from the account he gives of it as a novelist should do. In this, and in the obstinate bloodthirstiness of the quarrel which he fixes upon his victim, Colonel Thomson, are to be found the ethical reasons of the hero's melancholy end, for it is no revealing of secrets to say that it is melancholy. Upon these

* *Errant*. By Percy Greg. 3 vols. London: Sampson Low & Co. 1880.

two things, therefore, the novelist was bound to expend his skill to make them as natural and as excusable as possible. Mr. Greg has not quite succeeded in doing this, and here, as well as in his Lawrencisms and Ouidaisms already mentioned, lies the weakness of his book. It is, however, by no means alone in such weaknesses, while it has but few companions in the peculiar strength and blood-stirringness of the battle scenes of which it is full.

TO CABUL WITH THE CAVALRY BRIGADE.*

If amateur authors like Major Mitford did not enter the fields of literature by choice, they would have a strong personal grievance against Special Correspondents. It must be difficult for them to set down their feet on ground that has not been repeatedly covered by the tracks of writers whose business is observation; and, unless they have an exceptional talent for effective narrative, their descriptions are sure to be eclipsed in point of picturesqueness. Of course, sooner or later, the historians must follow the Correspondents, when a comparison of the various hasty sketches by the latter will furnish the materials to be utilized by the former. But in the meantime, the reading public has had its curiosity gratified, and perhaps satiated. Events tread fast upon events, and one excitement is rapidly effaced by another. From an army standing on its defence behind the entrenchments of Sherpur people's eyes are turned upon squadrons at their moorings in the Adriatic; and Afghanistan is forgotten for South Africa, or for the still nearer and more thrilling sensations of Ireland. So writers like Major Mitford are apt to slip down between two stools, and can hardly hope for any great popularity. Not that Major Mitford has pitched his hopes very high, judging by the modesty of his brief preface. His book professes to be nothing more than a sketch of personal experiences. He disclaims all intention of being technically critical, confining himself merely to accurate reporting. And, although naturally desirous that his volume may be made generally welcome, he addresses it chiefly as a memorial of the campaign to his commander and his brother officers. So far we may give it honest praise. It is the straightforward story of a spirited soldier, who saw a good deal of exciting service. As a cavalry officer, frequently detached with small parties of horse upon special duties, Major Mitford experienced a greater variety of personal incidents than would have fallen to the lot of his brethren of the line; and some circumstances came under his personal observation which, so far as we know, have hitherto escaped notice. His few illustrations are excellent, and give a vivid idea of the general character of the country, while every here and there he depicts some scene, such as the bazaars of Cabul or the fruit markets of the city, so as to show that he can use the pen to as good purpose as the pencil.

In the summer of 1879, after the massacre of Cavagnari and his companions, the 14th Bengal Lancers received their orders for Afghanistan. For three months the regiment, being quartered at Koorum, had been suffering from heat, malaria, and ennui. The change to active service was eagerly welcomed, and it was a good sign of the *morale* of the men that invalids entreated to be passed by the doctor. The doctor declined to be lenient; and, as the event proved, he acted wisely. The duties imposed on the men were severe; and they had to face the winter temperature of the Afghan highlands with insufficient clothing and a meagre commissariat. The horses that carried them on incessant scouting service were often underfed; and, thanks apparently to the influence of routine on the authorities, attention to the most ordinary comforts was often almost wantonly neglected. There was a striking example of this when they were ordered to keep under arms through the night when an attack on the entrenchments of Sherpur was expected. There was forage in comparative abundance within the lines; and had trusses of straw been given out for the men to spread upon the snow, they would have been just as palatable for their horses afterwards. The gentlemen of the commissariat department seem to have thought differently. Men recruited from the hot provinces of Lower Bengal bivouacked as best as they could on the frozen ground and *à la belle étoile*. To begin with, their start from the Koorum cantonments was made in the very lightest marching order. This no doubt was indispensable, considering the exigencies of the case; and it certainly seems a satisfactory contrast to the old-fashioned manner of campaigning, when each regiment on the march, whether of infantry or cavalry, was encumbered by an interminable train of baggage animals and swamped in the mixed multitude of its camp followers. The kit of each officer was strictly limited to 160 lbs.; and the half of that was taken up by his tiny double-roofed tent; while the other half comprised his personal luggage. To each camp follower twenty-five pounds was allotted, and as much to each charger. Naturally these unfortunate followers, between impecuniosity, parsimony, and improvidence, neglected to make the most simple arrangements for their own comfort; and of course they suffered accordingly when winter caught them in all its severity on the exposed *plateaux* of Cabul. Major Mitford afterwards mentions casually how he purchased ample supplies of warm over-clothing for his personal attendants, which spared them the diseases that proved so deadly to others. But Major Mitford was a kind master and a man of means; and at that time he happened to be within easy reach of the extortionate merchants in the bazaars of the capital. The men of the 14th had stripped for active service. They cast their gay uniforms of blue, scarlet, and gold, replacing them with unsightly and coloured casings; while the jackboots were exchanged for more useful highlows, and the lower limbs were swathed in bandages of woollen. The troopers had orders to march out on foot; and the horses were loaded with canvas bags, containing five days' forage and provender. Considering that the men had been born and bred for the most part on the plains of Hindostan, the climbing the sides of the Kotul was rough and trying work. Major Mitford's sketches give an impressive idea of the forbidding and formidable aspect of the mountains. When we remember the inaccessibility of these natural fastnesses, which must often have neutralized our superiority in cavalry and guns, officers and men seem to deserve the greatest credit for the results of a desultory and irregular warfare. The Afghans speedily learned to make the most of these natural advantages. Major Mitford repeatedly describes how the masses of wild mountaineers would scatter from their already broken formation when they came within range of our artillery. Nevertheless they would still press forward, though in excessively loose and open order, taking advantage of each rock and stone that offered a chance of cover. Each village, also, was more or less of a fortress. The villages were enclosed in high walls of tenacious clay, and secured by formidable gates, which were duly barred and bolted. Then the mud walls that bordered the roads and bridle-tracks offered continual opportunities for ambushes, which not unfrequently proved fatal to one party or the other. Major Mitford relates one *ruse de guerre* where he took an opportunity of turning the tables on a skulking enemy. Riding as usual at the head of the squadron in a narrow lane, an Afghan popped up over a wall and took a shot at him point-blank. Happily the bullet miscarried, and the *franc tireur* dropped down again like a Jack-in-the-box. Major Mitford, guessing his tactics, ordered the troop to ride ahead; while, drawing back himself, he quietly waited. The Afghan, hearing the receding troop, rose again to enfilade the rear of the detachment; when a shot at short range from the Major's revolver anticipated his friendly intention.

After the treachery that had brought our embassy to its untimely end, and dealing as we had to do with a nation that never practised the chivalrous refinements of warfare, retribution of course was often summary. Some of the most exciting of the incidents in Major Mitford's volume relate the arrest or execution of spies or guerillas who had sought to play their captors false, and suffered accordingly. Among other events of the kind, Major Mitford, when in the company of General Roberts, chanced to witness the execution of the Kotul, or chief magistrate of Cabul, condemned for his complicity in the murder of Cavagnari. The Kotul, whatever his guilt, met his fate like a man, and died with the dignified stoicism of a genuine Mussulman. He had dressed for the closing scene in a garb of green, as became one who may have claimed descent from the Prophet. He moved forward to the scaffold with a firm step, calmly testing the strength of the drop before setting his foot upon it; and, finally resigning himself to the indignity of being pinioned, died without a sign of flinching. There was a hot chase, too, after several of the "generals" who had commanded the Herat regiments and the Cabul populace in that unhappy *émeute*. Major Mitford had the good fortune to capture one of them, under rather peculiar circumstances. He was guided by a Kizil Bash who had returned to his old loyalty to the English after taking service with the Afghans. The general they had gone in search of was believed to be in hiding in one of several villages. Major Mitford had searched a village in vain, paying special attention to the dwelling of the head-man. It occurred to him that the fugitive must still be there; and that, if he were there, he had probably taken refuge in the last sanctuary of the zenana. Giving the ladies warning to veil themselves, he insisted on having admission. And the General was dragged from his hiding-place accordingly, to be brought in due course before the military tribunals, where execution followed summarily on conviction. In one case he was baffled, and had the joke against him, when in pursuit of the Löinâb, or "Chief Commissioner" of Kokistan. That functionary was reported to have gone away towards the north-east, carrying with him an immense amount of valuable loot and a considerable quantity of specie. Following up the chase, Major Mitford nearly ran into the runaway at a certain village. All the able-bodied men and women had been pressed as carriers of luggage, and they had left nobody behind except a few rather intelligent children. The fugitive had so unsatisfactory a start that it was idle to carry the pursuit further. Major Mitford had to console himself with the discovery of a large quantity of valuable plunder that had been left behind, and accordingly he despatched messengers to Cabul for the requisite baggage animals. What excited him the most was one ponderous case firmly shut down by screw nails. He hardly doubted that it contained the coveted specie. But when the case was opened on the following day in the English camp in the centre of a circle of excited spectators, the contents proved to be only a mirror, and a very indifferent one. We should have fancied that Major Mitford might have been sooner undeceived by the difference in weight between plate-

* *To Caubul with the Cavalry Brigade: a Narrative of Personal Experiences with the Force under General Sir F. S. Roberts, G.C.B.* By Major R. C. W. Mitford, 14th Bengal Lancers. London: Allen & Co. 1881.

glass and bullion. But in any case, the story is a good one, and the volume abounds in lively writing of the kind. As a familiar tale freshly told, with additions and revisions, *To Caubul with the Cavalry Brigade* is quite worth reading.

HEROES OF HISTORY AND LEGEND.*

WE are told in the preface to this volume that the translation has been undertaken at the request of the Chairman of the British and Foreign Blind Association, "in order to provide in a popular form a brief outline of European history, to be embossed for the use of the blind"; and that it is also published in ordinary type "to bring the book within the reach of a wider circle of readers." In judging of a work thus designed for two classes of readers the claims of the blind must surely be first taken into account. The responsibility of those who provide information on any subject is increased in proportion to the pupil's power or lack of power to test the statements put before him. The historian who has to write a narrative without notes or references is bound to be doubly careful, not merely as to the exactness of his story, but as to the clearness with which he states the amount and the quality of the evidence adducible for it. He must be even more thoroughly on his guard if he is writing for those whom a terrible affliction has left comparatively helpless for the task of sifting or scrutinizing the materials brought before them. If this volume had been translated simply for those who can see, we should have had no difficulty in speaking of its merits or its shortcomings; but when the literature specially prepared for the blind is so scanty, it becomes our duty to see whether and how far it is likely to answer its purpose, which can only be that of imparting sound knowledge, and withholding from them anything which they would have to unlearn. We are not told that Dr. Grube wrote his book for the special benefit of the blind; nor have we any right to conclude that he designed it as an outline of European history. If he did so design it, he has failed. It is not an outline of European history, even if we confine the narrative to what is called modern history. If we are to have an account of the origin of Christian monachism, it is not easy to see why we should dwell on the lives of Egyptian ascetics to the exclusion of those who laid its foundation in the West; or why, in a chapter on religious movements in the seventh, eighth, and ninth centuries, the greater part of the space should be given to the rise and growth of Islam. We can scarcely be said to have an outline of English history when we have three or four pages about Alfred the Great, one or two about Edmund Ironside and Cnut, and one or two more about William the Conqueror, while of subsequent ages we are told nothing.

But the materials of the volume are not all of one kind; and it is on this point that a book prepared for the blind must be most rigidly tested. It may perhaps be urged that the twofold character of its contents is sufficiently indicated by the title, which professes to treat of heroes of history and legend. But, even in the case of those who can use their eyes and are so far able to compare the statements of one book with the statements of another, we should have to ask what help is given them in the task of distinguishing between the two kinds of matter. We have seemingly some which is historical and some which is not historical; but, if the two are often thrust or huddled together in a single chapter or a single page, how is the reader to know when he passes from one to the other? The life of Woden or Odin immediately precedes that of Arminius, the destroyer of the legends of Varus. To the latter a date is given; for the former there is, we were going to say, none; but we remembered that there are histories, not very ancient even now, which set down the precise year in which Jupiter entered on active life in Crete. In another chapter Siegfried and Roland, Pope Urban II. and Godfrey of Bouillon, the lion-hearted Richard and Philip Augustus, are brought on the stage together. If there is nothing to show that our information about Siegfried is wholly different in kind from that which we have for the age of the Council of Clermont, it is hard enough on the average of readers who can see; it is most unjust for the blind.

But the preface further tells us that the original text has not always been adhered to. Changes have been made in some instances "where names, dates, or facts were obviously inaccurate." The translated volume claims, therefore, to speak with more authority than the German of Dr. Grube. We can but put it to the proof; and we may take certain points which none will wish to banish to the region of legend, whatever meaning we may assign to this last rather ambiguous word. If it is necessary for the reader to know anything about our tithings and hundreds, our shires and counties, it is surely of the first importance that he should know the order of their growth. In the present volume their origin is accounted for in the following fashion:—Alfred the Great was most anxious, it seems, to put down robbery and violence of every kind; this result he felt that he could bring about only by "making the English themselves responsible"; and he could make them responsible only by a systematic subdivision of the country. Accordingly, "he divided England into shires, the shire into hundreds, and the hundred again into tithings." If this means anything, it means that the original unit was the shire, that the tithing was a secondary notion, and therefore that the idea of the families, into which the tithing was divided, came last of all. If the real growth was precisely the reverse of this, then this version of Dr. Grube's work can scarcely be a book which may be placed with advantage in the hands of the blind. If any changes were to be made in the author's text, it is unfortunate that the reader could not be told here that the shire must not be looked on as a division of the kingdom, or the mark as a division of the shire, and that all the shires of England could not have been formed or named by Alfred, for the simple reason that they were in existence before he was born. With the same lofty disregard of accuracy the reader is assured that "as the battle of Xeres gave all Spain to the Arabs, so the single battle of Hastings subjected all England to the Normans." It is unfortunate that historians tell a very different tale.

It matters little to what part of the volume we turn. We may take the chapter which treats of Mahomet and the faith preached by the apostle of the sword. This, to be sure, is not immediately a portion of the history of Europe; but, if anything is to be said about it, the reader should most carefully be warned that, along with genuine historical evidence, and with testimony much of which is indubitably contemporary, there has sprung up a mass of tradition, none of which can be taken on its own authority. But in this chapter the story which makes Gabriel take the heart of Mahomet from his body and wipe away the black drops of original sin, and the more elaborate tale which describes the journey on Al Borak to Jerusalem and the ascent of the prophet on the golden staircase to the heaven of heavens, are given as proceeding in their present form from Mahomet himself. Not a hint is given that neither narrative has any countenance from the Koran, beyond a phrase or a single sentence; still less are we told that the fiction of the physical cleansing of the heart exhibits a miracle in the very process of manufacture, from the simple confession of Mahomet that while he was still in the gall of bitterness and bond of iniquity God had touched his heart. It would be well that the blind reader were made aware that the night journey and the ascent to heaven, the description of which here fills more than a page, may be referred to in the verse of the Sura, which praises God for carrying His servant by night from the Sacred Temple to the further Temple that He might show him some of His signs, but is certainly not referred to anywhere in the Koran. The passage which pronounces judgment on the teaching of Mahomet and its results is not more happy. We are told, indeed, that "this religion appears as the handmaid of sensuality"; that "it represses the spirit of freedom and encourages superstition"; but the conclusion of the matter is that "it has reclaimed the heathen nations, whom it has converted from rude idolatry to the worship of One God; it has diffused reverence for the Creator, obedience to the Ruler, and trust in the Judge of the world, and enjoined many of the virtues which adorn and sanctify life. Justly, therefore, with all the faults inherent in it, may it be regarded as a beneficent dispensation for uncivilized races." We have nothing here which is positively untrue; yet the general impression left on the mind can scarcely fail to be inadequate and misleading. It would be, indeed, impossible for the reader to gather from this volume that the system of Islam has for the most part been forced upon nations and peoples which were not uncivilized at all; that in many cases it has destroyed higher and better systems, and left an intellectual waste or wilderness where it found a well-cultivated garden; and that this fact alone must determine the balance in which the system is weighed. Still more important is the point that it has deliberately sanctioned evils which are acknowledged to be evils, in order to check evils supposed to be yet more deadly. By reforming these partially it has perpetuated them, and has furnished for polygamy, slavery, and despotism a justification of which they can be deprived only by the destruction of the religion itself. The reader is told that the fundamental principle of the religion is that there is one God only, and that Mahomet is his prophet; but he is not told that the revelation which imparted this truth deprived those who refused to accept it of all title to life, and therefore also of all claim to justice, the believer having of course a clear right to treat as he pleases the man whom he might or ought to have slain, and who lives only by his sufferance and mercy.

We have the same fault to find with the chapter on the Hohenstaufen dynasty. Indeed, unless the fact stated be true, a special injustice is done not merely to the reader, but to the great ruler of whom the author speaks, when he tells us that Frederick I., the Redbeard, burnt Arnold of Brescia simply "to please the Pope" (p. 221). If we can believe that Frederick took part in a deed which he knew to be iniquitous merely because he was asked to do so, we place him amongst the worst both of sovereigns and of men; but it is as easy to give the true facts in a history which must be short as in a longer one. Not many words are needed to tell the reader that the teaching of Arnold swept away the whole feudal system, both imperial and pontifical; and that, if he spoke of the temporal sovereign as the sole fountain of honour, power, and wealth, yet this sovereign was with him a popular assembly, and therefore, as Dean Milman puts it, "the alliance of the imperial and pontifical power, which in the end was so fatal to Arnold, was grounded on no idle fear or wanton tyranny, but was an alliance to crush a common enemy." Frederick thus burnt Arnold quite as much to please, or rather to protect, himself as to please or protect the Pope.

Nor is Dr. Grube less wide of the mark when speaking of the oath extorted by the Norman duke William from Harold over the

* *Heroes of History and Legend.* By A. W. Grube. Translated from the German by John Lancelot Shadwell. London: Griffith & Farran. 1880.

chest of relics. He says that, although Harold took the oath, "he did not think himself bound to keep it. His ambition revolted against it; perhaps, also, his patriotism, to which it might seem intolerable that England should fall under foreign domination." Two things are implied in these words—the one being that Harold made the promise with the full intention at the time of breaking it; the other, that Harold was the only person to be consulted in the matter. In full agreement with this implied notion, Dr. Grube goes on to say that, on the Confessor's death, "Harold, with the approval of the English people, immediately ascended the throne." Here, again, the assertion is that the act was that of Harold alone, that he had an inherent right to the throne, and that he asked from the people nothing more than an acknowledgment of that right. It is scarcely necessary to say that the picture is deceptive from beginning to end. No oath of Harold, or of any one else, could bind the English people in things which affected their freedom; Harold had no right to the throne until he was elected by the people, and he never pretended that he had any. The nation had a right to choose whom they would, and they chose Harold. Harold might perhaps have refused to obey their call, but he could scarcely have done so as a good citizen or patriot; and if he obeyed it, he had nothing to do with any promises which the nation had not sanctioned, far less with promises which were forced from him by a constraint equal to that which the armed highwayman exercises on a defenceless victim.

The tenth chapter of the book treats of "the Austrian Emperors," and these, we suppose, are to be regarded as heroes of history rather than of legend. But the story of the life of Albert I. has been mingled by the tradition of a later age with the story of Gessler and Tell. There would, of course, be no harm in introducing this story as a tale which has been thrust into a narrative with which it has nothing whatever to do; but, instead of doing this, Dr. Grube tells his readers that "Gessler determined to test the feelings of those who were most disaffected towards his government and the House of Austria." Then follow the incidents of the cap stuck on the pole, and of Tell's refusal to do obeisance to it, and of the famous ordeal in which he showed his power as an unerring marksman. "With God's help," Dr. Grube adds, "Tell resigned himself to the arduous task, and succeeded in hitting the apple without harming his little son's head." Having given the sequel of the marvellous narrative, he goes on to speak of the battle of Morgarten. All this is utterly misleading. It is, indeed, just possible that a reader closely scrutinizing these pages might see in some of Dr. Grube's remarks grounds for doubting the truth of this wonderful story. He might think it strange that the confederates at Rutli, while they declared that "they would manfully defend their freedom," should declare also "that they would not molest the people or the territories of the house of Hapsburg." The Tell story would not only make such a declaration incomprehensible; it would have furnished to the Emperor a constraining motive for putting down what to him would have been the insolent rebellion of a rude peasantry. It would be no more difficult to give, as Rilliet gives in his work on the origin of the Swiss Confederacy, the true narrative of the time, than to exhibit in its proper light the cause which brought about the death of the Brescian Arnold.

We have taken a few only of many passages on which, if we spoke of them at all, we should be compelled to make similar remarks; but we have perhaps said enough to show that for blind readers this volume is but a questionable boon. This is the more to be regretted as Dr. Grube writes vigorously, and many of the pictures which he draws are vivid and effective. But in such a work as this the duty of distinguishing fact from fiction is paramount; and we cannot say that the author and the translator have adequately discharged it.

HARTLEIGH TOWERS.*

THE short stories of which the names are given on Mrs. Milne Rae's title-page, with another of more recent date which we had lately occasion to notice, have appeared anonymously, their authorship being now for the first time acknowledged under the shelter of what lawyers describe as "coverture." *Hartleigh Towers* is an experiment on a larger scale, and, as the first attempt of its author to occupy the position of the novelist, is entitled to consideration from the writer's, and not merely from the critic's point of view. It may be necessary to point out some defects of workmanship which practice and experience will perhaps remedy; but the motive and aim which are evident throughout this story will go far to compensate for any artistic shortcomings which may be apparent in it. The customary transition from the child's story-book to the "library" novel is very much of the same nature as the corresponding step in poetical literature described in the early years of the present century:—

> With thee our nursery damsels shed their tears
> Ere Miss, as yet, completes her infant years;
> But in her teens thy whining powers are vain—
> She quits poor Bowles for Little's purer strain.

We make the quotation from *English Bards* without change, though "whining" may perhaps be an epithet little deserved by the child's story-book of the present day, while not a few of the modern novels which are offered to our "choir of virgins" in the morning room or on the seashore might have startled even the "young Catullus" of the days before the Regency. But even where the novelist's art has strictly limited itself within the bounds of purity, it may yet produce a result which is, or is reasonably considered to be, unsuitable for young girls; and the problem of creating a fiction which shall be sufficiently interesting without being unduly exciting is one which in many domestic circles is regarded as well worth the trouble of solving. The attempt at its solution is analogous in literature to the coffee-tavern movement, in relation to other kinds of "entertainment;" and such an experiment has been made by the author of *Hartleigh Towers*, whose work in its present form is meant to reach a class of readers who are not likely either to take in, or to take up, the successive numbers of a magazine.

The framework of *Hartleigh Towers* is so simple that the story can hardly be described as having any plot whatever. Such plot as was requisite to account for the only and very transparent mystery which exists involves the assumption by the reader of a series of impossibilities; not the least remarkable of which is that the daughter of a gambler, brought up with the understanding that her face was her fortune and her future dependent on her marriage, should know so little of the world and of the law as to suppose that any agreement for separation from a mad husband could deprive her of her name and rights as a married woman. Her son, Hugh Hartleigh, the hero of the book, enters into possession of his father's estates as a matter of course; while such a succession could only in actual life have accrued through one of the methods known to the law, all of which are barred by the hypothesis presented to the reader. If he succeeded under a marriage settlement or an intestacy, his descent must have been formally established, and he must have known his mother's name; while his individual succession as legatee under a will is rendered impossible by the insanity of the elder Hartleigh. But the author has plainly overlooked the preliminary conditions of the situation which she proposed to create, and in which the mother, working for the benefit of her son's forsaken tenants, was to remain unrecognized by the son, who believed her to have died shortly after his birth. The incidents of the story gather round a neglected mining population which had grown up on the property of an absentee landowner. No one had been found to care for the miners, either in body or soul, except the village doctor, with whose sudden death the scene opens, and whose daughter takes the position of principal heroine among the characters of the novel. But the author has avoided the commonplace device of making the conversion of the hero from his misguided ways due to the influence of love and the heroine, and has been careful instead to trace it to the work and counsel of his unknown mother, and to the example and labours of Dr. Carew, surviving in the character of the miners themselves, or at least of some of them. The main course of the story is connected only in the most incidental way with the subsidiary action, which appears to be introduced chiefly for the purpose of giving the author opportunity for character-drawing, in a series of more or less independent pictures. Like many other lady writers, she has succeeded admirably in her sketches of women, while many of her men are either dummies or failures. Men do not talk as women make them talk in books; and Hoskin's Club is as evidently unreal as the pictures of Mrs. Carew, Louisa Morgan, and that young lady's mother, who sits complacent in a green dress on a blue chair with pink ribbons in her cap, and who talks accordingly, are the reverse. But the best of Mrs. Rae's sketches of character is that of the faithful old Scotchwoman, a family servant who watches over the second heroine in the grim London square where dwells an old miser something, but only something, of the type of Arthur Gride. This old man, Josiah Morgan, is the most lifelike of the male characters outside the principal stream of the story; Caleb Bartlett, the miner, on his own side being nearly as good as Betty Skinner the Scotchwoman. But the real Josiah Morgan would have lent his gold instead of hoarding it; he would have robbed Muriel of her five sovereigns as he did, and cheated the doctor, but he would have turned the contents of his black cabinet into fructifying paper after the manner of his kind. In the future work which we shall hope to see from this author's pen, she will do well, after forming her idea of scenery or character, to test its congruity with the circumstances with which she surrounds it. Even in such minor details as the names of places this point deserves attention. "An old fashioned, ivy-clad house" may have been "known to the inhabitants of St. Oswald's as Mulberry Park, having taken its name from some fine old trees which still flourished on the lawn," although we should more naturally connect such an address with a villa in the suburbs of Birmingham, or with an imposing mansion erected by some prosperous and self-made manufacturer, whose next neighbour had forestalled him in the more impressive designation of "Court," in happy ignorance of, or contempt for, the manorial rights implied by that name. Still, "Mulberry Park" may pass, on the principle laid down by Mr. Squeers; but "Greenwood Gate," as the ancient name of a street or road giving entrance to an historical city or borough, is entirely inadmissible. "Mrs. Carew's new abode at Greenwood Gate was not situated, as its name might imply, on the borders of a leafy forest. All traces of the gate, as well as of the forest, had been long since swept away." Without touching on the disputed question whether "gate" is equivalent to "*porta*," as seems to be the case in London, or to "*via*," as is certainly the case in the North, we must object to the "Greenwood" under all

* *Hartleigh Towers: a Story of English Life.* By Mrs. Milne Rae, Author of "Morag," "Geordie's Tryst," "Andrew Gray's Story," &c. 3 vols. London: W. Isbister. 1880.

circumstances. It is true, no doubt, that "'tis merry in good green wood, when the mavis and merle are singing"; but it by no means follows that the "canonized founder" of St. Oswald's or any of his unbeatified contemporaries would have used the term as equivalent to "forest." The "green wood," which is more correctly written in two words, is the wood in its early summer foliage, and is not used as a term for the forest generally, which it does not describe either in its autumnal hues or in its winter nakedness.

It is, however, in the author's conception of the "mines," in which the chief interest of *Hartleigh Towers* centres, that this want of care for circumstances is most singularly observable. They are mines in the abstract, or rather they have an independent and dream-like existence, and are entirely self-contained. There is a public-house frequented by the miners, which passes by the unusual name of "The Coal and Iron," and from this, as well as in other ways, it appears that both coal and iron are obtained on the estate. But there is certainly no railway by which the produce of the miners' industry can be conveyed to the outside world. The railway is no nearer than St. Oswald's, twelve miles from Chadsthorpe, and the village is served by the Highflyer coach; while the negative evidence is conclusive against the existence of a canal. The miners, again, are utterly ignored by the original villagers, who apparently refuse even to become their local customers, and who burn "beech-logs" instead. There are no works connected with the mines, so far as the reader can learn, no foreman, no managers, and no trade. The mines themselves were a standing grievance with the original villagers of Chadsthorpe. They occupied "an undulating tract of moorland" which "had been given by a lord of the manor long ago to the villagers as a place where they might unmolested feed their cows and pigs, and disport themselves generally. This privilege had, however, been rather suddenly taken from them during the lifetime of the last Squire Hartleigh." This was the mad Squire, who, after passing the whole of his earlier life abroad, came back, or was brought back with his boy, in middle age to Hartleigh Towers as a convenient asylum, in the charge of one Dr. Rushworth, who combined the offices of keeper, physician, steward, and agent to the Squire in his single person. "One of Dr. Rushworth's first acts was that of wresting the common from the villagers and establishing the mines under cover of the Squire's authority"; "the opening of a mine in the heart of the furzy common" being, it would seem, a process as simple and easy as the digging of a gravel-pit under ordinary conditions. But Dr. Rushworth in time was "obliged to beat rather a hasty retreat from Chadsthorpe, his connexion with the mines having been a very close, and not altogether a creditable, one." He was succeeded, as a temporary arrangement at first, but, as it happened, permanently, by Walter Carew, a student from St. Bartholomew's Hospital; and, by a close comparison of dates, we find that the change took place during the lifetime of the mad Squire. To what extent, however, the newly arrived doctor succeeded to the functions of his predecessor we are not able to ascertain; and Hugh Hartleigh himself, although some years of his boyhood must have been passed at Hartleigh Towers subsequently to Walter Carew's settlement in the village, is represented as having known nothing about him. "'Tis strange!" is the heir's comment, after he has accidentally been present at the doctor's funeral; "he must surely have been a very different man from his predecessor"; and this while Hugh's childish memories, and especially that of his first home-coming with his father and Dr. Rushworth, are described as being sufficiently clear.

It is not in any spirit of unfriendly criticism that we have pointed out these constructive defects in what is, after all, a very attractive story. Mrs. Milne Rae has shown herself to be possessed of considerable descriptive power and of much insight into character. She has succeeded, too, in one or two scenes in which we may confess that we expected her to break down; a fight, for instance, between two bull-dogs in a miners' public-house being a subject manifestly not within her experience, but yet one which she has treated skilfully and with effect. The point of sympathy between the young miner in his affection for his dog and the young landlord in his affection for his horse is worked out with no little care, and the incident of the burial of the dog in the Chadsthorpe wood is very happily conceived. The faults of detail in *Hartleigh Towers* appear to be only such as greater leisure for revision might have enabled the author to remove in preparing for publication in a completed form a work which had originally appeared in parts, and subject therefore to the usual disadvantages of a serial issue.

CHRISTMAS BOOKS.

V.

MRS. FREDERICK LOCKER has succeeded to admiration in identifying herself with what Mr. Herbert Spencer would call the "subjectivity" of a blackbird. She describes in *What the Blackbird Said* (George Routledge and Sons) the emotion of natural and not inexcusable disgust with which a young blackbird wakened to find the world wrapped in snow, the most uncomfortable of the works of nature. The complacent confidence and scientific assurance of an elderly cock robin, who has been told all about "the beautiful crystals" in snow-flakes, make a pleasing foil to the discomfiture of the blackbird. When the robin takes to theology and final causes, when he, like François Villon, "commence à entrer en matière pleine d'érudition et de bon sçavoir," we sympathize with the blackbird's petulance. But Mrs. Locker, we fear, has a veiled didactic intention; and, as Mr. Disraeli was "on the side of the angels," she is of the party of the robin. In spring the detestable robin came out in the line of Mr. Barlow, in *Sandford and Merton*. "'You are surprised at all these changes, my young friends,' he said; 'did I not tell you that the seasons never fail?'" This robin must have been a member of a School Board in Pythagoras's time. We cannot help wishing that a small boy and a catapult would cut short his sermon. But children will probably see the erudite robin with more genial and friendly eyes, and cannot but derive much knowledge from his remarks. Of Mr. Caldecott's capital pictures we prefer the first, the Blackbird in the Snow, which is worthy of Bewick. The sketches of the rook are amusing; the bird has much the air of "Captain Rook" in Thackeray's sketch.

The Boy's King Arthur (Edited for Boys, with an Introduction, by Sidney Lanier. Sampson Low and Co.)—We do not see the necessity for a specially boyish *King Arthur*. Malory's book, in the little cheap reprint called *Prince Arthur*, or in Southey's edition, has always been and always will be a favourite volume, not only with boys of some literary turn, but with boys in general. The charming language of Malory, the constant and bloody battles, the mystic legend of the Grail, the splendid and stately rhetoric of the concluding chapters, make Malory's book the English classic of boyhood. Perhaps a very careful editor might cut out a few pages, not ten in all, which are "touched with the adulterous finger" of the age of Edward IV. Mr. Lanier prints many passages in brackets when he cuts a story short, and the practice is tedious enough. Other italicized words in brackets give the meaning of such rare and difficult terms as "assay" and "purvey." In Sir Ector's speech over the dead body of Launcelot, Mr. Lanier prints "thou wert the goodliest person that ever came among press [*crowd*] of knights." Is this irritating arrangement necessary? We do not remember finding any difficulty in boyhood in the English of Malory. However, even a severely edited edition of Malory's book is better than no copy at all; and for this reason we think that Mr. Lanier's version is infinitely the best of all the Christmas books for boys which have appeared this season. If there be no full and complete edition of the *Morte d'Arthur* available, Mr. Lanier's book will not inadequately supply its place.

The Story of Prince Hildebrand and the Princess Ida (Major T. S. Seccombe. Illustrated by the Author. De La Rue and Co.) Major Seccombe is a minstrel who, with military audacity, makes "four" rhyme to "war." His story—in which a pastrycook's boy, after carrying off the prize at a tournament, proves to be no confectioner, but a prince in disguise—is a sufficiently amusing narrative. That the Prince, armed with a rapier, should have fought a giant armed with an axe demonstrates his possession of truly royal courage and cunning in fence. The pictures are uncommonly spirited. Major Seccombe has also compiled, and illustrated in colours, *Military Misreadings of Shakspere* (Same Publishers). The waggishness of these designs will probably win a smile from officers who have finished the *Field* and have no other literature worthy of their attention on a wet Sunday.

The Cruise of Ulysses and his Men (C. M. Bell. Griffith and Farran).—Perhaps the children who are represented as objecting to the introduction to these well-told stories from Homer were not mistaken critics. Homer's men justify themselves, and so, as a rule, does Homer's morality. Perhaps Christianity has little to do in the *galère* of Odysseus. Mrs. Bell has thought otherwise; but her introduction is very short, and she soon comes to business. Mr. Hannibal Chollop was justly annoyed when some Western archæologist maintained that "the ancient Spartans went ahead of the present Locofoco ticket." We feel the same patriotic resentment when Mrs. Bell says, in speaking of the Phæacian sports, "No light-blue of Cambridge, nor dark-blue of Oxford, ever pulled oars against each other as these young Greeks in the far-off ages ran the race, or aimed the bow, or threw the massive quoit." Mr. Winthrop could probably out-throw the Phæacian sportsmen as easily as did Odysseus, when, in the words of the goddess, "even a blind man might have discerned his token by groping for it, so far it stood beyond all the others." This is enough of fault-finding. Mrs. Bell's stories seem to us to possess much of the merit of Charles Lamb's version of the Adventures of Ulysses. They make a most interesting and desirable gift-book of the best sort, and even very young children may learn from this little work to love Homer and to look forward to the time when they may understand the music of his hexameters. It seems odd that both Mrs. Bell and Charles Lamb translate Διὸς αἰγιόχου as if it meant "goat-nursed Jupiter," or "Jupiter whom they fable to have been nursed by a goat." Have they both preferred the picturesqueness of Chapman to the real sense of the words?

Mr. Moyr Smith calls his *Wooing of the Water Witch* "a Northern oddity" (Chatto and Windus). Odd enough it certainly is, the style being a medley of Mr. Morris's manner, when he translates Sagas, with the slang of the music-hall and the penny comic paper. The smaller engravings are very clever, but the Runic character of the wit is likely to prevent it from being understanded of the people.

Miss Rosina Emmet's *Pretty Peggy, and other Ballads* (Sampson Low and Co.) is illustrated in colours, somewhat in the style of Mr. Caldecott. Poor forlorn Peggy is very pretty, and so is the song of her melancholy adventure. The coarse commonplace

"brother John" of the legend is drawn with a great deal of humour. Another set of drawings illustrate the feelings of an elderly father and a pretty daughter when the time comes for leaving a ball. The other ballads are not so good, and Miss Emmet has still much to learn before she can be a dangerous rival of Mr. Caldecott.

A Six Years' Darling; or, Trix in Town (Ismay Thorn. Illustrated by T. Pym. J. F. Shaw) is a little book about children, which, if the dignity of criticism permitted, we would fain call "jolly." The adventures of infants who have never been in London before, but who explore the Baker Street Bazaar with wonderful intrepidity, become expert in the artillery of squirts, and long for that really fascinating object a pink lamp-shade, are recounted with animated sympathy. The sketches are quite worthy of the stories, and the book is likely to amuse, not only children, but every one who likes children.

Stories of Long Ago (Retold by Ascott Hope. With a Hundred Illustrations by C. O. Murray. Walker).—Mr. Ascott Hope has struck into a new vein of storytelling, which is a welcome variation from his usual wild Indian tales. "The Dog of Montargis" is always one of the most interesting and romantic of quadrupeds, but unluckily he looks of a different breed in Mr. Murray's centre picture from what he does in the other two. We are sorry for Queen Guinevere, who fares so very badly in "Sir Lanval," and prefer to think of her as she appears in the *Idyls of the King*, and not as the sort of person she seems to have been at this period of her history. Children will be terribly puzzled by the story of "Havelock," and will look in vain among the lists of the Queens of England for one named Goldborough, and they are certain to mix her husband up with the hero of the Mutiny. This, however, cannot be helped. The stories, which are gathered from all sources, are very well told, and the illustrations are admirable.

Drifting (T. Buchanan Reed. With Designs by Miss L. B. Humphrey. Sonnenschein).—*Drifting* is a short and not very wise poem about a soul who takes a mental voyage to the Bay of Naples, and gives a sketch of the scenery and produce of the country. The illustrations are mostly pretty enough, but we are at a loss to understand one that refers to Vesuvius. The mountain looks soft and pulpy; and, from a suggestion in the accompanying view about the "volcanic lands," we at first imagined that Vesuvius was supposed still to be in a semi-liquid state. But, as the mainland shows distinct traces of an inhabited city, this supposition must be erroneous.

Our Next-door Neighbour (Stella Austin. Master and Co.) is a capital story of some amusing and mischievous little children and their temporary next-door neighbour, a delicate boy, with whom they make friends. Molly and Sibyl are very talkative, curious young ladies; and, when they have in vain tried to coax their grandmamma to call on the people who have taken the big house next to them, they leave her card themselves, with their names written underneath. Their conversations on points of decorum are always most diverting.

Holiday Times (H. F. Hamilton. Hatchards).—It is refreshing to meet with a book like *Holiday Times*, where the children are natural and well-behaved, but not by any means goody. They have adventures and get into scrapes, like their elders and betters, but they manage to scramble out of them without any harm. The children have a grown-up cousin whom they are all very fond of, whose name of Robert Thomas has been shortened into Bobbie-Tom.

Flora Symbolica; including Floral Poetry, Original and Selected (John Ingram. Warne and Co.)—This is one of those terrible gift-books that every Christmas depress our minds by their tedious efforts after something appropriate to the season. The colouring of the illustrations is coarse and hard, and in some cases, notably that of the maidenhair (p. 36), the pictures are absolutely unrecognizable. The letterpress is about on a par with the illustrations. Not content with lengthy quotations, mostly well-known, from the poets, Mr. Ingram does not spare us long poems written by himself and his family, dragged in by the head and shoulders, as the following remark appended to a paper on the Mezereon (coquetry) implies. "Alas! how many have lived to find that loving means something more than jesting! Ladies fair, take heed in time; as for male coquettes, although they have been heard of in song, let us hope that such despicable creatures as they would be are only the offspring of fiction. How many have been no more fortunate in their wooing when wasting their time on a heartless coquette than the hero of these lines!" What Mr. Ingram's criticism is worth may be judged from his enthusiastic admiration of a poem of Eliza Cook's, two verses of which begin as follows:—

> My own land! my own land, where freedom finds her throne land;

and

> My brave land, my brave land! Oh, may'st thou be my grave land!

Afternoon Tea (J. G. Sowerby and H. H. Emmerson. Warne and Co.)—This is a very pretty book, with pictures after the fashion of Kate Greenaway's, but with much better rhymes. We particularly like the drawing of the two little Quakers coming from meeting, and of the five uncompromising pansies. Children are learning now what puzzled their fathers and mothers in *their* childhood, how it was possible to play in the quaint, old-fashioned dresses of the beginning of the century.

Jenny and the Insects (Illustrated by Giacomelli. Nelson and Sons).—In this book a great deal of information on the manners and customs of insects is conveyed through the conversations of a little girl with some of these tiny creatures. Children who are fond of natural history may learn much from its pages, but those who are not—a large class, it is to be feared—will throw it aside for lighter literature.

There is always the grave objection to such books as *A Popular History of Science* (Robert Routledge, F.C.S. Routledge) that people who are capable of reading and understanding this would also be capable of reading and understanding the standard works on the subject. Setting this objection aside, the book is valuable for containing an immense deal of matter, not only on astronomy, with its kindred sciences of electricity and optics, but on zoology, botany, and geology. Indeed the chief fault of the book appears to be that it has dealt with too many things with too great detail for a "popular history."

California (Rev. John Todd, D.D. Nelson).—This is an excellent account of California and its productions, told clearly, simply, and briefly. The drawings with which it is furnished give a good notion of the country.

Messrs. Marcus Ward seem to bear off the prize for the prettiest Christmas Cards. Little songs, with music, are neatly printed on the inside of tablets, charmingly decorated. Flowers, cats, collie dogs, jars, Japanese fans, and similar objects, are designed with care, and coloured with sumptuous indifference to expense. A very original card represents day dawning on the fleet of Hengist and Horsa as it approaches the shores of Albion.

Messrs. De La Rue's Diaries, pocket-books, and purses have reached us. These objects of art and usefulness scarcely need our praise, as their good repute has been won after the general experience of many years. While we admire the neatness of the waistcoat pocket-book, a kind of peaceful derringer among pocket-books, we cannot praise the blind-tooling or the cover of a larger article. The internal arrangements make up for the error of an artist who is not quite a Bauzonnet.

FRENCH CHRISTMAS BOOKS.

I.

THE French Christmas Books of this year seem to be thus far a good deal less interesting and amusing than those of last year. Since M. Bertall's series of volumes, which were alike interesting in letterpress and illustrations, has ceased to be continued so as to come in handily for the *étrennes* of the New Year, one naturally turns first to the books which the untiring M. Jules Verne continues to produce. An author who writes so much and so much in one style cannot be always at his best, and it is in M. Verne's case unfortunate for this year's book that last year's seemed a triumphant answer to the charge that its writer's invention was in danger of being worn out. *Les Cinq Cents Millions de la Bégum* was as good as anything that M. Verne had ever written. It bristled with exciting situations and impossibilities which the writer made possible, and was so artfully constructed that the interest of the reader never flagged until the end was reached. The characters had about them a pleasant melodramatic flavour, and the work was full of vigour and freshness when one had once got over the necessarily unexciting explanation which began it. From this *La Maison à Vapeur* (Hetzel et Cie) is a distinct falling off. The notion of a gigantic mimic elephant in which is contained a steam-engine, capable of dragging two huge cars or movable houses over the roads of India, is ingenious enough, and gives plenty of opportunities for exciting scenes; but these opportunities are employed with something less than M. Verne's accustomed skill. Nor can it be said that the situation upon which these scenes depend is an attractive one. The elephant-engine with its cars, or, as it is constantly called, "Steam-House," originally constructed to gratify the whim of a rajah, is bought by a certain Colonel Munro, between whom and the Nana Sahib there exists, for good reasons, on both sides a deadly feud. In his "matter of inducement" to this state of things, M. Verne has gone out of his way to say every ill-tempered and disagreeable thing that he can about the behaviour of the English troops to whom was confided the task of suppressing the Indian Mutiny. Indeed M. Verne's treatment of the matter recalls unpleasantly the times when no Frenchman spoke of England and Englishmen without more or less open detestation. This is, to say the least of it, impolite and injudicious. M. Verne is a clever writer of a kind of literature which he did not perhaps invent, but which he has certainly made popular, and in many cases deservedly popular, though it is doubtful whether the quackery mixed up with his scientific smatterings may not do some harm. However that may be, M. Verne is not, and never will be, an historian, and in future he will do well either to leave such great themes as he has here chosen to tamper with entirely alone, or to get some better instruction before he ventures on touching them. When M. Verne gets upon his own ground, he is generally amusing, if nothing else; but it must be confessed that in this book he is too often terribly dull. The adventures with savages, wild beasts, and so on, are, to speak familiarly, not a patch upon the adventures which Captain Mayne Reid would have made out of the same materials. It may be granted that they are as extravagant as, and even more extravagant than, the things which happened to the many persons young and old whom Captain Mayne Reid made dear to our boyhood; but their extravagance is a dry and deliberate extravagance which carries no conviction with it. The attempt at humour in the character of Mathias Van Guitt is a very poor attempt, depending as it does on an un-

successful imitation of a character devised by M. Alphonse Daudet. The secret of the madwoman known as *La flamme errante* is from the first an open secret; the scene in which her husband recognizes her misses great opportunities in the same way in which it contains great faults, and the end of the book is both dull and perfunctory. Altogether, M. Verne's performance of this year is both poor and disagreeable. It has, however, one remarkable merit. Many French writers would do well to copy and paste up in their studies this footnote:—"Une femme non titrée, qui épouse un baronet ou un chevalier, prend le titre de 'lady' devant le nom de son mari. Mais cette qualification de 'lady' ne peut précéder le nom de baptême, car dans ce cas elle est uniquement réservée aux filles de pairs."

In a less degree, but in the same kind, the merit of M. Biart's production this year is below that of last year. *La frontière indienne* (Hetzel et Cie) is full enough of incident of various kinds, but there is nothing in it to approach the excitement which he provided for his readers last year, and there is a certain pedantic air about the instruction thrown in which curiously illustrates some remarks made some time ago in these columns concerning some works of a different calibre. M. Biart's book, in short, gives new colour to the impression that "goodboyism" is a dangerously catching disease.

M. Dequet's *Histoire de mon oncle et de ma tante* (Hetzel et Cie) is, as to this matter, in pleasing contrast to the work just mentioned. Here we come again upon the good old-fashioned flavour of children's books. The hero of the book recounts his own mischief-making, as well as his better deeds, with an engaging and refreshing simplicity, and there is an air of reality about the whole story which is decidedly pleasing. "Mon oncle," "ma tante," the Cavalier François, M. Oscar, the terrifying Saint-Cyprien, and the hero of the narrative are all personages with whom we are glad to have become acquainted, and whose acquaintance we can safely advise young readers to make. The pictures are spirited, and correspond well with the text.

The *Histoire d'une montagne* (Par Elisée Reclus. Hetzel et Cie) is a work something after the manner of the late M. Viollet-le-Duc, the nature of which is sufficiently explained by its title. The style is good and clear, and the illustrations by M. Benett, who also illustrates M. Verne's book above spoken of, are capital.

The edition of *Les chroniques de J. Froissart* (Hachette et Cie), which is described as "édition abrégée, avec texte rapproché du français moderne, par Mme de Witt, née Guizot," is among the very best books of the season. The printing is as good as it can possibly be, and the illustration of the work, which comprises "11 planches en chromolithographie, 12 lettres et titres imprimés en couleur, 2 cartes, 33 grandes compositions tirées en noir et 252 gravures d'après les monuments et les manuscrits de l'époque," is a triumph of skill and care. Some of the "gravures d'après les manuscrits de l'époque" are delicious.

The two volumes for 1880 of *Le journal de la jeunesse* (Hachette et Cie) are well up to the mark, and are, as usual, full of artfully varied matter, calculated to attract boy and girl readers. People who want their children to learn to read French in a pleasant way might do well to take in this magazine.

In the *Aventures du prince Chènevis* (Hetzel et Cie) we recognize an old friend whom we knew and loved long ago in an English dress, under the title of *Prince Hempseed*. It is a confession of ignorance, but we must confess to having learnt with surprise that the book is by M. Léon Gozlan. The surprise was not one of an unmixedly pleasant character, for we learnt at the same time that M. Gozlan had written not only the book, which is charming, but also a preface to it, the pedantic and didactic character of which is very far from charming, and which in the English version was wisely suppressed. However, no one is obliged to read prefaces, and this particular preface had better be skipped by lovers of fairy stories. However M. Gozlan may prate, like the Counsellor in Hans Andersen, about "putting stuff into a child's head," the *Prince Chènevis* will rank as a fairy story, and by its excellence in that line will excuse the detestable preface to which we have referred. The wonderful feats which the little Prince and his troop of animals perform do not belong one bit less to the region of enchantment than do the "souris blanches qui se métamorphosent en chevaux," at which M. Gozlan was pleased to sneer in a high and mighty fashion. But, as we have said, the fact that, in spite of his sermonizing against fairy stories, he could not help writing what is in its essence a fairy story, and a very delightful one, condones his *lèse-féerie*. M. Bertall's illustrations to the story have lost nothing of their old charm.

In *Bébés et joujoux* (Hetzel et Cie) M. Lemonnier tells us of the curiously exciting dream of a wooden soldier, of various things which happened on a Christmas night, of the adventures of a toy commissionnaire, and of other pleasant matters, for which pleasant illustrations have been provided by MM. Geoffroy and Becker.

M. Laurie's adaptation from Captain Mayne Reid, called *Le chef au bracelet d'or* (Hetzel et Cie), is well done, and is capitally illustrated by M. Benett.

La pie de Marguerite (Texte par P. J. Stahl, dessins de Pirodon) is a bird of a most attractive character, whose tricks, friendships, enmities, and adventures will interest every right-minded child.

The facts that Charles Nodier wrote and Tony Johannot illustrated *Trésor des fèves et fleurs des pois* (Hetzel et Cie) are warrant enough for the excellence of the work to which M. P. J. Stahl has prefixed a well-considered and well-written little preface, at the end of which he says truly enough:—"*Trésor des fèves et fleurs des pois, Le génie Bonhomme, L'histoire du chien de Brisquet*, devaient trouver place à tous titres et avant tous autres dans une collection où l'on s'est proposé d'offrir aux enfants des livres qui, après avoir amusé leur jeune âge, pussent laisser dans leur souvenir d'autres traces que ces ouvrages médiocres qu'on met d'ordinaire entre leurs mains, et qui ne répondent qu'au besoin frivole du moment sans rien réserver pour l'avenir."

Une leçon d'équitation (Hetzel) relates and exhibits in coloured plates what happened to the Vicomte de ——, who was unfortunate enough to win a celebrated trick horse in a tombola got up at the Cirque Américain.

Mademoiselle Suzon (Hetzel) is well enough so far as the text goes; but the illustrations are among the most hideous things ever seen.

M. Stahl's *L'école buissonnière et ses suites*, with M. Jundt's drawings (Hetzel), can be safely recommended to our young friends as an amusing work.

GERMAN LITERATURE.

THE brothers Grimm (1) undoubtedly deserve to be regarded as the Dioscuri of German philology; and the appropriateness of the comparison is enhanced by the fact that, intellectually, one was immortal and the other mortal. If less eminent than Jacob Grimm, however, Wilhelm Grimm was in no respect less amiable, or a less honourable representative of the character of the scholar in its fairest development. Nor was he in any way inferior to his brother as a letter-writer, and their mutual correspondence during their occasional separations in their youth forms as creditable and agreeable a volume of the kind as has often been given to the world. It extends from 1805 to 1815, and falls into six sections, four comprising Jacob's absences from home, and two Wilhelm's. Three of Jacob's journeys were made to Paris, a place which he abhorred. From January to September 1805 he was there on a visit to Savigny; he accompanied the Allied troops thither in 1814, and was there again from September to December 1815. He was also at Vienna from September 1814 to June 1815. Wilhelm's visits were made to Halle from April to September 1809, and to Berlin from September to December in the same year. The subjects of the letters are usually the brothers' philological studies and undertakings, interspersed with family affairs, notices of recent books, and occasionally anecdotes of Brentano, Arnim, and other members of their literary circle. They give a most lively picture of their zeal in collecting materials for their works, of their manly patriotism and truly fraternal spirit, of their general simplicity, dignity, and devotedness. The only letters which diverge very far from the tranquil paths of scholarship are those from Jacob during the campaign of 1814, which record his observations on the behaviour of the conquerors, and the feelings of the French, but add little to our previous knowledge of the subject. Of the Vienna Congress he speaks with the usual aversion of patriotic Germans. Wilhelm's letters are in general the more entertaining and full of news. His deference to the senior and more celebrated brother is very marked and touching, and his affection is amply returned. On the whole, domestic, even more than literary, interest is the leading feature of this charming volume.

Biographies are so commonly unsatisfactory that he who deems himself entitled to one can hardly be blamed for taking the matter into his own hands during his lifetime. Such would seem to have been the illustrious Franz Liszt's course of action; for, although the work before us (2) bears the name, and is no doubt the *bonâ fide* composition, of L. Ramann, it is very evidently an inspired composition, in the sense in which inspiration is allowed to be no guarantee for infallibility. Herr Ramann condescends to no statement of the sources of his information, except in so far as concerns purely musical matters; and internal evidence demonstrates that, for all biographical, critical, and psychological details, resort has been made to the fountain-head. In Liszt's own hands, his biography assumes as much the guise of an *Apologia* as Cardinal Newman's, with the distinction that, whereas Newman's apology tended to show that no apology was necessary, Liszt is perpetually purging himself of his own sins by the easy expedient of confessing the sins of others. Anything irregular in music and morals is held to be as satisfactorily explained by a residence in Paris as a wet coat by a tumble into the Thames. We will not inquire too curiously whether Liszt would ever have been anything without the residence which brought him into contact with Chopin and Paganini, Meyerbeer and Berlioz, George Sand and the Countess d'Agoult. Thus much at least is clear, that without it Herr Ramann's biography would have possessed little interest or value except for musicians. The picture of the brilliant, but feverish, society of the first decade of Louis Philippe's reign is, however, highly attractive, absurd as is the attempt to represent it as the corrupter of one in whom all its failings were innate. The treatment of Mme. d'Agoult, in particular, must effectually dispose of

(1) *Briefwechsel zwischen Jacob und Wilhelm Grimm aus der Jugendzeit.* Herausgegeben von H. Grimm und G. Hinrichs. Weimar: Böhlau. London: Williams & Norgate.

(2) *Franz Liszt.* Von L. Ramann. Bd. 1. Leipzig: Breitkopf und Härtel. London: Williams & Norgate.

the notion that every Hungarian is *ipso facto* a high-minded cavalier.

Dr. Schliemann's sumptuous work on Troy (3), appearing simultaneously in an English version, will receive fuller and fitter notice in another place. Here we may draw attention to it as a magnificent example of what may be characterized as the English school of research, the method which makes it its first business to collect facts from which generalizations may be subsequently deduced. This implies no ignorant disdain of theory. Had Dr. Schliemann formed no theory respecting the site of Homeric Troy, he would have taken no practical steps; had he been a theorist and nothing more, his pen would never have been justified by his pickaxe. The simple putting of a spade into the ground has dispelled delusions which threatened not merely to unsettle the foundations of Greek history, but to confuse and pervert Greek mythology, and through it all other mythologies. Whatever may be thought of Dr. Schliemann's views on such comparatively minor matters as the identification of Priam's very palace and Agamemnon's actual tomb, he has at all events placed the historical groundwork of Homeric fiction, and the personality of Homer himself, among the rank of indisputable truths. Like most great things, the secret of this great success is exceeding simple; it is merely Dr. Schliemann's readiness to give Homer credit for knowing his own subject.

The correspondence of two such men as Gauss and Bessel (4) is naturally of the highest interest to astronomers and mathematicians. It commences in 1804 with Gauss's request to Bessel for assistance in calculating the geocentric positions of the newly discovered asteroids, and terminates in 1844. During the greater part of this period the number of letters exchanged annually is six or eight, and they relate, almost without exception, to important objects of research occupying the attention of the philosophers at the time. The more strictly astronomical portion of the correspondence commonly proceeds from Bessel, the mathematical from Gauss; and its lofty and disinterested tone is equally honourable to each.

The history of Herr Loehnis's (5) correspondence is a curious one. The letters were addressed by him to his son when placed at an Antwerp boarding-school, and are printed by the young gentleman as a testimonial to his schoolmaster. It does not precisely appear why their publication should be deemed a compliment to the latter; it is more obvious that the superhuman patience of the inditing father and the perusing son redound greatly to the credit of the house of Loehnis. They are really very excellent letters of advice and instruction, liberally garnished with judicious citations from approved authors; but it would be rash to guarantee them a much larger public in print than they have already enjoyed in MS.

A history of comparative philology would be a very useful work, and Herr Delbrück's (6) introduction is not devoid of merit as a contribution to the subject. The writer, however, has cramped himself by too exclusive an attention to the mere theory of philology. There must be something wrong in a method which, while Bopp and Grimm and Schleicher are mentioned with due honour, altogether obscures such landmarks in the history of philology as Rawlinson's decipherment of the Behistan inscriptions, or Prichard's demonstration of the Aryan affinities of the Celtic nations. Herr Delbrück has written a chapter in the story well enough to encourage him to attempt writing the remainder.

An introduction to Anglo-Saxon, by K. Körner (7), and a Gothic grammar by W. Braune (8), appear very useful introductions to their respective languages. The former is particularly recommended by a copious chrestomathy, with a vocabulary and copious notes.

Dr. Lotz's translation of the inscriptions of Tiglath-Pileser I. (9), the earliest of the Assyrian kings who have bequeathed any important inscriptions to posterity, is accompanied by a transliteration of the original according to the system of Dr. Schrader, and has enjoyed the advantage of a thorough revision by Dr. Delitzsch. It may therefore be assumed to present the ripest fruits of German scholarship in a department which, after an unaccountable delay, it is beginning to appropriate in good earnest. The inscriptions offer the usual monotonous chronicle of victories, sieges, submissions of enemies and the leading away of captives, interspersed with *Te Deums* to one or other of the seven principal deities invoked at the beginning of the whole. Some minor details, if only the translation is correct, possess special interest, such as the occurrence of elephants in Harran so late as Tiglath-Pileser's time; and the transplantation of useful trees and fruits from the territory of the conquered nations to Assyria.

The "Epiphanies" in the life of Christ (10) are his Baptism, Temptation, and Transfiguration. Herr Steinmeyer asserts the "reality" of them all, though it is not quite clear whether he understands their objective reality. A second volume will deal with the "Theophanies."

Kant's philosophy is investigated in two of its principal aspects by Herr Pfleiderer (11) and Herr Rehmke (12), whose works, though not professedly commentaries, are substantially based upon his. The former endeavours to show that the pursuit of individual happiness does not necessarily involve egotism; the latter propounds a theory of cognition only intelligible to trained metaphysicians.

Herr Thiessen investigates the origin of the Buddhist legend in the "Dhammapada" (13), where Buddha promises to restore the poor woman's son to life if only she will find a person who has never known sorrow. Similar stories exist in Western literature, and attempts have been made to show that the Buddhist version was derived from a Greek source. Herr Thiessen, however, seems to establish its independent origin very satisfactorily; and, in so doing, indirectly proves that the Greek version was borrowed—a conclusion all the more plausible when it is considered that the course of legend, like the course of empire, is commonly westward. It does nevertheless appear somewhat extraordinary that its beauty should have remained invisible until viewed through a Sanskrit medium, and that nobody should have recognized it while it was accessible to all scholars in Lucian's Life of the philosopher Demonax.

Edward Grisebach's well-known taste for the quaint and *recherché* in literature has found a legitimate gratification in his very elegant rendering of three Chinese novelettes (14) from the English. Two of these were originally translated by Dr. Birch, the third by R. Thom, with Dr. Birch's corrections. Herr Grisebach is perfectly justified in claiming for these tales more emotion, more variety, and in general a closer approximation to the European standard than is usually admitted. Their construction is irreproachable, and their frequent use of the supernatural is effective. Their defect is the want of any accurate or subtle discrimination of character; but this is a recent development, even in European novels. We should recommend Herr Grisebach to extend his researches to Mr. Giles's *Stories from a Chinese Studio*, where he will find abundance of tales more picturesque and imaginative than those he has rendered here, and, from their brevity, affording less ground for criticism on the score of imperfect portrayal of character.

Omar Khayyam (15), of whose name ten years ago hardly any Englishman had heard, may now be almost regarded as a naturalized English author, thanks to the masterly version of Mr. Fitzgerald. Our literature affords few examples of so successful a transplantation from one language into another; but the result could not have been attained in English without an extremely free treatment of the Persian text. How free this has often been appears from the more accurate rendering of Herr Bodenstedt, which may win for Omar the same general estimation among poetical readers in Germany as he already enjoys in England. While, however, Herr Bodenstedt's translation is far closer than Mr. Fitzgerald's both in verbal fidelity and closeness to the spirit of the original, Mr. Fitzgerald has greatly the advantage in point of form. The metre he invariably adopts is a fair representative of Omar's, and bears a Persian stamp; but every distinctive trace of Orientalism frequently seems to have disappeared from the variety of lyrical measures employed by Bodenstedt. With this reservation the translation of the latter may be heartily commended on the grounds of elegance, poetical feeling, and completeness, presenting the thought of Omar in its entirety, and not a single phase of it only, as Mr. Fitzgerald has done. It is true that the unity of impression is thus impaired, and that the reader feels the difficulty of harmonizing the poet's apparently contradictory utterances. Herr Bodenstedt rejects both the mysticism attributed to Omar by M. Nicolas and the scepticism imputed to him by Mr. Fitzgerald. The key to Omar's mood has, he thinks, been found by an English lady, the author of a valuable essay upon him in *Fraser's Magazine* for May 1879. Omar's sceptical sallies, Mrs. Cadell points out, are generally confined to the anthropomorphic creed of Islam, with its singular mixture of inexorable fatalism and uncontrolled caprice. When not thus indirectly polemical, Omar is reverent, and many of his finest strophes are animated by deep religious feeling. In a poetical point of view, Bodenstedt's translation is an advance even upon his renowned *Mirza Schaffy*; and it is impossible to speak too highly of the exquisite taste displayed in its typography and general ornamentation. The pieces are arranged

(3) *Ilios: Stadt und Land der Trojaner.* Von Dr. H. Schliemann. Leipzig: Brockhaus. London: Williams & Norgate.

(4) *Briefwechsel zwischen Gauss und Bessel.* Herausgegeben auf Veranlassung der Königlich Preussischen Akademie der Wissenschaften. Leipzig: Engelmann. London: Williams & Norgate.

(5) *Briefe meines Vaters.* Herausgegeben von C. A. Loehnis. London: Trübner & Co.

(6) *Einleitung in das Sprachstudium; ein Beitrag zur Geschichte und Methodik der vergleichenden Sprachforschung.* Von B. Delbrück. Leipzig: Breitkopf und Härtel. London: Williams & Norgate.

(7) *Einleitung in das Studium der Angelsächsischen Grammatik, Text, Uebersetzung, Anmerkungen, Glossar.* Von K. Körner. 2 Thle. Heilbronn: Henninger. London: Williams & Norgate.

(8) *Gothische Grammatik; mit einigen Lesestücken und Wortverzeichniss.* Von W. Braune. Halle: Niemeyer. London: Williams & Norgate.

(9) *Die Inschriften Tiglathpilesers I. in transskribierten Assyrischem Grundtext, mit Uebersetzung und Kommentar.* Von Dr. Lotz. Leipzig: Hinrichs. London: Williams & Norgate.

(10) *Die Epiphanien im Leben des Herrn.* Von F. L. Steinmeyer. Berlin: Wiegandt und Grieben. London: Williams & Norgate.

(11) *Eudämonismus und Egoismus.* Eine Ehrenrettung des Wohlprinzips. Von E. Pfleiderer. Leipzig: Barth. London: Williams & Norgate.

(12) *Die Welt als Wahrnehmung und Begriff.* Eine Erkenntnisstheorie. Von J. Rehmke. Berlin: Reimer. London: Williams & Norgate.

(13) *Die Legende von Kisâgotami: eine literarhistorische Untersuchung.* Von J. H. Thiessen. Breslau: Köbner. London: Williams & Norgate.

(14) *Kin-ku-ki-kuan: neue und alte Novellen der Chinesischen 1001 Nacht.* Deutsch von E. Grisebach. Stuttgart: Kroner. London: Nutt.

(15) *Die Lieder und Sprüche des Omar Chajjam.* Verdeutscht von F. Bodenstedt. Breslau: Schletter. London: Trübner & Co.

in ten books, according to subject—an excellent plan, which contributes greatly to the correct apprehension of the poet's thought. No one, for example, will believe that the writer of the pieces brought together in the first book, or Book of Religion, can have been a Persian Lucretius in anything but the exceptional character of his genius, however sceptical or sensuous may appear some of the other moods of his varied and impressionable nature. Bodenstedt justly compares some of these beautiful and large-minded utterances to Goethe. This translation is in no respect a critical edition, and, after all M. Nicolas's labours, much, no doubt, remains to be done for the settlement of the text and weeding out of the questionable *Rubaiyat* frequently attributed by MSS. to Omar Khayyam.

"Italian Plaster Figures" (16) is a collection of lively tourist sketches from the South of Italy, chiefly remarkable for the unfavourable view taken of Italian economical and educational prospects. Some critical papers are appended, the most remarkable of which is an account of the attempts of the Italians to translate *Faust*.

"Odin's Comfort," by Felix Dahn (17), is a romance of the eleventh century, intended to depict the feelings of the adherents of the expiring Norse mythology in the same manner as Ibsen and Rydberg have painted the classical romanticism of the age of Julian. With some eccentricity and affectation, and a great deal too much of "apt alliteration's artful aid," it is nevertheless a vigorous story, enlivened with many imaginative legends from the Scandinavian mythology.

The subject of Adolf Stern's "Last Humanists" (18) affords much scope for picturesque situations, of which the author has skilfully availed himself. The contrast between the last wrecks of Italian culture after the Papal and Jesuitical reaction and the wild surroundings of the Baltic island where fate had flung them is powerful and suggestive; and, although Giordano Bruno himself speedily disappears from the scene, the strife between humanity and barbarism, of which he is one of the chief representatives, continues to form the animating motive of the story. The collision of these conflicting principles is powerfully depicted, and the reader's sympathy is ably enlisted on the side of the children of light.

"The Poetess of Carcassonne," Paul Heyse's contribution to the December number of the *Rundschau* (19), is a carefully written story of serious interest, full of incident and variety, laid in Provence in the period of the Troubadours, but with no especial pretensions to accuracy of local colouring. Catharine II.'s correspondence with Baron Grimm is reviewed by Karl Hillebrand, who draws a flattering picture of the great Empress, whose cheerful and kindly letters, devoid of reference either to the ruthlessness of her policy or the disorders of her private conduct, represent her in a much more favourable light than State cares and Court etiquette allow to most sovereigns. *Mutatis mutandis*, they are very much such letters as Augustus may be supposed to have written to Mæcenas and his circle. The most interesting of the other papers is one treating of the ethnological changes undergone, and to be undergone, by Asia Minor.

THE STATE OF IRELAND.

ONE of the oddest commentaries which have yet been published on the miserable condition of Ireland was contained in a speech lately delivered by no less a person than the SPEAKER. Mr. BRAND seems to have considered that his exalted and neutral position imposed upon him the duty of serene impartiality between right and wrong; or perhaps he has really persuaded himself that the assassin and conspirator who executes the mandates of the Land League is the comic and sentimental Irishman of farce and melodrama. Mr. BOUCICAULT would probably agree with the SPEAKER that the race has many high qualities; and he would admit that the generous, brave, and impulsive Irishman is too ready to listen to injudicious advisers. Agitators take advantage of his venial weakness to lead him into courses which may perhaps ultimately prove injurious to himself. The SPEAKER forgot that systematic robbery and cruelty are injurious to their victims as well as to their agents. The labourers who have been persuaded by their priest to abandon well-paid employment may possibly suffer inconvenience; but ordinary Englishmen are more ready to sympathize with Mr. BENCE JONES than with the ungrateful dependents who were indebted to him for security and comfort. There is no doubt that Irishmen possess a fair share of the common virtue of physical courage; but the SPEAKER might have reserved his compliments on their bravery for a time at which they were not exhibiting abject submission to lawless despotism and practising habitual oppression of the weak. The rabble to which the French Convention truckled during the Reign of Terror exacted and received similar adulation. It would have better become a grave dignitary who will soon have to deal with the Irish demagogues in another capacity either to keep silence or to express the indignation which he must be supposed to feel. Nonsense for nonsense, the theory that the faults of Irishmen are due to the neighbourhood of a melancholy ocean is less offensive than the explanation of sordid cupidity, combined with malignant turbulence, by an amiable susceptibility to sudden impressions.

Mr. BRAND's constituents would have been satisfied if he had declined to address them on a subject with which it would have been improper for him to deal freely. He could not be expected to discuss the administrative questions which are much more urgent than any curious investigation of the peculiarities of Irish character. The Government, as a whole, has neglected its duty; but the motives of some of its members are probably patriotic and unselfish. The Liberals, as distinguished from the Radicals, may reasonably believe that they are not at liberty to abandon their posts as long as there is a hope that they may exercise either a stimulating or a restraining influence on their colleagues. All but the most bigoted democrats may perhaps gradually be shamed into the performance of a plain duty, and their revolutionary projects of legislation may be modified; yet Mr. JACOB BRIGHT publicly exults in the outrages which may, as he thinks, promote his objects. It is not known whether at the last Council the Cabinet agreed either on a Peace Preservation Bill, or on a scheme for the readjustment of land tenure; but it is certain, as long as the Cabinet holds together, that the policy of coercion has not been definitively renounced, and that property in land has not been finally doomed to confiscation. The guilt of tolerating anarchic tyranny up to the present time rests with Mr. BRIGHT, Mr. CHAMBERLAIN, and perhaps with two or three other members of the Government, including its chief. The cant of constitutional scruples furnishes no apology for deliberate complicity with crime. The functionaries who would have had to execute a temporary law for securing property and life cannot be allowed to express their fears that they might themselves have misused exceptional powers.

The contrary affectation of professing to believe that coercion would be ineffective is generally accompanied by a pretended confidence in the sufficiency of the ordinary law. The sympathizing apologists of the Government have lately exerted themselves to prove that threats, outrages, interference with freedom of action, and riotous excesses, are misdemeanours punishable with fine and imprisonment. They accordingly censure the magistrates, the police, the permanent staff of the Irish Government, and by implication Mr. FORSTER himself, for allowing the regular weapons of the law to rust while new armaments are loudly demanded. Some zealous philanthropists even taunt the peaceable classes in Ireland with cowardice in not defending themselves. A few landlords and one spirited lady, who have hitherto intimidated assassins by their gallant demeanour, are contrasted with the great body of victims who meanly ask for the protection of the law. A state of private warfare is approved as preferable to a vigorous and summary repression of crime by the constituted authorities. In one of his writings Sir JAMES STEPHEN contrasts the irresistible force of the law in civilized society with the violence of predatory barons and moss-troopers as it is picturesquely described in the *Fair Maid of Perth*. Honour is due to gallant Irishmen who, like the hero of the romance, fight for their own hand when they are deserted by their natural protectors. Corresponding dishonour attaches to those who render self-defence necessary by a base abdication of their duty. It is true that the most effective Peace Preservation Act would leave too many opportunities for crime; but former measures of the kind have done much to repress disorder; and it must be remembered that the opponents of exceptional legislation object, not to the supposed inutility, but to the efficiency, of coercive legislation.

The latest proceedings of the club which governs Ireland furnish an additional, though superfluous, reason for immediate and energetic interference. The tardy fulfilment of Mr. GLADSTONE's broken promise would even now have the effect of resolving the Land League into two of its uncongenial elements. Of late its nominal adherents have been recruited, not merely from malcontents and covetous aspirants to the property of others, but from peaceable traders, and even from loyal subjects who have no kind of sympathy with the conspiracy or its promoters. A member of a Manchester firm writes to the papers to say that their representative in a town in Ireland has consulted his principals whether he shall subscribe to the Land League or incur the penalty of a total suspension of business. He has been instructed to recognize the only existing authority. The leaders of the League have on some occasions hypocritically deprecated the practice of forcing unwilling persons to subscribe to their funds, but they receive the money without inquiring into the mode by which it has been procured. The barbarous process which takes its name from its earliest victim has been found

applicable to universal coercion, and especially to the extortion of money. There is no doubt that in every instance in which a subscription is obtained by threats an indictable crime has been committed; but after the acquittal of HEALY and WALSH it is as useless to prosecute the offenders as it would have been to impeach FOUQUIER-TINVILLE and his accomplices, the official jurymen, during the reign of ROBESPIERRE. The demagogues and some of their wellwishers at Birmingham and elsewhere describe "Boycotting" as a legitimate mode of employing moral force, analogous to the extremely questionable methods sometimes employed by Trade-Unions. It would not suit their purpose to admit that behind the sentence of social excommunication physical violence lies in the background. Labourers would not refuse remunerative wages, tradesmen would not reject profitable custom, if they were not well aware that their refusal to obey the commands of the League would be punished by torture, by mutilation, or by death. The cowardly steamboat agents who refused to convey Mr. BENCE JONES's cattle to England apprehended either incendiary plots or explosions, or perhaps the compulsory desertion of their men. If they had performed their duty and suffered the possible consequences, the owners might perhaps have asked the Ministers for compensation; but they would, like Captain BOYCOTT, have been informed in answer that the Government was preparing beneficent legislative measures.

The LORD-LIEUTENANT, or the IRISH SECRETARY in his name, has prohibited one meeting of the Land League. A sufficient military force was ordered to the spot to suppress resistance, and the populace consequently submitted. The interference of the Executive, though laudable in itself, suggests the question why seditious and formidable assemblages have for several months been allowed to propagate disorder with impunity. At every Land League meeting it is certain that menaces will be uttered against peaceable subjects, and that the threatened consequences will result to those who refuse compliance. The contemptible scruples of Ministers who shrink from coercion are answered by a universal system of compulsion. When the Government, after long acquiescence in triumphant wickedness, at last appeals to Parliament for additional powers, it will be difficult to abstain from calling attention to a practical confession of its own criminal weakness. It is even possible that unforeseen consequences may result from a paltry and selfish policy. The ultra-Radical faction still cordially supports Mr. GLADSTONE, but he may perhaps find that he has alienated a sufficiently large proportion of his late supporters to destroy the majority which raised him to office. Within living memory no Minister has caused indignation so general and so profound among the orderly classes of society. It remains to be seen whether he will be compensated for the disapproval of moderate and patriotic Englishmen by the zealous support of those who, like Sir WILFRID LAWSON, would rather dismember the Empire than restore order in Ireland by force.

THE OLD YEAR AND THE NEW.

THE dying year must always leave bad legacies as well as good to the new. There is sure to be trouble and confusion, perhaps present, and certainly prospective, somewhere. And in most years there is naturally a pause in action at the time when the old year is giving place to the new. It is winter, and military operations are postponed. The English Parliament has not met, and although Continental Parliaments meet in the late autumn, the greater questions are generally reserved for the spring of the year. As a rule, therefore, at this season, what most interests us lies in the near future rather than in the present. What is peculiar in the state of affairs at the close of this year is that, while there is nothing very alarming anywhere, and in the economical and financial position of the leading countries of the world there is much to inspire confidence, yet it so happens that in almost every one of these countries, except the United States, there is some one or more question or questions which we know must be solved somehow very soon, and of which the solution is at present quite undetermined. It is the distinctness of the issues to be decided, coupled with the extreme indistinctness of the mode in which they will be decided, that makes the peculiarity of the present crisis. We do not say, as we usually do, that in the new year something may happen; but we say that something must happen, only we do not know what this something will be. At the same time there is, amid all this uncertainty, a feeling that, if there is much to alarm, there is much to reassure us. We need not take a black or pessimist view of any of our troubles or of the troubles of our neighbours. Things in the new year may turn out very badly, as they may in any new year, but there is now no very clear reason why we should necessarily conclude that they will turn out very badly. The most conspicuous instance is naturally that which interests all Europe alike. The Greek question, we know, must be solved somehow in the new year. This certainly is a distinct and peculiar legacy of the old year to the new. We are not, as at the end of ordinary years, merely able to say that something unpleasant may before long grow up in Eastern Europe to tax the skill and resources of statesmen and nations. There is something unpleasant in Eastern Europe actually going on; and it must have some final form given it before many months are over. Unless diplomacy can settle the Greek question before the spring there will be war. It is quite possible that there may be war; but what is to some extent reassuring is that diplomacy is evidently very much in earnest in its endeavour to prevent war by arranging a settlement. The Great Powers, however much they may differ in other respects, are cordially united in the desire not to let things drift; and experience shows that most wars arise precisely because things are allowed to drift.

At home there are several distinct questions which we know must be settled one way or the other in the new year. For example, we must either keep Candahar or retire from it; or, even if a middle course were taken and we kept Candahar, but kept it only for a time, we should have to state clearly in what way or on what terms and with what objects we meant to keep it temporarily. The present curious state of things, in which we hold Candahar neither on our own account nor on that of any one else, cannot continue. In South Africa we do not know what will be the end of the war between the Cape Colonists and the natives, how far the resistance of the Boers may be serious, or whether new troubles may not arise in districts directly under the government of the Crown. But we know that, whatever turn events may take, the relations of the Home Government to the Colonial Government of South Africa must be much more accurately defined than they are now. What is reassuring as to Candahar and South Africa is that responsible Ministers will have had every opportunity of coming to a right decision. They may make great blunders, but at any rate they ought not to make them so far as plenty of opportunity for thought and study and consultation can save them from making blunders. Again, nothing can be more deplorable than the state of Ireland. Every day the new Government edges the old Government out of something that seemed still to belong to it. What used to be called Irish anarchy, but may now be fairly called a well-organized reign of terror in Ireland, is a very bitter legacy for the old year to leave to the new. But here, again, we know that in the new year there must be a solution of some sort. There must be a serious effort to make Ireland possibly contented and certainly orderly. This effort may be successful or unsuccessful, but we are sure that it will be made, and that it will be begun to be made in a very few weeks. It may be thought very difficult to find anything reassuring as to the future of Ireland. The law has collapsed, and even worse perhaps than the actual collapse itself is the poisonous experience that law can be made to collapse. But, even with regard to Ireland, there are some things to be noticed which, if they do not inspire confidence, tend in some small way to mitigate anxiety. In the first place, sorely tried as Englishmen are by the intolerable tyranny prevalent in Ireland, they do not go back from their wish to treat Ireland fairly. If any measure that would make the Irish happier could be shown to be at once practicable, just, and reasonable, Englishmen would still be pleased to welcome it; and the persecution to which the landlords have been subjected will dispose Englishmen to be more compassionate to these victims of oppression, and more ready to see that any indemnity to which they can fairly lay claim shall be given them. Then it is something that a great opportunity should be given to any one man in a very difficult crisis. There is, to all appearance, no wavering in the constituencies in their feelings towards Mr. GLADSTONE. They are puzzled by

what the Ministry does, or rather by what it leaves undone; but they still cling to the belief that Mr. GLADSTONE is a sort of magician, and that he has some secret power of settling the Irish or any other question. This belief may be utterly unfounded, but at least it gives a chance for a Ministerial success which would not exist without it. Lastly, we may hope that we have now got rid of Home Rule for many years to come. Formerly we could only speak theoretically, and say that if the Irish were allowed to set up a government of their own under the nominal supremacy of England, they would be sure to set up a very bad government. Now we can speak practically. The Irish have set up a government of their own under the nominal supremacy of England, and it is a government of petty, remorseless tyranny. We now know what we previously could only deduce from history or from general study of circumstances and characters—that the elementary duty of England towards Ireland is to save the Irish from themselves.

In France there are so many burning questions all flaming at once that it may seem difficult to say what it is specially that the old year leaves to the new. But all these questions may be gathered into one great question. What will be the issues on which the country will be asked to pronounce its judgment when the time for the general election comes round? The Republican party wishes, or, at any rate, its more advanced members wish, to get certain things done, some of a sufficiently startling character, and then to ask the electors to ratify them. If we translate Republican opinions into action, they say, there must be certain consequences, and we wish to point out to the country what these consequences are. If the country likes them, it has only to say so; but the great thing is that the country should know what is meant. In Germany the question that has to be decided next year is of a very different kind. But to Germany itself it is a question of very great moment. It is the question whether the Government in its war with Socialism shall or shall not commit itself to a counter movement, in which it would parade a Socialism of its own contrivance. Prince BISMARCK has for some time past allowed it to be known that he is meditating a plan for a new organization of labour. What is the exact form his plan is likely to assume is not known, and perhaps he hardly knows himself. But its basis is the basis of Socialism, or at least of that form of Socialism which purposes to use the State as its instrument, and may be shortly described as the protection by the Government of the workmen against competition, bad times, and the misdirection of capital. Prince BISMARCK must be supposed to know Germany well, and he is evidently not satisfied with the results of the laws by which he has endeavoured to repress Socialism. The inhabitants of considerable towns no longer talk Socialism in beer-gardens, or enjoy an uninterrupted flow of Socialist journalism; but, when they get an opportunity of voting, they are not to be kept from voting for Socialist candidates. As Prince BISMARCK has given the public a vague sketch of his new ideas, he must either give effect to them when the German Parliament meets, and suggest changes affecting the whole character of German society, or drop them, and thus reveal that he does not think it possible to combat Socialism by outbidding it. Either way the world will learn something in which it will be much interested as to the attitude which the master of Germany intends to assume on what, in his eyes, is the one great question of the day for Germans after that of the existence of the Germany into which he has shaped the Fatherland.

SOUTH AFRICA.

THE accounts of the war in South Africa continue to be scanty and, with few exceptions, unsatisfactory; but thus far the Colonial Government adheres to its resolution of conducting the struggle itself without resorting to the aid of Imperial troops. A part of the not inconsiderable force at Cape Town might probably be employed with decisive effect; and if the colonists are at any time hard pressed, the reserves of the garrison may perhaps be required. But it would be unwise to urge on the Colonial Government the acceptance of military aid; and the unfortunate rebellion which has at length broken out in the Transvaal may too probably require the employment in that province of all the available British troops in South Africa. The Boers have evidently taken the opportunity of the Basuto war to embarrass the English Government. Their countrymen in the Orange Free State had been more considerate and more prudent. The motives of an offer of Imperial help in the Basuto war would be regarded with suspicion, and no gratitude would be felt for benefits which would be attributed to a desire of retaining control over the colonial policy. In the Gaika war of two or three years ago, though the rebellion was mainly suppressed by the Imperial troops, Mr. MOLTENO and his colleagues affected to act independently of the Commander-in-Chief of the regular forces. Mr. MOLTENO's successor has professed a more friendly feeling to the mother-country; but he evidently regards with jealousy any measure which might interfere with independent local action. If Mr. SPRIGG accurately represents the general feeling, the determination of the colonists to bear the whole burden of the war is highly respectable. As none of the native levies can be trusted, the settlers must bear the danger and hardship as well as the cost of the war. The number of volunteers in the field is already considerable, and large reinforcements seem to be expected. It is too late to discuss the policy of disarmament, which has been sufficiently condemned by its results. The loyalty of the Basutos, though it has been easily disturbed, might perhaps have continued but for the injudicious exhibition of distrust. It is now known that the possession of firearms is regarded by the whole native population as the most valuable of privileges. The demand for the surrender of arms was probably regarded as an act, not only of oppression, but of bad faith. The native labourer in the diamond fields had in almost all cases, with the knowledge of the authorities, received guns and ammunition in lieu of wages. Mr. SPRIGG's Bill, though it was perhaps defensible in theory, has proved to be rash and mischievous; but war, especially when the combatants are respectively civilized and savage, supersedes the merits of the original quarrel. Whether the Basutos were right or wrong in rebellion, it has become necessary to suppress their resistance. It is to be hoped that the difficulty will not be seriously aggravated by the very unfortunate insurrection in the Transvaal.

In a late number of the *Nineteenth Century*, Lord GREY published a forcible argument against the policy which the Colonial Office has for many years pursued in South Africa. No living statesman has an ampler knowledge of colonial questions, though Lord GREY's official career ended many years ago. The concession by his successors of legislative independence to the larger colonies has never met with his cordial approval. The experiment has not yet disclosed its ultimate results, and it is in some respects anomalous; but in Canada, and probably in the Australian colonies, the grant of responsible government was the only alternative of separation. It is possible that the catastrophe may, even by unlimited concession, not have been finally averted; but the Imperial Government was fully justified in postponing disruption, with a reasonable prospect of maintaining for an indefinite time a bond of union too elastic to be oppressive. On the present occasion Lord GREY abstains from reopening the general controversy on responsible government. He is only concerned to prove that the system was inapplicable to South Africa, which contains both a European population and a much larger number of natives. He might have added that the English inhabitants of the colony were by no means unanimous in wishing for practical independence. They found themselves left face to face not only with the coloured tribes, but with a majority of Dutch descent, which is by no means completely amalgamated with the English portion of the community. If the question were still open much might be said on both sides; but Lord GREY underrates the difficulty of revoking an organic concession, even though it may have been premature. His strongest objection to the measure is founded on the withdrawal of the protection of the Crown from the natives settled in the colony, and from the neighbouring tribes, who may, as in the present instance, be provoked to war. It may be readily admitted that a so-called constitutional government secures but a precarious protection to an inferior race. It would, as Lord GREY candidly allows, be impossible to place the control of a representative Government at the Cape in the hands of a native majority. The arrangement which has actually been made is in itself just and reasonable. The natives are legally competent to vote, and some of them exercise

the privilege; but the franchise is designedly fixed so high as to exclude the great mass from participation in the suffrage. The precautions against the preponderance of uncivilized voters must be incidentally advantageous in protecting the white community from the baneful system of universal suffrage. The Government of a Crown Colony is undoubtedly more impartial than a Parliament and Ministry representing the superior race; but, in fact, the natives at the Cape have not been oppressed; and it is doubtful whether border wars would under any system of administration have been more infrequent. The Caffre wars of the last generation were fought long before the establishment of responsible government.

Lord Grey's object in discussing South African policy is not mainly critical or retrospective. Concurring in this respect with the deputations which have remonstrated with Lord Kimberley, he proposes active interference with the conduct and results of the war on the part of the Imperial Government, and he even holds that it will be neither impossible nor difficult to obtain the consent of the colonists to a surrender of their constitutional privileges. In the absence of positive evidence to the contrary, it may be confidently assumed that the people of the Cape would resist and resent any proposal of the kind. If there really were any desire to resume the former relations with the Crown, the movement ought to begin and proceed within the colony itself; but it is scarcely worth while to consider so improbable a contingency. Lord Kimberley can have known nothing of any colonial opposition to responsible government when he assured the last deputation which waited upon him that a restoration of the direct authority of the Crown was wholly out of the question. No stronger proof can be given of the disposition of the colonists than their present determination to undertake all the efforts and sacrifices required by the Basuto war. In common with Lord Grey they foresee that, if their own exertions are successful, they will be able to determine at their pleasure their future relations with the conquered enemy. Lord Kimberley properly declined to give the Colonial Ministry any promise that the Crown would not interfere in any future settlement; but the power of the victorious colonists to act for themselves will include the right which might in another contingency be disputed. It is natural that Lord Grey, and many younger philanthropists, should regret and disapprove the abandonment of a duty and right which was formerly vested in the Crown; but experience shows that European immigrants in uncivilized countries will always settle their own quarrels with the indigenous population. The North American colonies fought and negotiated with the Indian tribes without consulting the Government at home; and, indeed, they enjoyed many elements of practical independence long before the name of responsible government was invented.

The course of modern colonization has been determined by natural causes. Private adventurers first settle on shores only occupied by uncivilized tribes; and then it becomes necessary for the Government to which they owe allegiance to follow them with control and protection. As long as the colony is weak, especially when it is exposed to the attack of hostile neighbours, the rule of the mother-country is willingly accepted. When conflicts of interest or feeling arise the distant subjects become mutinous, if their aspiration to the management of their own affairs is violently thwarted. Since the success of the American rebellion, England at least has virtually abandoned the pretension of retaining possession of colonies by force. Even if Lord Grey is right in his opinion that responsible government was extended too hastily to South Africa, the concession must have been made at no distant period. Many years before, a troublesome collision had occurred when the colonists refused to receive convicts transported to the Cape. It was then found necessary to surrender a legal right which had been up to that time exercised without dispute by the Imperial Government. The claim of a Crown protectorate over the native tribes in South Africa may be plausible, but it cannot be asserted in practice. The situation may perhaps be in some degree modified if the Government of Natal, which is still a Crown colony, is forced to take part in the war; but for the present the Cape is conducting the struggle without assistance. Basutoland is theoretically included in the limits of the colony, for the unfortunate Disarmament Act was a measure of domestic legislation. If the natives are forced to submit, they will have one security against oppression in the proof which they have given of their formidable military qualities.

THE CRUSADE AGAINST RELIGIOUS EMBLEMS.

THE French Senate is evidently disposed to resent the extremely Radical policy which M. Ferry's Cabinet has thought it necessary to pursue. Whether it will give effect to its disposition when really important questions come before it is a point upon which it is difficult to form an opinion; but upon minor questions, or what it supposes to be minor questions, and upon the early stages of great questions, it has lately been markedly restive. The Committee appointed to examine the Bill making judges removable at the pleasure of the Executive is decidedly opposed to the change; and on Tuesday the Government were defeated, by a large majority, on an incident arising out of the Bill abolishing religious teaching in schools. If that Bill passes, every communal school will be strictly neutral as regards religion. The priest will be allowed, for the present, to teach the children religion on Sundays, but the rest of the week will be given up entirely to more important matters. The banishment of religious teaching will naturally involve the banishment of religious emblems. If the history of the Crucifixion may not be told to the children by the teachers, it would merely suggest inconvenient inquiries to leave the crucifix hanging on the wall. As yet the Bill making this change has not passed the Chamber of Deputies, and when the Chamber has voted it, it will still have to pass the Senate. These delays are naturally irksome to the burning zeal of the neo-atheists who govern Paris, and the Prefect of the Seine has accordingly availed himself of a regulation lately made by the Superior Council of Public Instruction, by which the local authorities are left free to deal with religious emblems as they think best. In the case of Paris there could not be much doubt what the action of the local authorities under this permission would be. It is probable that M. Hérold would have been satisfied with the simple removal of religious emblems from the schools, but it would have needed very special pains on the part of the Prefect to ensure that they were removed decently. The opportunity of insulting religion under cover of carrying out an administrative decree was too precious to be lost, and, after every allowance has been made for exaggeration, it seems to have been made full use of. The removal of the crucifixes was effected during school hours, and in the presence of the children. They were detached from the wall with poles and hooks, many of them being broken in the operation, and then thrown into a furniture van and carried off. The feeling which this outrage upon their religion has excited in French Catholics may be compared to that which would be produced in England if the Metropolitan Board of Works, under the guidance of Mr. Bradlaugh, were to collect all the Bibles to be found in Board schools and cart them away. The feeling in Paris is more keen than this, in proportion as a statue is a more striking object than a book. French officials are not always very gentle in their behaviour, and when, as here, the execution of their orders was a labour of love, there is little doubt that their words and acts were designed to be, and succeeded in being, extremely offensive. M. Hérold had no reply to make to his opponents on Tuesday, beyond the statement, which was not disputed, that the Prefect had a technical right to do what he did. The Republican Senators can stand a good deal in the way of Radicalism, but this latest exhibition of it was too much for a large number of them. Some boldly voted against the Government; others, less courageous, abstained from voting at all; and in the end the Government was beaten on a division by 159 votes to 85. For a few hours it was thought that the vote would bring on a Ministerial crisis, and M. Hérold even went so far as to place his resignation in M. Ferry's hands. On reflection, however, the Government seem to have thought that the Senate would be most effectually snubbed by taking no notice of its vote. The Prefect of the Seine has, therefore, been told that he must contrive to put up with the censure of the Second Chamber, and as life under such a condition entails no physical discomfort, and some additional popularity, he has found no difficulty in obeying the order.

M. Ferry, in defending the action of the Prefect, made

the usual remark that the neutralization of the communal schools involved no attack upon religion. In theory, no doubt, this is true. According to the view favoured by the Government, the school and the Church are in future to be distinct. In the Church there will be religious teaching, crucifixes, and statues of the Virgin. In the school there will be secular teaching, maps, and botanical and zoological diagrams. But M. Ferry takes no account of the effect which the absolute banishment of religion from communal schools may be expected to have upon the children attending them. If these schools had been founded in the first instance upon the principle of religious neutrality, it would have been different. The children would never have learned to associate religion with school; but they would not have regarded the two as in any way antagonistic. When, however, a sudden divorce is effected between them; when the teachers from whom the children have hitherto received their religious instruction are forbidden to give it them any longer; when the crucifix, which has till now hung over the teacher's desk, now hangs there no more; when, in short, religion is not merely excluded from the school, but ostentatiously turned out of doors, the impression conveyed will be much more serious. So far as the children are concerned, the removal of the crucifixes from the walls of the school is almost as startling as their removal from the walls of the church would be to their parents. Their religious impressions are suddenly uprooted, and they are left to ask, as some of them did on the occasion of M. Hérold's recent proceedings, What is to come in the place of the *bon Dieu* who has been taken away? In face of a law of this kind, it is impossible to contend any longer that the Republic is not hostile to the Church. The acts of the Government in regard to education are the acts of an enemy, not of a ruler who, while determined to give the Church no favour, still wishes to leave it a fair field. If the end which those Education Bills have in view had been simply protection for non-Catholic children, it might have been attained without any of the inconveniences which are likely to attend the execution of the new laws. Due care might have been taken that instruction in the Catholic religion was not forced upon non-Catholic children; but, provided that these precautions were sufficiently stringent, the religious emblems might have been allowed to remain. It is highly unlikely that in a country like France, where crucifixes are to be seen so frequently, the presence of one on the wall of the school can have any proselytising influence on the mind of a non-Catholic scholar.

No doubt a moderate measure of this sort would have had no attractions for the present Government. It is not unfair to suppose that what really delights them in the Education Bill is the prospect of making short work with all the signs that go to show that Catholicism is still the religion of a great number of Frenchmen. If this were not their motive, they would have contented themselves with one of those convenient compromises which secure all that is of practical moment while giving the minimum of offence to those at whose expense it is secured. In M. Ferry's ideas of government compromise has no place. With him manner is more important than matter, and the protection of non-Catholic children against proselytism is subordinate to the supreme end of humiliating Catholics. There is a certain coarse common sense about this line of action, inasmuch as it tends to some extent to win the support of the Extreme Left. They despise M. Ferry as sincerely as they have despised all the other Prime Ministers who have held office by permission of M. Gambetta, but they do not seem so eager to put him in a minority. A President of the Council who justifies the removal of crucifixes in a furniture van, that the minds of the children in communal schools may not be prejudiced in favour of Catholicism, is still somewhat of a rare bird in France, and it is well not to dispose of him too hastily. M. Hérold seems to have pushed M. Ferry's policy a little further than M. Ferry himself, and M. Hérold's subordinates have gone a little further than M. Hérold. But, considering how near the Christmas holidays were, and that, if the removal of the crucifixes had been postponed till then, no one but the officials would have been present at the operation, and consequently no needless offence would have been given, it is difficult to believe that M. Hérold was greatly shocked at the too iconoclastic zeal of his agents. If he could not wait a fortnight before stripping the Paris schools of their religious emblems, he must have been remarkably eager to set about the work; and eagerness to pull down is seldom found compatible with much show of respect to the thing pulled down. The removal of the crucifixes was probably kept quite as a holiday among the Communists and quasi-Communists of Paris, and the Prefect of the Seine would doubtless have been unfeignedly sorry to have deprived a class with which his official relations are necessarily a little strained of one of the few pleasures it is in his power to give them. The furniture van which carried away the crucifixes was probably followed by a rejoicing rabble who felt that at last there was some reason to hope that the long-expected destruction of religion was about to be accomplished. It is pleasant, of course, for a ruler to be able to give enjoyment to his subjects; but it is possible that in this case M. Hérold has shown a too exclusive regard for one section of his subjects. When 85 Senators are all that can be found to support the Government on a critical division, it is plain that there must be great searchings of heart among the moderate Republicans. There has been no instance of such a division since the last senatorial elections. It is not to be expected that the Government will be in any way deterred from the course which it has marked out for itself by any uneasiness on the part of its more moderate supporters. M. Gambetta has declared to win with the advanced, not with the moderate, Left, and the politicians who represent him in the various departments cannot take a different line from their chief. But these first symptoms of Republican disaffection are worth a passing notice.

THE GOVERNMENT AND THE ANARCHISTS.

It is not surprising that the most instructive speeches on the state of Ireland should have been delivered by Irishmen. It is natural that English members of the Opposition should expatiate on the inexhaustible topic of Ministerial incapacity or complicity. They can scarcely exaggerate the misgovernment which they denounce, but the severest strictures proceed from those who are more intimately familiar with the causes and details of the progress of anarchy. Even Mr. Stansfeld, who, as a zealous supporter of the Government and an ardent Liberal, said as much as possible on the comparatively irrelevant subject of land tenure, while he passed lightly over the abdication of the constitutional authorities, was enabled, in consequence of a recent visit to Ireland on the business of Lord Beaconsfield's Land Commission, to throw some light on the rapid advance of moral and social deterioration. Early in October he heard of no Irish demand for any larger concession than "the "three F's," which were condemned a few years ago by Lord Hartington and Mr. Gladstone. Five weeks later the Land League had taught the peasantry to insist at first on fixing the amount of their own rent, and ultimately on depriving the landlords of their undisputed property. Mr. Stansfeld faintly admits the necessity of coercion; but he seems scarcely to recognize the proof which he has himself given that the most urgent need of Ireland is the protection of life and property, and not the readjustment of the relations of landlords and tenants. The question is better understood by loyal Irishmen, among whom two members of Parliament, both formerly Law Officers of the Crown, have eminently distinguished themselves. Mr. Gibson has both in and out of Parliament taken a principal part in the vindication of law and justice. Mr. Plunket lately delivered at Chesterfield an admirable speech on the causes of the present disturbance, and on the grossly neglected duties of the Government. He had spent a considerable part of the autumn in the most disturbed part of Connaught, near the scene of the murder of Lord Mountmorres, and the farm lately occupied by Captain Boycott. Mr. Plunket confirms the statement, which has more than once been made, that the social rebellion was organized, and in the first instance conducted, by a few men unconnected with the land, who assembled the meetings and procured agents who perpetrated murders and other outrages. Two prominent agitators had been Fenian convicts, and one of them might probably, without any change in the law, have been arrested for violation of the conditions of his ticket-of-leave. It cannot be doubted that the names of the ringleaders were known to the Government; and if due powers had been obtained from

Parliament, they might have been placed in confinement before their machinations had produced any formidable result. Mr. STANSFELD's five weeks' experience is fully explained by the immunity deliberately conceded to the conspirators by the Government.

Mr. SHAW-LEFEVRE, speaking about the same time, quoted with approval the statement of Mr. GIBSON, that the absence of outrage was only a proof that in certain districts the power of the Land League was fully established. As an expert in agrarian projects, Mr. SHAW-LEFEVRE dwelt at length on the alleged expediency of encouraging the system of ownership by occupiers; but he distinctly stated, and it must be supposed on official authority, that the first measure submitted by the Government to Parliament would be a Bill for restoring order. "Every one," he said, "must admit "that the time had come for some exceptional treatment "of the question." As Mr. PLUNKET conclusively showed, the time for legislation came three months ago. The evil is now incomparably greater, and the remedy will be more difficult and less effective; but as late as November the two Birmingham members of the Cabinet laid down "the sage "maxim," as Mr. PLUNKET calls it, that force is no remedy for lawlessness. The impending Coercion Bill will involve a confession that there has been unwarrantable delay. It will appear that, in spite of Mr. CHAMBERLAIN and Mr. BRIGHT, force is deemed a remedy for lawlessness; but some Ministers thought that the maintenance of their own consistency was a more important object than the protection of the peaceable community; and they perhaps also thought that the Land Bill would be made more comprehensive or more revolutionary by the prolongation of the reign of terror. Mr. GLADSTONE's determining motive has probably been his pronounced determination to introduce a Land Bill simultaneously with a measure of coercion. It has been truly said that the project involves the theory of selling justice; but there are still more conclusive objections to wanton connivance with cruel oppression. Any land law which can be devised will necessarily be tentative and doubtful in result; and, if Mr. GLADSTONE agrees with his apologists that the Act of 1870 has proved a failure, he can scarcely demand implicit confidence in his latest contrivance. Mr. PLUNKET has not facilitated his task by giving renewed publicity to the vigorous language in which Lord HARTINGTON and the present ATTORNEY-GENERAL for IRELAND declared their invincible repugnance to the scheme which the Government will now probably recommend to Parliament. It is of course possible that altered circumstances may justify or cause a change of policy; but retractations necessarily compromise the authority of legislators; and it is not well that the urgent and almost unquestioned need of a Coercion Bill should be placed on the same footing with the doubtful expediency of fixity of tenure. English Conservatives will do well to observe the caution with which Mr. PLUNKET spoke of the proposals which may be submitted to Parliament. He had no hesitation in condemning the past and present conduct of the Government, but on possible modifications of land tenure he expressed no opinion.

Lord RANDOLPH CHURCHILL has done good service to his party by removing a doubt which had been entertained, whether Lord BEACONSFIELD's Government, if it had remained in office, would have asked for a prolongation of the Peace Preservation Act. It appears from Lord RANDOLPH CHURCHILL's statement that Mr. FORSTER must have found in his office the draft of a renewed Act, and also the opinions of nearly all the permanent officials that the measure was necessary. Some of them thought, probably with justice, that the mild form of coercion which had lately been in force was insufficient for its purpose. The new Government overruled the judgment of its most competent advisers on the grounds stated in Mr. GLADSTONE's speech on the 31st of March. It was then his pleasure to assert that Ireland was more peaceable and contented than at any former time; and he even forgot that he was by implication attributing no inconsiderable merit to the Government which in an administration of six years had produced results so admirable. Liberal speakers are in the habit of taunting Lord BEACONSFIELD's Government with disregard of the feelings of Irishmen; but it appears that that long-suffering community, if it had been habitually affronted, was unconscious of the wrong. Mr. STANSFELD, with a certain candour, declared that the causes of Irish discontent were more remote than any political action of either party. The proposition may be true of the *causa causans*, or original reasons of discontent; but the *causa sine qua non*, the condition which has rendered the present state of Ireland intolerable, is the acquiescence of the Government in the foolish and frivolous maxim that force is no remedy for lawlessness. If Lord RANDOLPH CHURCHILL should have been misinformed, the Ministry will have the opportunity of proving that their predecessors, in the height of Mr. GLADSTONE's millennium, committed the error of trusting in the continuance of the existing tranquillity. It is impossible to say that, if they had been in power when the Land League began its noxious agitation, they would have been guilty of criminal neglect.

It is a comparatively trifling evil that foreigners should take the opportunity of inflicting gratuitous insults on England. The opinion which the Americans have formed of the Government which negotiated the Treaty of Washington is illustrated by the motion which a member of the Foreign Affairs Committee has submitted to the House of Representatives. After reciting with offensive accuracy the apparent inability of HER MAJESTY's Government to afford protection to life and property, the member for Louisiana proposes that the SECRETARY of STATE should recommend the adoption of measures for the pacification of Ireland. It is in vain that the *Alabama* claims were referred under humiliating conditions to a tribunal which cannot be mentioned with respect. Since the date of the arbitration Mr. GLADSTONE in one of his publications thought fit to assert that commercial supremacy was about to pass from England to the United States, and that he for one did not regret the reduction of his own country to a secondary rank. Officious efforts at conciliation are perhaps justly rewarded by contempt; but it may be proper to protest against voluntary acquiescence in an ill-bred reproof. If Congress adopts the motion, and if the PRESIDENT and the SECRETARY of STATE think fit to transmit the message, it may be hoped that even Mr. GLADSTONE's Government will know how to give a dignified answer; yet it is to be regretted, not so much that such things should be rudely said, as that they should be undeniably true. No man who respects himself would wantonly criticize the disorders of his neighbour's household; but the evils which he observes may nevertheless be patent and notorious. American politeness will not even permit the humblest domestic operations to be performed in secret.

M. GAMBETTA'S SPEECHES.

THE first volume has just been published of the collected speeches of M. GAMBETTA, and many will turn to it hoping to find in its pages some clue to the secret of the author's fame. Most people know vaguely that M. GAMBETTA is, and has for some time been, the most powerful man in France. And not only is he for the moment the most powerful man in France, but his power is of a unique kind. He makes and unmakes Ministries; he gives the keynote to the speeches of those who lead the reigning party; and it may even be said that France waits to know what she wishes and thinks until M. GAMBETTA has told her. How does it happen that M. GAMBETTA has this power? What has he done or said more than other men so that he should stand on a pinnacle above every one? He was an eager member of the Parliamentary Opposition for some months before the Empire fell; then he was a member of the Government of National Defence; then he escaped from Paris in a balloon, and was the head and soul of the movement of despair in which regiment after regiment of raw recruits was hurled against the disciplined ranks of the conquerors. When fighting had at last to cease, M. GAMBETTA would not own that it could ever cease, and had to be superseded by M. JULES SIMON. M. THIERS set him down as a mere *fou furieux*, and it seemed as if his game, brilliant as it had been, was played out. But soon he somehow made a position for himself in the National Assembly, which was on the whole very ill-disposed towards him. There was a feeling, which his enemies disclaimed sharing, but did share, that, somehow, amid a thousand blunders, with no kind of show of [illegible] ity, he still had been the one man who, above all others, had given expression to the voice of France that she would not lightly accept her shame, and that she would fight madly rather than not fight at all. M. GAMBETTA spoke in the Assembly [illegible] [illegible] always [illegible]; and he spoke outside the Assembly to such purpose and with [illegible]

EVERY year must bring with it much that is unexpected; but at the beginning of this year it was out of the region, not only of expectation, but of dreams, that at its end Mr. Gladstone would be Prime Minister, that he would have been for months Prime Minister with an overwhelming majority, and that he would be engaged in a most serious and hitherto unsuccessful conflict with Irish anarchy. When Parliament was opened in February, it seemed that it had a quiet life before it, and would be chiefly occupied with measures of legal reform, very useful but not very exciting. Mr. Cross provoked hostile criticism by his Water Bill; but he had no reason to suppose that the chief reason for the failure of his Bill would be that he would not be in office to support it. The elections, moreover, of Liverpool and Southwark filled the Conservative leaders with the erroneous notion that the country was in so propitious a mood that it would be a mistake not to take advantage of the preponderance of a deep and sound Conservative feeling. Lord Beaconsfield was so entirely off his guard that he announced the dissolution in a manifesto marked with many blunders of taste and style; but, even if the dissolution had been delayed, and if Lord Beaconsfield had remembered that it was the English people to whom he was appealing, there was evidently an irresistible tide of Liberal opinion running through the country, which would have made a Conservative defeat inevitable. Success begets success, and the Liberals won many seats because they had won others; but there can be no doubt that a large majority of electors meant to put Lord Beaconsfield out of office and to put Mr. Gladstone in. The new Parliament consisted of, in round numbers, 350 Liberals, 240 Conservatives, and 60 Home Rulers; and Mr. Gladstone, who was at once seen to be the only possible Prime Minister, formed a Cabinet strong in ability, the most striking features of which were that Mr. Chamberlain was added to Mr. Bright as a representative of the Radical wing, and that Mr. Forster chose the comparatively humble post of Irish Secretary. All the Ministers were re-elected without opposition except Sir William Harcourt, and he soon found an asylum at Derby.

The Session began, and had it not been for the Budget, in which Mr. Gladstone showed his unrivalled financial ability, and got the hardly treated payers of Income-tax to pay on behalf of the nation the cost of changing the duty on malt into a duty on beer, the first part of the Session would have been altogether disappointing and not very creditable to the Ministry. Incident after incident showed how thin is the ice on which even the most triumphant of politicians tread. There was the Bradlaugh incident, and a very disagreeable incident it was. Mr. Bradlaugh, on the express ground that he did not believe in the sanction of an oath, asked to be allowed to affirm. A Committee decided that he could not affirm. He then asked to be allowed to take the oath. Another Committee decided that he could not take the oath. Then the House, in opposition to Mr. Gladstone, who was left in a minority of 35, came to the distinct resolution that he should be allowed neither to affirm nor to take the oath. Mr. Bradlaugh made his way into the House, and as Mr. Gladstone divested himself of all responsibility, Sir Stafford Northcote had to move that Mr. Bradlaugh should be removed in custody, and the next day that he should be discharged. Then, in order to avoid further scandal and close the controversy, Mr. Gladstone got a resolution passed that any member might affirm in lieu of taking the oath; and as this was made retrospective, Mr. Bradlaugh was allowed to creep in, the House leaving it to the Law Courts to decide whether he had crept in legally. Then there was the Challemel-Lacour incident. Mr. O'Donnell persisted, in spite of warning and strong marks of disapprobation, in making an elaborate attack on a Foreign Ambassador. The Speaker put it to the House whether such a scandal should go on, but stated that he could not pronounce Mr. O'Donnell to be technically out of order. Mr. Gladstone rose, and, reviving an obsolete weapon in the Parliamentary armoury—a weapon so unused that, if ever used, it had not been used for two and a half centuries—moved that Mr. O'Donnell be no longer heard. The remedy was worse than the disease, for, if any member might move that any other member be no longer heard, debate would be at an end. A compromise was effected, and no more was heard of Mr. Gladstone's device; but the new Parliament viewed with dismay the spectacle of its leader coming forward with a sudden and strange proposal of which he had evidently not considered the consequences. Lastly came the Irish Disturbance Bill, which was nothing but a freak of rash philanthropy. The Government from the outset showed that it did not know what it wished to propose, or why it proposed it. Mr. Forster had very properly said that the Government would not make any proposal with regard to Irish Land until it had time to consider the question; and yet the Ministry chose to raise by a side wind, and, as a matter of no importance, a question that was intimately connected with the greatest difficulties of the Land question. He got his Bill through the Commons by a majority small beside that which it was supposed Mr. Gladstone could command. But in the Lords more Liberal peers voted against it than voted for it, and the overwhelming majority of Conservatives was not needed, although it helped, to reject the Bill. All these things had brought Parliament to the time when it is ordinarily prorogued; but the Ministry was determined that the Session should not end until it could show a record of hard work to the credit of a powerful and earnest Government. The Burials Bill was passed, the Hares and Rabbits Bill was passed, and the Employers' Liability Bill was passed, b[illegible] some useful minor measures. The House of Lords made some changes of a trifling kind in the Ministerial measures; but, on the whole, it showed itself sincerely anxious not to refuse the measures of a Liberal Government on account of the source from which they came, or the time or mode in which they were presented. Some ill feeling towards the Lords had been betrayed by those who were enthusiastic for the Irish Disturbance Bill, and Mr. Forster had not sufficiently guarded himself against what seemed to be very indiscreet language; but, now that the Session is a thing of the past, it may safely be said that the Ministry did, after all, get through a great deal of work; that the Lords did not treat the Ministry badly; and that both Houses bore, with considerable good temper, the stress of a Session prolonged much beyond the usual limits.

The Session was not marked by any very serious amount of obstruction. The Irish party received with disdain the well-meant measures for the relief of distress adopted by the successive Governments. Mr. Parnell looked very coldly on the Disturbance Bill, although he did not exactly oppose it, as he preferred, to use his own language, to leave the Lords to do his dirty work for him; and, on the vote for the Irish Constabulary, the national taste for an unprofitable squabble received the gratification of keeping the House sitting for twenty-two hours. But Mr. Parnell and his followers did not throw any life or force into their opposition in Parliament to the English Government. They were, in fact, occupied with a very different range of thought. They hoped to bring about a state of things in which they themselves would be the real rulers of Ireland. The project would have seemed to be a mere boast or whim of fools or dreamers, only that it happens to have succeeded. At the close of this year the larger part of Ireland is not under the rule of the nominal Government. It is under the undisputed sway of another Government, which has not so much rebelled against the nominal Government as superseded it. The movement which has in the end produced this wonderful result began last year, and was not originally started by Mr. Parnell or by any of the leaders of the Parliamentary Home Rule party. But in June of last year Mr. Parnell gave in his adhesion to it, and thenceforward placed himself at its head. The Land League was formed, and its main doctrines were formulated—namely, that tenants should pay no more rent than they could pay conveniently to themselves, and that those who opposed this view of things should be overborne by violence, or threats of violence, and by the terrible penalty of being shut out from every form of social intercourse with their neighbours. The new system was applied last year in Mayo, with some success, but not elsewhere, and nothing that has been said to the present hour can exceed the seditious violence of language used by the humbler leaders of the Land League last year. Some of them were arrested, but the Government was afraid to act firmly, and the prosecutions were dropped. In the winter Mr. Parnell went to the United States, where he tried to appeal, without any success, to the old American feeling of antagonism to England, but where he succeeded in obtaining some funds for carrying on the struggle. His appeal was so much mixed up with harrowing descriptions of Irish distress caused by two or three years of defective crops, that it was erroneously supposed in England that with the good harvest of the present year the whole movement would disappear. The present Government declined to continue the Peace Preservation Act, which the late Government would probably have continued. The ordinary law gives the powe[r] of quartering extra police at the expense of the district to which they are sent; but the Peace Preservation Act also stopped th[e] introduction of arms into proclaimed districts, and there can be no doubt that the wide diffusion of arms which has taken place since the Act expired has been a great stimulant to lawlessness. There were signs of increasing violence even while Parliament was sitting. Mr. Boyd was murdered; Mr. Dillon used language to an excited crowd which it seemed could have only the one meaning of an incitement to the most repulsive of all Irish crimes, the habit of maiming cattle. Lord Mountmorres was shot very soon after the Session was ended. It was obvious that the real issue was not what Parliament would say or do, but whether, when the good harvest had been gathered in, the tenants would or would not obey the dictates of those who told them to keep what they had got in their own pockets. If they would be firm and not pay, or would only pay something much less than they had bargained to pay, and would pay it not as being allowed a reduction, but as having fulfilled the whole of their duties, then they were promised not only the present gain of having a few more pounds in their pockets, but the enormous future gain of having no landlords at all. There can be no doubt that these wild promises produced a considerable effect; but the effect would have been passing and slight un[illegible] reign of terror had been established which first made it impo[illegible] for landlords to exercise their rights, and then made it imp[illegible] for tenants to pay who might honestly wish to pay. Th[illegible] thing was to paralyse the arm of the law, to reinstate[illegible] who ha[d] been evicted, to build houses for those whose [illegible] had been taken down so as to clear the holding, and to [illegible] and, if necessary, shoot process-servers. Then those wh[illegible] advantage of the law were to be personally terrified[illegible] tenant who had taken the holding of another was to be punished, himself carded, or his ears sliced, his cattle maimed, his hay destroyed. Lastly, those who could not be openly attacked were to be tabooed. No one was to speak to them, work for them, buy anything from them, or sell anything to

them. In a notorious instance Captain Boycott had been sentenced to this isolation, and was living in fear and misery, looking on at his valuable crops rotting in the ground. The heart of the men of the North was stirred, and they volunteered to go and do his harvest work. They went, and, under the protection of seven hundred soldiers, they cut and carried off his crops. But it was evident that this instance itself showed how impossible it was to cope in this way with the deadly invention of tabooing. The tabooers had triumphed, and by way of memorializing their triumph they no longer talked of tabooing, but of "Boycotting" their victims. It only remained to apply the process on a scale of increasing magnitude. The tenant who pays the rent due, the tenant who does not within a certain date join the League, the member of the League who does not pay up his fixed contribution, are "Boycotted." Even in the North the League begins to hold its own against the Government. Threatening letters, crimes of violence, outrages of all kinds abound, but not one in ten of the offenders is even sent to trial, men fear to sit on juries, solicitors may not give legal assistance unless permitted, the judgments of Courts cannot be executed. On the other hand, the Land League has set up courts of its own, where offenders appear, are indicted and tried, and receive sentences that are sure to be executed. All that has hitherto been done to combat this terrible and successful social revolution is to put Mr. Parnell and some of the leaders of the Land League on their trial. It will be interesting to know whether the offence of exhorting men to do acts which prostrate government and break up society is legally a crime, and whether an Irish jury will convict. But, as things now stand, it is impossible that a remedy so slow and gentle, even if applicable at all, can do much to put down the new Irish revolution; and the English public wait with anxiety and interest to know what are the more efficacious weapons on which the Government will now rely, and with which it has been so very tardy in arming itself.

The foreign policy of the new Government has consisted entirely in using the concert of Europe as a means of forcing Turkey to make such concessions and changes as the Powers think it necessary it should make. Relations of decent friendliness with Austria were restored after explanations had been exchanged as to the accusations made by Mr. Gladstone during the elections, and England then began to work with persistence, and, amid much discouragement and some success, the machinery of the European concert. A Conference met at Berlin and laid down a frontier for Greece. The Sultan was told to surrender Dulcigno to Montenegro, and when he shuffled and delayed there was a naval demonstration. The Sultan hardened his heart, and said that he should do as he pleased as to the demands of Europe; but that, in course of time, he would surrender Dulcigno provided the Powers sent away their ships and promised never to send them back again. England replied by organizing a plan for seizing on the customs of Smyrna. This so frightened the Sultan, or so frightened those who could frighten him, that he entirely changed round and said Dulcigno should be surrendered at once. It was surrendered, not at once, but at the end of two months, after various vexatious delays, but happily after only a very slight struggle between the Turks and the Albanians, whom the Turks showed they could overawe if they chose. Thus much the European concert has incontestably achieved, and the next thing it has to achieve, if it can, is the settlement of the Greek question. Here the difficulty of its operations is strikingly illustrated by the curious manner in which France has backed out of its special championship of Greece. It was France that proposed the frontier accepted at the Conference, and France only joined in the naval demonstration on the understanding that it was to be applied in favour of Greece as well as of Montenegro. King George made the round of Europe in the summer; and, though he was received well everywhere, he was received nowhere so well as in France, and by no one so well as by M. Gambetta. Later on there came over France a terror of being mixed up in unknown and incalculable difficulties if it meddled in the Greek business. The mission of General Thomassin, who was to aid in the organization of the Greek army, was suddenly stopped; and M. Barthélemy de St. Hilaire did everything in his power to mark his opinion that France had greater things to think of than its interests in the Levant. Meantime, Greece has been getting ready the biggest army it can collect, and a much bigger army than it can afford; and, although there has been a change of Ministry, there has been no change of policy; and King, Chamber, and people are all pledged to go to war in the spring, unless the European concert can be made to do its second piece of work, and make Turkey yield. Lord Granville and Sir Charles Dilke tell us that the European concert is as much of a reality as it ever was; and the opinion of the Bourses of Europe is evidently that the Greek question will be peaceably settled. Time, and not a very long time, will show what these assurances and opinions are worth. Sir Henry Layard, who ended his residence in Constantinople by a formal wholesale denunciation of the abuses of the Turkish Government, was temporarily replaced by Mr. Goschen, who has hard and unpleasant work, but who appears to be so well satisfied with what he has been able to do that he intends to return early in the year. In minor matters, however, the Powers seem unable to overcome the obstinacy of the Sultan; and their efforts have not succeeded in getting him to carry out the sentence of a court-martial on a fanatic who killed a Russian colonel in broad daylight, and who is spared nominally on the ground that he may possibly be insane, but really on the ground that a Caliph cannot admit that it is very wrong for a Mussulman to kill a Christian. In one part, however, of the Turkish Empire, where the Sultan has no authority, the concert of the Powers has produced the most salutary effects. The financial situation of Egypt has been finally cleared by the successful labours of the Commission of Liquidation, the representatives of the Powers are sitting to reform the Code, capital is attracted to the country, taxes are fairly levied, and at last it may be almost said that Egypt is happy.

At the beginning of the year General Roberts held Cabul after the dispersion of the tribes who had unsuccessfully attacked the cantonment of Sherpur; the leader of the tribes, Mahomed Jan, had fled with Musa Khan, the infant child of the late Ameer, to Ghazni; General Stewart held Candahar in security, keeping open his communications with Khelat-i-Ghilzai; and at Herat Ayoob was tossed about by the contending factions of the Heratis and Cabulis. During the winter months General Roberts strengthened his position at Cabul, where he appointed a native governor, and the English Government appears to have considered, but without any definite result, the advisableness of handing over Herat to Persia. In March it was announced that Abdurrahman, long a fugitive in Russian territory, had come to Balkh and had been well received there. In April Shere Ali was appointed Wali of Candahar, and Sir Donald Stewart set out to reduce Ghazni and join General Roberts at Cabul. Outside Ghazni he was encountered by a large Afghan force, which attacked him with the utmost determination, and it was only by the resolution of the General and the superior arms of the infantry that what was almost a defeat was converted into a victory. Ghazni was surrendered without a struggle and the road to Cabul lay open; but almost at the same time General Ross, who was marching to assist General Stewart, received a severe check, and the Kohistanees to the north of Cabul became so dangerous that General Roberts thought it prudent to give increased strength to his positions. For many weeks negotiations went on between the Indian Government and Abdurrahman, one chief point of difference being that the Government would not recognize Abdurrahman's claim to have Candahar handed over to him. At length all was arranged, and on July 22 he was formally recognized as Ameer at a durbar held near Cabul. Sir Donald Stewart, who took the command at Cabul, retired with the British forces under him, and left the city to its new ruler; but the startling events which had meanwhile taken place near Candahar called General Roberts with the flower of the Cabul army to retrieve the disaster of Maiwand, and to relieve the panic-stricken forces of General Primrose.

Ayoob Khan, having composed the differences which divided his followers, was known to be marching on Candahar, and the troops of the Wali, with a British force under General Burrows, were sent to meet him. The troops of the Wali mutinied, and, although the mutineers were to some extent punished by General Burrows, the greater part succeeded in joining Ayoob. It was uncertain whether Ayoob would attack Candahar or make direct for Cabul, and General Burrows received orders to intercept his advance in either direction. It was some time before General Burrows could learn where Ayoob was; but at length he received intelligence that Ayoob was at Maiwand. General Burrows set out in haste from his encampment at Kushk-i-Nakhud, and, on the 27th of July, found himself in face of the Afghan army. Without any endeavour to ascertain the strength of the enemy in men or artillery, General Burrows determined with his tiny force of a little over 2,000 men to attack. His mode of attack was to put his troops under the fire of the enemy's guns, and to wait to see what happened. For hours the cavalry as well as infantry were exposed to wholesale slaughter, and when a party of Afghans came up an unguarded ravine into the British centre, the native infantry gave way, the cavalry were already so crippled that they could not be got to charge, and a disastrous rout began. In spite of the heroism of the 66th, of the artillery, and of some native officers and soldiers, all that was left of the British army made in utter confusion for Candahar. They were not pursued, but many died of thirst and fatigue, and many were killed in the villages through which they passed. General Primrose, who was in command at Candahar, lost his nerve. He telegraphed that the force of General Burrows was annihilated, although half of the force succeeded in joining him; and he evacuated the city of Candahar and shut himself up in the citadel. During five weeks he was shut in a close prisoner, and could do nothing more than make one sortie, in which he sacrificed many valuable lives, without any apparent object, but which he said was intended to accustom his men to the idea that they really dare face the Afghans. General Phayre was sent to relieve him, with troops pushed rapidly through the Bolan Pass; but he was so seriously hampered by deficiencies of transport that he was anticipated by Sir Frederick Roberts. The feat by which this general relieved Candahar is one of the most brilliant in British military history. He gave up all reliance on a base of operations, set off with a force somewhat under ten thousand men, as it were in the air, and marched three hundred and eighteen miles in twenty-three days. Military critics in England loudly criticized the temerity of the undertaking, but the Government replied that they believed in their general, that the general believed in his troops, and that the country must wait to see what such a general with such troops could do. On August 31 Sir Frederick Roberts reached Candahar, and on September 1 he attacked Ayoob outside the walls. Everything was done that military art could do to insure success, and Ayoob was utterly defeated. An active

pursuit was judged to be impracticable or unwise, and Ayoob reached Herat, where he has since remained, but without appearing to have any authority, or power of gathering another force to attack Candahar. During the winter this town is to be strongly held, and the Government has not as yet announced its final intentions regarding it. The Wali has resigned his thankless office, and the great difficulty of abandoning Candahar, if it is to be abandoned, is to find any one in whose favour there may be a decent excuse for abandoning it. Cabul has been evacuated, there is no thought of having another British Resident, and even the passes leading to Cabul have been one after another given up. But it does not appear that Abdurrahman can do more than hold his own, and his authority, such as it is, does not certainly extend beyond Ghazni. In spite of the disaster of Maiwand and the panic of General Primrose, the general history of the year in Afghanistan has been in the highest degree creditable to the British army; but we are still far from the realization of the hope that when we leave Afghanistan we shall leave behind us a strong and a friendly Power.

In India Lord Lytton has been replaced by Lord Ripon, and although, when the appointment of Lord Ripon was first announced, there was some idle clamour against him on account of his religious belief, this soon died away, and a fair field lies before him, in which, when he is restored to health, as it may be trusted he soon will be, he may show what is in him. The extraordinary error into which the Indian Government had allowed itself to fall under Lord Lytton, as to the cost of the Afghan war, has thrown a shade over Lord Lytton's administration. Nothing can be said in defence of so deplorable a laxity of attention to the business part of the war; but the result of a very free criticism has been to show that the financial administration of India under Lord Lytton was successful, and that, in spite of the depreciation of silver, India was able to provide, without any apparent strain, large sums towards a most costly war. If England pays a share of the cost, it will be rather as an assertion of what is supposed to be a right general principle than a contribution to a poor and distressed nation. The real danger of India, that under our beneficent rule its population is growing much faster than its wealth, is a cause of future rather than of present embarrassment. The lessons of the Afghan war may be taken to have proved or confirmed the necessity of making considerable changes in the organization of the Indian army, and in time Lord Ripon may so far reverse the policy of his predecessor as to furnish the natives with repeating rifles to shoot snakes with, and to restore its freedom or its license to the vernacular press. But as yet no changes have been made, and everything in India seems to be fairly tranquil. There appeared at one time to be danger of an attack from Burmah; but, however mad or drunk King Theebaw may be, he is under sufficient restraint to abstain from courting certain destruction. In more distant parts of Asia there have been signs of trouble. The Russians, under General Skobeleff, the most brilliant Russian commander of the younger generation, have spent all the portion of the year which the inclemency of the climate makes available for operations in organizing an expedition so strong in artillery, so protected by forts, and so helped by railways and roads, that the power of the Tekke Turkomans will, it is expected, be finally broken. In Persia there has been an outbreak of the Kurds, who have poured in from Turkey to join their Persian kinsmen. As Persia was totally unprepared, the Kurds had at first considerable play for their inveterate propensity to murder and plunder. But they were defeated by a Persian force under Austrian officers, and, as Turkey has at last found the means of guarding her frontier, and as Russia has a force on her border ready to assist Persia if necessary, it is not probable that the Kurds will do much more harm. Whether a much larger and more formidable struggle is destined to disturb Asia is still uncertain. During the whole year negotiations have been dragging on between Russia and China. Russia has succeeded in obtaining the release of the Ambassador who was imprisoned on his return from St. Petersburg for having made a treaty which the Chinese Government repudiated. But whether the negotiations will end in peace or war will evidently depend on whether the Chinese can at the last moment screw up their courage to fight. Russia has accumulated an imposing force at Vladivistock, and for a time the war party in China overcame the party in favour of peace. But Colonel Gordon, who went out to India as Lord Ripon's Secretary, but immediately resigned when he found what being a Secretary meant, and who started suddenly for China, took the opportunity of his visit to undeceive the Chinese, so far as he could, as to the efficiency of their military and naval strength; and the recent order given by the Chinese Government for the construction in Germany of an ironclad, which must take some time to build, and which would be detained in case of war, points to the conclusion that China may nurse ambitious views for the future, but will give way for the present.

In the colonial world Victoria has attracted some little attention, for Mr. Berry has gone in and out of office in a mysterious manner; while the colony seems, on the whole, to have come to its senses, the constitutional contest having burnt itself out, and a compromise having established itself, which recognizes that the Council may interfere in financial matters, but ought to interfere seldom, and only on special occasions. Otherwise, South Africa alone has made itself conspicuous. The Government adopted towards Sir Bartle Frere the most unhappy course it could have chosen. It did not recall him; but it docked his salary, and left him to carry out the scheme of confederation if he could. The Cape Ministry raised a discussion on the subject, but found opinion so equally divided in Parliament that it abandoned for the moment any intention of proceeding with the scheme. Thereupon the Government informed Sir Bartle Frere that he was of no further use, and recalled him. The Cape Government itself made a gigantic blunder, which has latterly plunged the colony in bloodshed and confusion. Sir Garnet Wolseley, before he left, seemingly pacified the Transvaal—partly by arresting the ex-President, and partly by proclaiming that the annexation, once made, was irreversible; but he cast his eye over South African affairs generally, and uttered a solemn warning that, if the Cape Government persisted in its design of summarily disarming the natives within its borders, it would provoke a serious rebellion. The Cape Government would listen to no warning, and ordered the natives to give up their arms. Tribe after tribe refused, and a desultory struggle commenced, in which hitherto the natives have, on the whole, had the advantage. We hear of this native post being taken and that British post being relieved; but wherever the colonial forces may be the native forces close around them, and work done has to be done over again. The colonists, who went into their rash enterprise in defiance of the advice of the mother-country, have made most gallant efforts to show that they can rely entirely on themselves; and their forces, under the able leadership of Colonel Clarke, now amount to at least 12,000 men. But these forces are necessarily scattered, and the natives are not only numerous, but are so far formidable that they not only rush gallantly to die, but manage to carry off their dead. If the colonists are too hard pressed, or if the rebellion spreads beyond the Cape Colony, the mother-country will have to interfere, and Lord Kimberley has properly scouted beforehand the notion that England would ask as the price of aid the forfeiture of the Cape's Parliamentary independence. There is no objection in principle to a disarming Act. In the Crown colony of Natal there has been a disarming Act on the statute book for five years; but in Natal the Act has been wisely allowed to slumber. The blunder of the Cape was a blunder of policy only; and if it was guilty of this blunder in defiance of so high an authority as Sir Garnet Wolseley, it has at least done its best to redeem its blunder by the lavish expenditure of its blood and its money. The possibility that the Boers of the Transvaal may now make a serious effort to regain their independence adds a new and important difficulty to the many difficulties already threatening in South Africa.

In France the De Freycinet Ministry came into existence with the New Year. The Cabinet of M. Waddington had fallen because its leading members would not pledge themselves to the changes which its supporters demanded, more especially as to the amnesty of the Communists and the reform of the magistracy. M. de Freycinet brought General Farre, M. Cazot, and M. Magnin into his Cabinet —all men of pronounced views, and more or less associated with the Government of National Defence. General Farre succeeded in carrying a repeal of the Bill of 1874 providing the army with chaplains. But the Government did its utmost to preserve a character for moderation and peacefulness, and was greeted with a patronizing welcome on the part of Germany. M. de Freycinet in February procured the rejection of M. Louis Blanc's Bill for a plenary amnesty, on the ground that the concession asked for must be given by a Government that had shown itself to be strong, and could not be accorded by a new Government that would have the appearance of having had its hands forced. A difficulty presented itself in the case of the Russian Hartmann, who was accused of having attempted to assassinate the Czar, and whose extradition the Russian Government demanded. The French Government at length took refuge in the plea that the evidence furnished was not sufficient, and sent Hartmann over to England, the Russian Government marking its displeasure by ordering Prince Orloff to quit Paris for a time. In March the long looked-for struggle in the Senate over the Seventh Clause of M. Ferry's Education Bill began. By this clause non-authorized religious orders were forbidden to take part in French education; and, when the Senate rejected the clause, the Ministry replied by announcing that it would put in force the existing laws against these orders. The Jesuits were expelled from their residences, force being used where they resisted, and those who were foreigners were made to leave France. But the members of other orders were not touched, the Government hoping that they would be induced to ask for authorization. M. Léon Say was named as Ambassador at London, but soon left to become President of the Senate, and his influence was looked on to give strength to the Government, and to increase its character for moderation. It was in some ways inclined to tread so closely in the familiar paths of French Governments that, in a Bill for regulating public meetings, it inserted a clause permitting an agent of the Government to disperse them. As the Chamber showed an unwillingness to adopt this clause, M. Gambetta suggested that it should be referred back to the Committee, so as to save the Government from a defeat. This was accepted by M. Lepère, the Minister of the Interior; but M. de Freycinet stated that he should have persisted, and M. Lepère resigned, to be replaced by M. Constans. There was only a shade of difference, but the difference was in the direction of more pronounced opinions. The Government decided to keep the anniversary of the taking of the Bastille as a great Republican *fête*, and as a prelude announced that it was now strong enough to accord a complete amnesty, and got a Bill passed by both Chambers granting an amnesty to all whom the Government might pardon before a given date. The *fête* came off with great brilliancy and success; and in the August

elections for the Councils-General the tide of Republican feeling ran so high that nearly half of those who favoured monarchical opinions lost their seats. The decaying strength of the monarchical parties was further marked by the contemptuous tolerance extended by the Government to the Legitimists, who openly kept their King's birthday, and by the disruption of the Bonapartist party consequent on the approval bestowed by Prince Jerome on the March decrees. But the internal dissensions of the triumphant Republicans soon began to reveal themselves. M. Gambetta made a speech at Cherbourg in which he spoke of France being for the present content to keep intact what remained to her, but as relying on the working of inevitable justice in the future. M. de Freycinet made a counter speech at Montauban breathing of peace and nothing but peace. M. de Freycinet, when he found that the non-authorized orders would not apply for authorization, entered into negotiations with the Vatican, the basis of arrangement being that the highest authorities of the Church should repudiate any necessary connexion between religion and hostility to the Republic, and that the Government should allow the decrees to sleep until a judicial question as to their legality had been decided. M. Gambetta objected to this arrangement. His immediate friends in the Cabinet were instructed to resign; and M. de Freycinet, finding himself deserted, himself resigned, and was replaced by M. Jules Ferry.

The new Ministry seemed so completely the creation of the great and irresponsible wire-puller that it was treated from the outset with something like contempt, and, on the first day of the meeting of the Chamber, it was twice defeated, first on the question whether the conduct of General de Cissey, who had been removed from his command for using improper interference in private matters when he was Minister of War, and who was accused of worse things from which the judgment of a court of law has since cleared him, should form the subject of Parliamentary investigation; and, secondly, on the question whether a Bill dealing with primary education or one reforming the magistracy should come first. M. Ferry wished to resign; but there was a general feeling that the Republic was making itself ridiculous by these incessant changes of Ministry, and he was induced to remain, and the Chamber was induced to pass a vote of confidence in him. But the Chamber had its way. It insisted that a Parliamentary inquiry into General de Cissey's conduct should be made, and it insisted that before the Bill for giving a free and obligatory primary education was considered, a Bill should be passed by which for twelve months the Government should be at liberty to purge the magistracy of enemies of the Republic. Before the Chamber met, the Government had put the decrees of March in operation against several of the unauthorized orders, and a decision of the Tribunal of Conflicts pronounced that the laws against the orders, many of which were of remote date, were in force, and that the ordinary tribunals could not protect those who came under these laws from acts of the Administration. The Government was attacked violently in both Houses for what it had done, and M. Buffet was called to order in the Senate and M. Baudry d'Asson, after a scene most discreditable to him and his Legitimist friends, had to be removed by force from the Chamber. But the Government escaped anything like effective censure. It may be added that a Bill understood to be the creation of M. Gambetta has been introduced for conducting future elections by the *Scrutin de liste*, in order that the next Chamber may be more manageable, because less pervaded by the spirit of local independence. Outside the Chamber M. Rochefort has taken advantage of the amnesty to attack every one who has a shred of respectability; and inside the Chamber M. Clemenceau is succeeding in creating a party hostile to M. Gambetta as a timid opportunist. On the whole, France has in the year shown itself more and more Republican, while its Republicanism has become of a more pronounced and violent character; and the strength of the Republic seems to lie not so much in the wisdom with which its affairs are managed as in the utter discredit into which all the parties opposed to it have fallen.

The history of Germany still remains almost entirely the history of Prince Bismarck. He began the year by pointing out the permanent dangers to which Germany is exposed from Russia and France, and not only got the Army Bill renewed for seven years, but secured an increase which will, in time of war, amount to 60,000 men. He has renewed the Bill against the Socialists, and has placed Hamburg in a state of siege. Of course he has resigned, for he always resigns when he wants anything done quickly; and this time he resigned in order to mark his displeasure at the checks to which he was exposed on the part of the Representatives of the minor States in the Federal Council. They had refused to vote a tax on Post-Office remittances, which he supported. Their vanity must have been flattered by the discovery that the elaborate machinery of a resignation had to be put in operation in order to bring them to obedience, and now they are not likely to give him further trouble. At one moment he took it into his head that, if he could get power to put the Falk Laws in operation or not as he pleased, he might secure the support of the Central party by doling out favours in proportion to their obedience. The Parliament voted the Bill after cutting down some of its leading provisions, but the quarrel with the Vatican has not been appeased, the Centre has not been tamed, and the great national ceremony celebrating the completion of Cologne Cathedral was shorn of its intended splendour by the refusal of leading Catholics to take part in it. One measure which Prince Bismarck favoured, although he was probably not much interested in its success, the object of which was to create a German colony in the Samoan Islands, was rejected, and he has not as yet quite, although he has almost, succeeded in persuading Hamburg, Lübeck, and Bremen to acquiesce in the loss of their position as free ports. He has accepted the post of Prussian Minister of Commerce, and has announced that his object was to associate his name and influence with a grand scheme for the creation of an equivalent to the mediæval Guilds. With the discreditable outburst of hatred of the Jews which has lately disturbed the political and social life of Germany he has had nothing to do; but, on the other hand, he has not used his great authority to enforce toleration; and it must be owned that there is a fine flavour of autocracy and mediævalism about bullying the Jews which may have its sweetness for him. He has maintained his policy of cordiality with Austria, although the settlement of the tariff relations of the two nations seems as far off as ever. In Austria itself, although natural catastrophes like floods and earthquakes have caused alarm and distress, the year has been one of general prosperity. Some little progress has been made in settling the long-pending question of railways and tariffs with Servia, and that of the control of the navigation of the Danube. The pacification of Bosnia has been accomplished, and the only sign of apprehension has been the demand of the Government for money to fortify its Russian and its Italian frontiers. The Government of Count Taaffe, which is essentially a Government of compromise, has at least escaped destruction; and the Emperor has been heartily welcomed in his tour through Bohemia and Galicia. The standing feud, however, between the Autonomists and the Constitutionals; or, in other words, between those who dislike and those who desire the Germanization of the non-German provinces, grows, if anything, more intense. A monster meeting of Germanizers has been held at Vienna, and they have celebrated the centenary festival of Joseph II., not only as a quaint harbinger of reform, but as an exponent of the system of forcing German culture on barbarians. In Italy the Cairoli Ministry has held its ground, although incessantly threatened with combinations of the Right and the Extreme Left. It was forced to dissolve in the spring by the opposition of the Senate to the repeal of the Grist-tax, but secured a decent majority. The arrival of Garibaldi at Genoa, where his son-in-law had been imprisoned, and his presence at the ceremony held at Milan in honour of those who fell at Mentana, renewed the interest of Italians in their hero, but gave rise to no manifestations of opinion which could alarm the Government. The whole domestic and foreign policy of the Ministry was reviewed and severely criticized when the Chambers met in the autumn; and it was natural that vent should be given to the irritation with which Italians have had to endure the veto placed by France on Italian enterprise in Tunis; and every Government is easily exposed to the accusation that it has not done the right thing in the East. But the Government pleaded that it had done its best; it was not obvious that any successors that might be given it would do better; and the Ministry was left free to take up the momentous question with which it is now busying itself—the redemption of its paper currency.

The attempt in February to blow up with dynamite the Winter Palace of the Czar showed the persistency and the savage cruelty of the band that was determined to take the life of the sovereign. The Imperial family escaped, but several of the Finland Guards were sacrificed. The course taken by the Emperor after the attempt was to appoint a substitute, and to centre all authority in the hands of General Loris Melikoff. The scheme was successful. One attempt on Count Melikoff was made, but he himself seized the assassin, and by a mixture of moderation and firmness he restored safety and confidence in St. Petersburg, and set himself earnestly to inquire into the state of the rural districts, and to lessen the pressure of despotic authority. At a later period he exchanged his abnormal powers for the functions of the Minister of the Interior, but he retained that supremacy over the police which was his chief source of strength. He announced that greater latitude and efficiency would be given to local institutions, but made it quite clear that nothing like a Constitution for Russia could be considered possible; and although some relaxation of the laws on the press was promised, and one or two new papers actually appeared, the newspaper world was plainly informed by Count Melikoff that it must not think of straying beyond the bounds in which he might think proper to confine it. By the autumn he had been so successful in hunting up the band of conspirators and assassins who had spread a panic through Russia that he was able to bring them before a special military court at St. Petersburg. It then appeared that there had really been but a very few persons engaged in the worst of the plots, and among them there was a strangely large admixture of Jews and women. To the other calamities of Russia is unfortunately to be added a dearth which in many districts has reached the proportions of a famine, and to relieve the distress the duty on salt has been suddenly taken off; a measure wise in itself, but adding to the overwhelming difficulties of Russian finance. Of the minor countries of Europe which as usual pursue an uneventful, if happy, life, it is perhaps only necessary to notice Belgium, where the year has been signalized by the rupture of relations with the Vatican, on account of an alleged inconsistency between the Pope's pacific language to the Government and his exciting instructions to the bishops. But, if we wish to find a really striking contrast to the state of Russia, we have only to look to the Power that is so close a neighbour to her in the far East. In the United States there has been nothing to record but peace and prosperity, growing wealth, and growing numbers. General Garfield was easily elected by the Republican party to replace President Hayes,

after the dislike of the nation to a third term had shown itself to be strong enough to make the re-election of General Grant impossible. The disgraceful reign of Kelly in New York has been shaken, if not ended; and the Chinese difficulty has in one sense been made lighter by the Chinese Government having agreed to recognise that the general right of Chinese to enter and stay in the States shall be subject to such modifications as the local laws of each State may impose. The long-pending fishery question with England has perhaps been pushed one stage nearer to a settlement, as Lord Granville has expressed the willingness of England to pay an indemnity for the personal wrongs of the fishermen who were assaulted, although he firmly adheres to Lord Salisbury's main proposition, that local regulations made to protect the fisheries must apply to American as well as British subjects. Although no move has been made towards abandoning Protection, the national credit is now so high that it is thought possible to borrow money at three per cent.; and a golden vision of what will some day be the trade between the Old World and the New has been opened by the extraordinary energy and success with which M. de Lesseps has launched his gigantic project for cutting a canal through the Isthmus of Panama. No portion of the globe would benefit more by this canal, if it is ever really made, than the Western States of South America, and it is to be hoped that long before that time comes they will have settled down into something like tranquillity and an honest attention to business. The lingering war between Chili and Peru still goes on, and although Peru has had no successes to boast of, the mediation of the United States failed because Peru refused peace at the price of a cession of territory, and Chili is now girding herself up to making that grand attack on Lima by which she hopes to be able to dictate peace on her own terms. In the Argentine Confederation there was, on the occasion of a Presidential election, a struggle between Buenos Ayres and the inland States, which at one time seemed likely to have serious consequences, but which has ultimately settled into an arrangement which, it is said, ensures permanent peace. Everything no doubt is possible, even permanent peace in a Spanish Republic; and Mexico has got so far on the road towards this happy goal, that a Presidential election has passed by without any disturbance, and the people seem really inclined to welcome the visions of prosperity which the recent introduction of American capital waves before their eyes.

At home we have had a harvest not very splendid, but good after the wretched harvest of last year; a slow but steady revival of trade; and a rise in the price of safe investments, which at one time carried Consols above par. The Risca and Pen-y-craig Colliery explosions have again brought home the frightful dangers to which, in spite of all that science or care can do or have as yet done, our mining population is liable; and the accidents to the Flying Scotchman near Berwick and to the Midland train near Lancaster remind us that there is inevitable danger even on lines which are managed with the most zealous regard for the safety of the public. How men of long experience in taking charge of the lives of others make what seem unaccountable mistakes was curiously illustrated by the accident at Kibworth, where a driver of old standing and perfectly sober actually took his train for a mile or so backwards instead of forwards without being conscious of his mistake. The loss of the *Atalanta* training ship has never been exactly explained, but painful doubts were aroused as to her fitness for the purpose to which she was applied. For the greater part of the year a perplexing controversy has cast a shade over the management of one of our greatest hospitals, and the wide and serious question has been raised whether, under modern arrangements, nurses have not been invested with a degree of independence of doctors which makes it impossible for doctors to treat their hospital patients properly. Sir William Harcourt has signalized his tenure of office by instituting inquiries and ordering remissions of sentences, which, although at first causing some excitement, as he did not appear to be perfectly acquainted with the provisions of the existing law, have had the ultimate effect of guiding public opinion to the conclusion that indiscriminate imprisonment is not the proper punishment for young children. Mr. Fawcett has shown exceptional ability in the management of the Post Office, has imagined and carried out a new kind of thrift in the form of saving a shilling's worth of stamps, and has enabled very small investors to hold a share of the Public Debt. The disclosures of the Election Commissions have revealed how thoroughly corrupt, in spite (or perhaps to some extent in consequence) of the Ballot, English constituencies even of an important kind may be, what demoralizing waste and prodigality an election brings with it, and with what absolute indifference from a moral point of view corrupt practices are regarded, even by persons of the highest local respectability.

Church questions during the greater part of the year were happily quiescent. The first stone of a cathedral church of the first class was laid by the Heir-Apparent at Truro, for the use of the new Cornish diocese. By nominating an extreme party man to the new diocese of Liverpool Lord Beaconsfield irritated far more people than he pleased. Diocesan synods—an excellent, and even necessary, preparation for some sort of Church representation—have been held by several more bishops, and the Church Congress at Peterborough, under the vigorous Bishop of that see, was more than usually successful. But the year ends under much less hopeful circumstances. Two clerical victims of the persecution of the so-called Church Association have been committed to prison for disobeying the orders of a Court before which they would not even appear, because they denied it any spiritual jurisdiction. An appeal urged in their behalf before the Queen's Bench failed to effect their release. But the judgments of Lord Coleridge and his colleagues actually established the position for which Mr. Dale and Mr. Enraght were contending—namely, that Lord Penzance's claim to be Dean of Arches rested wholly on the Parliamentary authority of the Public Worship Regulation Act. Notice of further appeal has been given. Meanwhile a most serious controversy has sprung up as to the right of Parliament to legislate for anything beyond the temporal accidents of the Church without some previous consultation of the Church itself by representation. These internal dissensions, forced on by one intolerant party, and fomented, rather than allayed, by the short-sighted policy of the bishops, pave the way for Disestablishment, and must be hailed by the Liberationists with delight. On the whole, the working of that bungling piece of legislation, the Public Worship Regulation Act, has been conspicuously shown to be a failure; and the Ridsdale judgment of the Judicial Committee of the Privy Council, upon which all these ritual suits depend, is more and more discredited, as having been dictated by policy rather than by strict laws of legal interpretation, and founded upon an imperfect acquaintance with historical facts.

In the death-roll of the year the losses sustained by the Bench are by far the most conspicuous. Two chiefs of what used to be independent Courts died within a very short interval; Chief Baron Kelly leaving the memory of an excellent lawyer who rose through the usual party channels to high promotion, and Lord Chief Justice Cockburn the memory of a great judge, a great president of a tribunal, a great speaker, and a man of wonderfully varied knowledge and acquirements. The brilliant and promising career of Lord Justice Thesiger was cut short at the age of forty-two, after he had been three years a Judge of Appeal, and had begun to show how much there was in him to justify the extraordinary rapidity of his advancement. Sir William Erle had for some time retired from the Bench, and the sphere of Sir James Colvile's judicial labours was not one that attracted much public attention; but those acquainted with the history of the Bench know what admirable services each rendered in his day. The death of Lord Stratford de Redcliffe in the extreme days of an honoured old age recalled to men of this generation how great he had seemed to the generation of their fathers; and the deaths of Lord Hampton and Mr. Cave brought up the record of long and honourable, if not brilliant, political work. Dr. Kenealy ended a career which showed how a man may attain a notoriety very great and very unenviable, and then be utterly forgotten. Literature lost in Mr. Tom Taylor one of the brightest and most versatile of its representatives, and in Mr. Wills one of those valuable writers whose gift it is to work usefully with others. Dramatic art lost in Miss Neilson an artist charming, anxious at once to please and to soar high; and modern music of the lighter and gayer kind has lost in M. Offenbach one of its most prolific and popular masters. Mr. Frank Buckland has at least lived long enough to effect the great object of his life, and to bring his unrivalled knowledge of one branch of natural history to bear on the preservation of fish in our home-rivers. Abroad, two statesmen who in different ways and in different wars were once famous, Baron Ricasoli and M. Jules Favre, brought back to the recollection of their countrymen and the world the great days when Italy was made into a nation, and the sad days when France was trampled on by her conqueror. The Empress of Russia reached the end of a life which had borne witness to the amount of sorrow and suffering which there may be in an existence on which fortune seems to pour its foremost gifts; and very recently Mme. Thiers has followed to the grave the beloved husband whom she lost three years ago in the fulness of his powers, and whom for nearly half a century she tended with the devotion, not only of a wife, but of a worshipper.

CHRISTMAS CARDS FROM IRELAND.

THE invention of Christmas Cards has been vigorously taken up by not a few publishers of the United Kingdom, and, in this respect at least, it cannot be said that "no Irish need apply." But Messrs. Marcus Ward and Co., though they have this year quite maintained their old renown in the matter, cannot be said to have exhausted the possibilities which the greenest of islands offers to the inventive mind. A whole series of most effective devices, with equally effective legends, suggests itself to the student of contemporary events as capable of receiving appropriate embodiment at this extremely festive season. "Ils ne m'ont pas encore parlé," said Gavarni to the inquiring visitor in his studio who was puzzled by rows of lithographic stones ranged against the wall. The stones of Ireland are more eloquent; they speak to the deafest of ears. Mr. Plunket's speech at Chesterfield suggests a few dozen of such drawings; but we are afraid that the subjects might be dismissed as "sensational" by the robust moralists of our evening organs of Radicalism in England. Mr. Bence Jones has been prodigal of hints for the same purpose; but it has been already pointed out by one of our weekly contemporaries that Mr. Bence Jones, though "a man of great pith" a few days ago, has become a mere alarmist since he was himself subjected to what Mr. T. P. O'Connor has discovered to be "the grandest word ever added to the vocabulary of a people"—that is to say, Boycotting. Boycotting naturally suggests Captain

Boycott and some striking scenes at Lough Mask, but here again we are met by a redoubtable authority. Mr. Gladstone has found out that the complaint of Captain Boycott as to his exclusion from kirk and market is in the highest degree impudent, not to say preposterous. Nevertheless, in spite of these great authorities, we shall, after the custom of the ancients, persevere in our advice to a painter, or rather—as we have no fancy for what Mr. Allingham was once inspired to denominate in the case of one of Campbell's masterpieces, "a superabundance of blood in the picture"—we shall give a few hints for letterpress to accompany the delineations.

The form of diary has always been a favourite one for political comment on passing events, and the form of diary is peculiarly appropriate to the present subject. The Christmas Day of an Irish landlord, an Irish parish priest, an Irish tenant, an Irish tradesman, an Irish magistrate or judge in this present year of grace, offers surprising capabilities. As thus of the landlord:—"Rose at seven; found a grave dug at my front door as a symbol of peace and goodwill. Breakfasted, interrupted only by one shot, which smashed the window and upset the coffee-pot. Having been warned by the police that they could not be answerable for my safety if I went to church, decided not to go; but, before the time, news came that the sacred building had been gutted the night before, and the clergyman had been met on the highway and upset into a ditch. He is an old man, and his constitution must be rather shaken by this; but it is generally believed that he was mistaken for me, and a handsome apology is expected from the local leaders of the Land League. To employ the morning, walked into the paddock, where I found the two horses recently turned out to grass houghed; and, in a meadow near, my best cow prostrate on the ground. Examined her, and discovered a stick covered with nails in her inside. On returning to the house, was fired at twice; but these fellows are not good marksmen. The post came in, and I had half a dozen letters from my tenants saying that they were very sorry, but to pay rent was as much as their lives were worth. At the same time received lawyer's letter from the dealer who had supplied meal and seed potatoes for relief last winter, for which, having had no rents, I gave my bill at twelve months. He begins proceedings immediately. At dinner-time the cook (an Englishwoman who has not been frightened away) remarked that all the turkeys had been poisoned, and that the grocer refused to supply necessaries for the pudding." Then we might have the parish priest:—"Rose early, and, to avoid observation (though in truth this is an idle form), visited Thady O'Callaghan. Pointed out to him that, if he did not wish to be damned, he had better not pay his rent. Service. Preached a sermon (I hope of a sufficient strength) on the text 'Owe no man anything,' pointing out that, if it was wrong to owe, paying must be doubly wrong; for, if there was no need to pay, there could be no such thing as owing. Called in to Bridget O'Rourke, accidentally hurt by the patriots, who were justly indignant at her brother's conduct, and had wounded her in the breast with a pike. Comforted her as best I could, but hinted how much more fortunate was the lot of those who died in defence of their country. Remembered that I had been used to dine with ———, and that he gave me a very good dinner; but, as he is not likely to have any dinner to-day except what he cooks himself, forgave him for not asking me. Went to a Land League meeting in the afternoon, and forgot to point out that Queen Victoria's dominions were almost the only country in Europe where the true Church is wholly unmolested. In the press of business, allowance must be made for accidental omissions. Heard some shots as I went home; they were probably in celebration of the day." Or, again, let us take the Land League Committee-man:—"Went, after breakfast, to Dennis Hoggarty's, and took him a volume of the History of England turned down at the reign of Edward II. Pointed out that the best way of retaliating on the tyrants was to serve their cattle as they had themselves served their King. Read the *Freeman's Journal*, and went to the meeting. Expatiated on the grandeur of the verb 'to Boycott'; but deprecated threatening letters. (N.B. Had received one or two myself, with Northern postmarks; and, though they are probably sent by our own fellows, think it a dangerous thing.) So-and-So called in, and told me that Lord ——— had been shot. A most valuable example. The English papers will make a fuss, but it will do wonders for Griffith's valuation, and the Government won't dare move. Dinner and bed. That scoundrel ——— hasn't sent in the whisky, pretending that I have not yet paid my last Christmas bill. Must have him Boycotted." Yet, again, let us take the shopkeeper:—"Colonel ——— has written ordering groceries; but I have received a letter from the Land League threatening to Boycott me if I supply him. He is my best customer, and indeed advanced me considerable sums to set me up in business when I married, but it will never do to be Boycotted. Besides, luckily, he is my landlord, and the League promises houses as well as land free. Macdermott called and paid me the fifteen per cent. on his loan; luckily the League have not interfered with that sort of thing yet. Like to see them do it." These artless tales, for which, it need hardly be said, chapter and verse can be supplied from Ireland in any quantities, all offer the finest opportunities (save perhaps the last) to the illustrator. There is, however, one more to be noticed which also speaks more forcibly by the aid of the pen than of the pencil. The scene this time is wholly historical. It is laid in the city of Cork. The chief actor is Mr. Justice Fitzgerald. A culprit is brought up on the charge of posting placards threatening magistrates for the performance of lawful acts. The evidence is as clear as daylight, and the jury disagree. They are sent back to no purpose, and the despairing Judge remarks that "with the present panel of the city of Cork it would be a solemn mockery to try the case again." Whether trying the case at all was not a solemn mockery is a point on which Themis gives no overt opinion.

We shall take the liberty to add to this list two more Christmas Cards of a very striking nature, which have been delivered not indeed from Ireland, but in reference to that pleasing country. One comes from America, and is directed to Downing Street; the other comes from Downing Street, and is directed to Captain Boycott. They are both of a character calculated to convey the most exquisite satisfaction to Englishmen. Whether the statement that a member of the Foreign Affairs Committee of the United States Congress is going to propose a Resolution regretting the state of lawlessness now existing in Ireland, and suggesting to Her Majesty's Government what it should do, be a fact or a clever hoax, the sting of it remains the same. The case is as Mr. King puts it, and no impertinence or want of *locus standi* on the part of the reductor can deprive the message redacted of its pertinence and relevancy. We, the Pharisaic people who thrust our maintenance of combined freedom and order in the face of the world, are at this moment displaying to that world the spectacle of a third of Her Majesty's home dominions in which freedom has become a thing non-existent, and order has given way to a dance of all the fiends—to use a phrase used once upon a time by a Liberal and something more in the days when Liberalism did not necessarily mean sympathy with murder and mutilation, with refusal to pay debts, and refusal to obey oaths solemnly sworn in a court of justice. More authentic perhaps, and more interesting certainly, is the Boycott-Gladstone correspondence already referred to. The letter to which Mr. Horace Seymour's signature is appended (we present to him our heartiest commiseration for the duties which occasionally weigh upon an amanuensis) is a Christmas Card of the most picturesque, and, at the same time, of the most historically valuable kind. A man who has been prevented by the *laches* of Mr. Gladstone's Government from carrying out his lawful business respectfully appeals to that Government for compensation. In reply he is snubbed and upbraided—upbraided for the trouble he has already given to the Government, snubbed for his preposterous demand on that Government. Not one single word of sympathy has Mr. Gladstone's large heart — that is the correct term, is it not?—for this Englishman, harried and ruined by lawless rebels. The heart, large as it is, is quite taken up by Montenegrins and Greeks, by Bulgarians and Thessalians, so that there is no room for the inhabitants of this petty little island, as the owner of the heart likes to consider and to call it. Captain Boycott is simply an impertinent intruder, whose existence has troubled and bothered the best of Governments. In all his long career Mr. Gladstone has never indited or dictated a letter so completely indicative of his own character as this. An unfortunate commentator, struggling with modern rationalism on the subject of the Prophet, the Children, and the Bears, once remarked that after all they were "only the children of unbelievers." This is the attitude of Mr. Gladstone to a T. Captain Boycott is only a troublesome person, only the agent of the father of a Tory member of Parliament, only a *trouble-fête*, who has brought to a practical test the noble language of eloquent Prime Ministers at Guildhall banquets. After this specimen, the sort of Christmas Card which Mr. Gladstone might charge his secretaries to write to Mr. Bence Jones is too awful to think of. A gentleman who has roughly remarked—a horrid faculty of invariably hitting the right nail on the head is probably the source of all Mr. Bence Jones's troubles with a nation which usually hits the wrong one—that the reason of his troubles is that "Government had it in its head that it was possible to get its projected measure of confiscation through Parliament by keeping the country in a disturbed state," must be to Mr. Gladstone a very incarnation of wickedness. Still we are satisfied with what we have got. The letter to Captain Boycott is a Christmas Card which cannot be too much studied by all who wish to appreciate the present Government and its chief. "Peace on earth"—that is to say, civil war in Ireland; "good will to men"—that is to say, ruin and death to landlords and everybody inconvenient here—is Mr. Gladstone's Christmas gospel of good tidings, his allocution *urbi et orbi*.

LEO XIII. AND THE EASTERN CHURCH.

THE Allocution delivered the other day by Leo XIII., on raising Mgr. Hassoun, Latin Patriarch of Constantinople, to the cardinalate, was an eminently characteristic one. The event was noteworthy, as well from the antecedents of the new Cardinal, as from his being the first Eastern prelate invested with the sacred purple for many centuries; and the Pope took both points in succession as the text of his discourse. This is not indeed by any means the first sign of interest his Holiness has shown in the condition of the Christian East since his accession to the Papal throne. The memorandum which he directed Cardinal Franchi, when Secretary of State, to address to the plenipotentiaries in Berlin on the position of Latin Christians in Turkey, his subsequent Encyclical on the Church in the Balkan peninsula, and the negotiations more

recently carried on between Cardinal Jacobini and the Austrian Government on the liberty of the Church in Bosnia and Herzegovina, are all examples of his desire to re-assert the influence of the Roman See over the Eastern Churches, and his belief that a great future lies before them. But in the elevation of Cardinal Hassoun to the Sacred College, he gave more distinct expression to this feeling both in act and word than on any previous occasion. We will speak first of the later and directly personal part of the Allocution, which deals with the special claims of the new Cardinal, and come afterwards to the wider question of the relations of the Eastern and Western Churches which forms its principal theme. In the panegyric pronounced on Mgr. Hassoun there is a curious, and evidently not undesigned, omission, which will at once strike every reader who is at all familiar with the circumstances and immediate results of the Vatican Council. We are told in glowing terms how those Armenians who of late—that is, in consequence of the Council—rebelled against the Apostolic See, afterwards repented and were by the mercy of God restored to their obedience, and how "in this great work of pacification, our venerable brother, Antony Hassoun, gave endless proof of sagacity, of zeal, and of prudence." A little sketch is added of his past career, informing us how, after completing his educational course in Rome he returned to the East, where he has passed forty years in discharging the duties of his ministry, and became first Archbishop and then Patriarch, and how, "when a most deplorable schism broke out among his people, he signalized himself for the forbearance and incomparable fortitude with which he defended the rights and maintained the teaching of the Church." Conspicuous indeed among his many virtues is "not merely the constant loyalty but the ardent love and singular devotion he nourishes towards this Apostolic See." And the Pope goes on to observe that he has therefore restored to the Eastern Churches in his person the honour of the Roman purple, of which they had been deprived "ever since the time of Bessarion."

This reference to Bessarion, the last Eastern Cardinal, is in one sense more appropriate than perhaps his Holiness intended it to be. The name will recall to those familiar with the history of the Council of Florence an analogy between the two cases which the wording of the Allocution would certainly not have led anybody to suspect. All the praises bestowed so lavishly on Cardinal Hassoun may from a Roman point of view be well deserved, but the Pope omits to mention that his signal services in bringing back the revolted Armenians to their obedience were all the more warmly welcomed at Rome because he had himself, in spite of the "constant loyalty" ascribed to him, been the leader of their revolt after the Vatican Council. "The courtly Bessarion," as Milman calls him, was not, indeed, exactly like Mgr. Hassoun, a returned prodigal, but he was an Eastern prelate who, to say the least, "might seem by his temper and moderation not to have been without some prophetic foresight of the Cardinalate and the quiet ease of a Western bishopric"; while he was regarded by such sturdy champions of the independent rights of the Eastern Church as Mark of Ephesus—if we may credit Syropulus—as little better than a traitor. Bessarion himself described Mark as "a man possessed with an evil spirit," and Mark in return denounced him as "a bastard and an apostate." It may be feared that the separated Greeks and Armenians, who have not yet been "reduced to obedience," entertain a not very dissimilar opinion of Cardinal Hassoun. His case so far recalls that of the late Bishop Haneberg, formerly Abbot of St. Boniface at Munich, and a close personal friend and ally of Dr. Döllinger's. Some years before the Vatican Council Pius IX., on account of his reputation for Liberal views, put a veto on his appointment to a Prussian see, and sent a message to him that he would never allow him to be made a bishop. When, however, after many heartsearchings and under strong pressure from his colleagues in the Benedictine Order, Haneberg had at last given in his tardy and reluctant adhesion to the Vatican decrees, the Pope was more than willing to sanction his appointment to the see of Spires, which he occupied for the last year or two of his life. We do not at all mean to imply that Haneberg's submission, unwilling and constrained as it notoriously was, had anything to do with the hope of a mitre—he was far too upright and unworldly a man for that—or that Leo XIII.'s Church policy runs in the same narrow grooves as that of his predecessor. He has no doubt done a wise thing, as well as achieved a clever stroke of policy, in raising Cardinal Hassoun, the returned renegade, to the purple, and the tone of this Allocution, no less than the general tenor of his public acts and utterances, indicates wider aims than the mere vulgar ambition of securing the devotion of an active and zealous proselyte. The new Cardinal is really, we believe, a man of some mark, and in praying that "the high dignity conferred on him may prove advantageous to the Catholic Church, and especially to the East," with the pointed reference to the last great attempt at reconciliation, at the Council of Florence, the Pope was evidently directing his thoughts beyond the mere handful of Uniates, or Christians in communion with Rome, scattered over the East. It might perhaps be objected by an unfriendly critic that "the honour of the Roman purple" is not likely to be very highly appreciated there. For, although the Suburbicarian Bishops of the third century have been not improperly called, by a kind of proleptic anachronism, "the initiatory College of Cardinals," that body cannot be said to have had any assured and substantive corporate existence before the famous decree by which Nicholas II. at the Lateran Synod of 1059 constituted it for all time, and to the exclusion of all other claimants lay or clerical, the supreme Electoral Council for supplying vacancies in the headship of the Church. And exactly four years before the Cardinals thus received what has been justly termed the Magna Charta of their Order, the Latin and Greek Churches had finally, and with many mutual anathemas, sealed their formal separation. But still it is only natural that any public attempt to reconcile the estranged communions should be signalized now, as at the ill-starred Council of Florence, by conferring on Eastern prelates the highest honours Rome has it in her power to bestow, though it is certainly not by the prospect of any such decorative trappings that the schism of a thousand years, touching as it does to the quick the very roots alike of national and religious life, is likely to be healed. And no one understands this better than Leo XIII., who would fain, if he knew how, recall the anathemas, bitterly conceived, and yet more bitterly resented, of his predecessor Leo IX.

And now let us turn to that wider aspect of the question with which the opening portion of the Allocution deals. The Pope first tells us how from the deplorable spectacle of religious conflict, iniquitous laws, and the progress of evil by which Christianity and the Church are everywhere assailed throughout Western Christendom, he turns for consolation to the Churches and peoples of the East, which have indeed ever since the beginning of his pontificate attracted his special interest, as well from their great necessities as because Divine Providence seemed to be inclining men's minds to submit to the centre of Catholic unity. What are the particular signs which at this time give his Holiness "reason to hope that the Orientals, touched by Divine grace, will at no distant day reconcile themselves to the Roman Church, from whose authority they long ago departed," he does not explain. But he proceeds in eloquent language—which in a man of his culture and character must be taken to intimate a genuine and generous appreciation of a mighty past—to dwell on the ancient glories of the Eastern Church:—

> So far as we are concerned, in truth nothing is sweeter than the recollection of the old glories and the incomparable merits claimed by the East. There, in fact, lay the cradle of human resurrection and the birth of Christendom; it was from those regions that, like unto a regal river, there were diffused in the West the inestimable treasures of the Gospel of Jesus Christ. Nor will it be possible ever to efface the renown of those illustrious of the East who, being led and inspired by the genius of Catholicism, were able to rise to greatness, and, thanks to their holiness, their doctrine, and the splendour of their enterprises, recommended to posterity the glory of their names; which things calling to mind, venerable brothers, we feel animated by the liveliest desire to engage with all our might in order to behold the East boast again the virtue and the greatness of old days.

Such language, true as it is to history, has not of late years been commonly heard from Roman, least of all from Papal, lips. That in the East must be sought the *incunabula* of Christian theology and of the Christian Church, and that thence it was diffused over the West, there can be no doubt. It is even remarkable that, with three or four exceptions only, all the recorded names of early Popes are Greek. And that for many centuries, during the period of all those Ecumenical Councils universally recognized as such, and the formation of the Creeds still received alike by East and West, the course of theological development was almost exclusively Eastern, is beyond dispute. Those opposite tendencies of the Eastern and Western minds which made ancient Greece the mistress of speculative philosophy and Rome the fountain of law, even for modern Europe, reappeared, as was only natural, in the history of the Church. Christian theology may be said to have taken its rise in the third century at Alexandria, and it was partly with the aid of Greek philosophy, partly in conflict with it, that the central doctrines of the Trinity and Incarnation which occupied the first six great Councils—all of them held in the East and composed almost entirely of Eastern bishops—were gradually evolved and fixed. The Latin Church during all those early centuries did little more, as Neander points out, than accept from the Eastern a dogmatic heritage to which she had contributed next to nothing of her own. But this speculative energy by slow degrees died out, and in practical power the West had always shown a decided superiority. "At the extinction of Paganism," it has been said, "Eastern Christianity had almost ceased to be aggressive or creative," and it was losing its internal coherence. The contrast of Eastern and Western monasticism aptly illustrates the leading distinction of Eastern and Latin Christianity. No two institutions of common name and type could well differ more widely than the busy life of a Benedictine Abbey of the sixth century differed from the peopled solitude of Mount Athos or the Egyptian Laura. If Western monasticism, as Milman puts it, "rent from the world the most powerful minds, it sent them back trained by its stern discipline to rule the world"; but the Eastern monks—except when they formed themselves into fierce political or polemical factions—scarcely exercised any influence on the general condition of society. And the estrangement of the Eastern Churches from the advancing civilization of Western Christendom inevitably served to deepen the stagnation of their intellectual and moral energies. It was not till the middle of the eleventh century that the separation can be considered as finally clenched by the excommunication laid by the legates of Leo IX. on the high altar of St. Sophia; and in the middle of the thirteenth "the [second] Council of Lyons witnessed," to cite Milman's words, "a reunion unhappily but of few years of the Church of Basil, the Gregories, and Chrysostom, with that of Leo and Gregory the Great." The next attempt, two centuries later

at Florence, proved a still more deplorable failure. The Greeks on both occasions were willing to admit in words a kind of vague supremacy, or primacy, in the Pope, but were jealous of their national independence. And with a shadowy supremacy the Popes were not willing to be content. It was here, rather than in the controversies on the *Filioque* and the one or two other doctrinal points about which Latin and Greek theologians sometimes profess to differ fundamentally, but do not, when so disposed, find it very difficult to agree, that the original quarrel took its rise, and the insistence on this obnoxious claim has hitherto rendered abortive every fresh attempt at reconciliation. If Leo XIII. really desires to see the Eastern Churches, in union with the West, "boast again the virtues and the greatness of old days," he will do well first carefully to inquire what amount of "obedience to Roman authority" was required of them in those ancient and more peaceful times before the publication of the Isidorian Decretals and the age of Hildebrand.

MR. KEENE'S DRAWINGS.

MR. DU MAURIER named his collected sketches pictures of "English Society." Mr. Keene has chosen to call his volume *Our People*, and the two names sufficiently mark the distinction between the work of the two artists. Mr. Du Maurier's favourite characters are aquiline duchesses, bearded and conceited musicians, distinguished foreigners, pretty women of fashion, pretty children, coarse *nouveaux riches*, parasites, and æsthetic foplings. His style is minutely finished; his figures, and the fashions that clothe them, are drawn with the delicacy and grace of Gravelot. Mr. Keene's favourite subjects are members of the middle and lower classes. He delights in the humours of drunken men, and can indicate with amusing certainty the exact stage of mental bewilderment and bodily incapacity in which his bemused people find themselves. The historian of the future, with Mr. Keene's book before him, will agree with the Home Secretary in holding that "Our People" were a very intoxicated people. Our servants, especially our gardeners and butlers, were only "shlightly shober," as Mr. Keene's English gardener says; "offen sober," as his Irish butler apologetically observes; and not at all ashamed of themselves like the Pharisaic, but hopelessly fuddled, Scotch gardener of another sketch. "Gentlemen," the grave researcher of the future will add, were not a whit more temperate in their tastes, and he will point triumphantly to Mr. Keene's design of a four-wheeled cab, crammed with chaotic shapes of men who live in different quarters, one of them in the "Halbany," and who have got so mixed that the cabman is unable to convey them to their separate homes. The excuses of drunkards and their bemuddled humour supply Mr. Keene with very many topics, and his appreciation of this sort of fun is probably akin to his love of Scotch wut.

"Our People" is used by Mr. Keene in its widest domestic sense. He is not an Imperial caricaturist (though perhaps there is room for such an artist), and he does not draw the humours of our Hindoo, Mahommedan, and African subjects, while he leaves the colonists to colonial draughtsmen. His range is confined to the three kingdoms—England, Ireland, and Scotland—and he shows wonderful discrimination in his caricatures of national foibles. His Irishmen are inspired by the Celtic indifference to the laws of man, of thought, and of the universe. An Irishman in politics, in philosophy, in common life, presents himself to Mr. Keene as an "unconditioned" kind of creature. He "does not feel the bonds of time, nor know the manacles of space." In his mind contradictory propositions repose together with perfect harmony, like the good and evil spirits who, according to Swedenborg, inhabit the heart of man, each unconscious of the other's existence. In the logic of the Irishman the general does not include the particular. As examples of those "Irish ideas," which make the country so difficult to govern, take the sketch named "Quite Another Thing." Two of the finest peasantry in the world are belabouring each other at a fair. They have quarrelled about a wager, and the loser refuses to pay, even at Griffith's valuation. Like other Irishmen, he has a capital reason for declining to fulfil a mere contract. "I said I'd lay you foive to wan, but I wasn't goin' to bet my halfcrown agin your tath'rin little sixpence!" This gentleman's mind accepted with readiness the general and abstract idea of five to one, but indignantly revolted from the baseness of supposing that the general and abstract "five" included the particular and concrete halfcrown. This ineradicable Irish logic is the core of Irish grievances, and no "remedial" plasters of legislation can heal it. On the same page the question of eviction is treated with a subtlety that will gratify Mr. Jacob Bright. That profound reasoner has just been cheered at Manchester for saying that the history of Ireland has long been sad, but that a great change has taken place. "The landlord no longer evicts the tenant, but the tenant evicts the landlord." And that is the policy Mr. Keene's drunken Paddy wished to attempt. "Turn me out," he yells to a barman; "is it turn me out? Thin, bedad, come outside, and turn me out!" The Irish tenants who refuse to pay their debts, and ask their landlords to "come outside," are, we trust, likely to fare, in the long run, as Mr. Keene's drunken kerne fares at the hands of his athletic barman. A hint on Irish policy is given by one of Mr. Keene's Irish cab-drivers. When the mare has jibbed for the fourth time in a mile, the "fare" threatens to get out. "Ah thin," whispers the driver, "never mind her! Sit still. Don't give her the satisfaction of thinking she has got rid on ye!" We cannot afford to let Mr. Parnell and Mr. McCarthy think they are to have the satisfaction of getting rid of us, let them jib as they will. The "unconditioned" Irish logic shows itself in the Irish waiter's answer to the tourist who wants to know when the first train leaves for Clonmel. "The noine train up used to leave at ha'f-past noine, but faix it goes at tin now, and there's no furrst train now at all, at all. But I'll ask at the bar, sorr." Mr. Keene has not illustrated the story of the Englishman who went to see an Irish friend, knocked at the street door, and asked, "Does Mr. M'Guire live here?" "He does, sorr, but he's dead!" "When did he die?" "If he'd lived till to-morrow, he'd have been dead a fortnight." Very appropriate is the sketch of the pretty colleen consoling a friend who has committed a "clean" crime; that is, shot an intrusive widow, from behind a wall, or filed off the legs of a horse obnoxious to the Land League. "Never fear, Pat," says Biddy, "sure ye're got an upright judge to try you." "Ah Biddy," replies this "wild but engaging personality," as Mr. Wedmore would call Pat, "the divel an upright judge I want! 'Tis wone that'll lane a little!" But really, with witnesses who dare not give evidence, and with frankly perjured juries, Patrick need not have troubled himself to do more than send his judge a blasphemous threatening letter. The peculiarities of the Irish are not very amiable at present; but Mr. Keene seems to think them, as Mr. Clough thought the Italians, "with all their faults, a nice and natural people." Mr. Keene, who, in many ways, continues the tradition of Leech, is not usually so successful in his landscapes as was that great artist. His best sketch of scenery is an Irish one, a view of the river behind the Distillery at Sligo. A small, dirty fisherman is wading, and a friend, also very dirty, hails him from the embankment. "Dominick, did you get e'er a bite at all?" "Sorra wan, Pat. Only wan small wan." "Lave it there, then, an' come home. Shure you'll get more than that in bed."

Leaving the most distressful and distressing portion of "Our People," let us see how Mr. Keene treats the dwellers north of the Tweed, who are often subjects of his pencil. He is fond of sketching examples of their well-known virtues—economy, caution, strength of will, self-esteem, piety, and argumentativeness. As to their piety, can there be a more touching instance than that of the shepherd who asks his friend to whistle to his dog? "I daurna mysel', it's fast-day in our parish." On fast-days the Scotch do not indeed abstain from meat, as Mr. Buckle supposed, still less from drink; but they engage in no secular pursuits. Mr. Keene's Presbyterian minister who tells a boy-angler that it is "wicked to catch fish on the Sawbath," is met by the crushing retort, "Wha's catching fesh?" Indeed the water in the drawing is unhopefully low and clear. The Celtic indifference to truth is indicated in a drawing of a salmon-fisher, busy in a most unpromising burn, very narrow, and overgrown with trees. "Deuced odd, Donald, I can't get a fish over seven pounds, when they say Major Grant, above us, killed half-a-dozen last week that turned twenty pound apiece." "Aweel, sir, it's no that mickle odds in the sawmon, but those fowk up the watter is bigger lears than we are down here." Mr. Keene, of course, has made use of the story of the "Peebles body" who had not been in London above two hours when "bang went saxpence." By way of a digression, we may remark that the tale about "Peebles, the place for pleesure," has been corrupted in the Southron version. The Peebles man is represented as saying that, despite the rival claims of Paris, "Peebles is the place for pleesure." On this statement it might seem that the child of Peebles preferred a contemplative and idyllic form of enjoyment, and liked to saunter by the Tweed better than to tread the noisy Parisian asphalte. But what the man really said was, "For real pleesure *and devilment* give me Peebles," thus showing that he loved violent and dissipated delights, which, in his opinion, the capital of pleasure could only offer in a secondary degree. As a shining combination of thrift and piety, Mr. Keene offers us the Greenock boatman who "canna break the Sawbath day for less than fifteen shillings." Much more characteristic is the economical drover who bargains with the clerk at the railway-station for a ticket to Falkirk. Five and ninepence is demanded. "A'll gie ye five shillings," says the economist, and when that offer is declined refuses to raise his bid above five shillings and threepence.

In his studies of English life Mr. Keene, as we have said, does his best to continue the manner of Leech. He shuns gilded saloons, though he does introduce one haughty maiden, who "only knows the county people, and weeds *them*." He is more at home in the bar-room, on the top of the omnibus, in the railway carriage, at the students' supper, with the boy who sweeps the crossing, with the cabman, and the "fat, foolish scullion." Many of these were favourite studies of Leech's. Like him, Mr. Keene occasionally draws the "languid swell" (old school), but we have observed no æsthetic Osric in his collection. He revels in the humours of the husband of the middle classes, that weary beast of burden, who is expected to carry huge parcels from the stores, and to make himself generally useful. Mr. Keene has also found a vein of humour in our modern educational system, and his little schoolboys, when asked, "Who signed 'Magna Charta,'" exclaim tearfully that "*they* didn't." Another theological critic, asked by a teacher (whom Mr. Keene calls "pretty") to define a miracle, replies, "Mother says if you dun't marry new parson, 'twull be a murracle." This young lady reminds us that Mr. Keene seldom draws pretty women; he leaves

that grace to Mr. Du Maurier. Probably the prettiest girl in this volume is the Irish girl whose "landskip" has been taken by a wandering artist, and is "wonderfully like." This young person might stand for "Peg of Limavaddy," and would move the heart even of the "coronetted ghouls" and "ferocious beasts," who were Irish landlords before the days of Mr. Parnell and Mr. Jacob Bright.

MR. FREDERIC HARRISON ON HISTORY.

MANY distinguished persons of the last two generations have intimated their opinion that the world is becoming very disagreeable. Lord Lansdowne's famous complaint that "everybody was bent on examining everybody else, and that for his part he felt sure of being plucked," expresses the general tenor of these bewailings excellently; while perhaps the other side of the matter has never been put better than in a pleasing French poem of M. Théodore de Banville's, the burden of which is, *Mais à présent c'est bien fini de rire*. But, at any rate, if the amusements of life are terribly cut down, and if such of them as are left are such as to render life rather less tolerable than it might otherwise be, it might have been supposed that such consolations as we could find in grave and studious occupations would be left to us. Art for art's sake, science for science's sake, and philosophy for the sake of philosophy were still left. Above all, there was the great domain of history which offered cunning easements to the disinherited. Never have historians been more industrious, and never have they been more audacious, than during the last fifty years. What with diligent searching of records and bold generalization in pursuance of the great idea of the philosophy of history, there was something in the dominions of the Historic Muse to satisfy everybody. She no longer confined herself to the great and terrible events of history; she came down into the streets and the houses (sometimes into very queer streets and very queer houses indeed), and busied herself with the doings of their occupants. Even frivolous persons, therefore, could delight themselves in her company; while on the other hand the eager mind, bent on large theories, found plenty to satisfy itself in demonstrations that the characters of Lucretia and Messalina had somehow or other got mixed by a base collusion between Livy and Tacitus, that the sole true patriots in English history were Gaveston, Empson, and Judge Jeffreys. There was plenty for everybody; and everybody, as he took the share which pleased him best, comforted himself with the thought that the proper study of mankind was man; that he was improving his mind as well as passing the time pleasantly; and, in short, that Clio was worth nearly as much as all her sisters put together, not merely for example of life and instruction of manners, but for the provision of amusement as well.

All this is over. The Positivist Church, or one of its very numerous sects, has evidently been fired by a new ambition to rival her elder sister, the Roman branch of the Church Catholic. It is a favourite idea of some persons—an idea which makes mere students of things mediæval rub their eyes a little, it is true—that the Catholic Church was the great killjoy of the Middle Ages. "It made a wilderness of the world," says a late writer, who is evidently quite convinced of the truth of his remarkable proposition. So the Church Positive has girded up her loins for this long time past to make a wilderness of the world of the nineteenth, or rather, as we are getting on, of the twentieth century. Each apostle, orthodox or heretical, takes a corner of the field to his own private share, and proceeds to devastate it; and to Mr. Frederic Harrison has fallen the district of history. On Saturday night last Mr. Harrison delivered a lecture at the Working Men's College, in Great Ormond Street, on the place of history in education. He began by some praises of the study in general, with which we certainly do not intend to quarrel. Of the fact that knowledge of the laws of human nature and of the course of man's past is the completion and essential object of a good education Mr. Harrison cannot possibly be more fully persuaded than we are; nor of the other fact, that historical study is one of the surest means to this desirable end. It is true that Mr. Harrison's examples of the importance of historical study from actual politics do not seem to us quite so happily chosen as they might have been. "What was it," said the lecturer, "that made the problem of Ireland so menacing and terrible?" This is one of those oratorical questions which are, to say the least, dangerous, for some working-man might have been rude enough to reply, "The recklessness of Mr. Gladstone's electioneering speeches, and the subservience and party spirit of his Government." However, nobody did this, and Mr. Harrison was able to set it down to "a habit of misunderstanding" which was historical. Then, again, he wanted to know "what made the condition of things in the East of Europe so full of horror and gloom?" And here, too, we can imagine an inopportune reply being returned. However, nobody will doubt that it is very desirable both in regard to Ireland and to Turkey that people should know history; and this, after all, was Mr. Harrison's point. So he got on swimmingly, and drew out a charming course of fireside historical reading for the working-men, in which they were to take four great periods—the Stationary Theocracies and the Græco-Roman world, and the Middle Ages and Modern History—and were to study the whole or portions of a few great contemporary authors, together with certain manuals and summaries, to show them the historical place of men and movements. This is very nice, and the working-men might certainly do a great deal worse. Herodotus and Froissart, Livy and Villehardouin, with scores of others whom it is not necessary to mention, make as pleasant and as instructive reading for both working-men and idlers as can well be picked out of the biggest library.

But Mr. Harrison's sting was in his tail. It is all very well for the working-man to read these great authors, but he is to read them in the sternest spirit of an expurgator or selector. Mr. Harrison tells him what to avoid. He is to avoid, it seems, "the dry-as-dust trivialities in Mr. Carlyle's *Frederick the Great*"—that is to say, the antiquities of the House of Hohenzollern, and the eccentricities of the Tabagie, and the unimproving details about Mollwitz and Kunersdorff and a hundred other fights, and the story of that innocent invader of Berlin whose money the police confiscated, and whom the King comforted in a manner at least friendly and liberal if not Imperial and *Arabian-Nights*-like. He is to avoid "the amusing scandal in Macaulay's *History of the Stuarts*"—that is to say, all that differentiates Macaulay's *History of England* (which we suppose Mr. Harrison means) from an inaccurate and one-sided party pamphlet. He is not to read "the piles of memoirs of the unmemorable"; so that Brantôme and Pepys and Walpole and Saint-Simon and a hundred more writers of the first merit and interest are cut off at a blow. "The lives of the supreme rascals, fops, and idiots in human story" are to be shut books to him. Now, as it is to be feared that a good many among the supreme as among the *infimes* (English has not, like French, had the good sense and logic to borrow this necessary correlative) persons in the world have answered to one or other of these three terms, the working-man's historic studies will have very considerable gaps in them. He is further to shun "tomes on the secret intrigues of ten years," and "memoirs of a distinguished and utterly useless family," and "gossip of courts, and curious episodes and plots and conspiracies, and diamond necklaces and men in iron masks, and dynastic wars and military histories and royal histories and Parliamentary histories."

When anybody has recovered breath after this enumeration, he may well say, "Bless thee, history, bless thee, thou art translated." What Mr. Harrison has left at all we require very much stronger spectacles than we care to put on to discover; what he has left that is of interest to any human soul we are afraid that no optician in the world could put us or anybody else in a position to see. A certain *caput mortuum* of statistics and theories and unsupported statements might possibly be discoverable, but most assuredly nothing else. We have heard, of course, this nonsense about kings and battles before. But the people who are most vigorous in the denunciation of kings and battles usually tell us to turn to things which are equally excluded by Mr. Harrison's index. Constitutional history is felled by one of his swashing blows, and what is called the history of the people by another. Everything that makes history alive, that gives it its personal and human interest, vanishes; and the oddest thing of all is that nothing can possibly be more inconsistent with Mr. Harrison's highly philosophical prologue than this highly unphilosophical epilogue of his. He had just told the obedient working-man, and had told him very sensibly, how important it was that an adequate comprehension should be obtained of what the past course of man's life has been. Now, however disgusting it may seem to Mr. Harrison that all these things which he taboos should ever have had an influence on the course of man's life, it is quite certain that they had such an influence, that the influence taken together was immense, and that it practically determined the course of man's life itself. We are wise, we have changed all that, and what somebody calls, in the delightful slang of the day, the "wise adult conscience" of the individual voter (when the individual voter is not too much engaged in voting by ballot for the side which bribed him last) determines the course of history. But this happy state of things was not always; it has been even in England but for a very short time, and there are still, sad to say, places and countries where it is not in existence. So that perhaps, on the whole, putting amusement entirely out of sight, the student of history, according to this latest view of it, is likely to get a remarkably false view of history after all. That, however, is a minor point. The pleasantest suggestion conveyed to the imagination by Mr. Harrison's cautious is the vision of a series of historical classics adjusted to the Positivist standard. It is woful to think of the dimensions to which some of the luckless authors mentioned above will be reduced. Herodotus will go into a shilling pamphlet, and many a book of Livy will have to join its lost companions. As to the poor mediæval historians, they may as well be struck out of the list *en bloc*, for, until the time of Comines at least, they have nothing to offer to Mr. Harrison's student. An awful man that student will be. "Take away this bauble!" will be his constant cry to abashed librarians who have brought him gossip, or curious episodes, or Royal histories or Parliamentary histories, or what not, instead of the thrice-bolted bran for which alone his soul craves. Only it may be delicately suggested to Mr. Harrison, Is there not some slight danger of disgusting the lambs of the flock? Might not a working-man suddenly confronted with the ideal history *sans* gossip, *sans* king, *sans* Parliaments, *sans* curious episodes, despair and give himself up to wretchlessness of most unclean reading in novels and poetry, and the other frivolities of so-called literature? There is but too much reason to fear that such might be the case. Mr. Harrison, indeed, tells us that he has been five-and-twenty years impressing on the working-man the importance of history, and of course it is possible that in that time he may have screwed him

up to the heroic height of discipline required. But we cannot but think it most aristocratic and anti-popular conduct. Mr. Harrison himself has read all the frivolous histories, no doubt; and also no doubt has enjoyed them. But now he grudges them to the working-man. The working-man learns French in Great Ormond Street, and doubtless will be able to reply *Pas si bête*. With Macaulay, Carlyle, Gibbon (for Gibbon must certainly go), Froissart, Livy, Herodotus, and all their likes cut off, and a beggarly assortment of Blue-books and histories of prices put in to fill up the vacancies, the future student of history, according to Mr. Harrison, seems to us even a more lamentable object than the man of the future in general did to Lord Lansdowne. For even in the most universal examination some candidates might, indeed must, get through. But in Mr. Harrison's proposed historical school the preparation for examination would be so terrible that most human beings would expire or go into a lunatic asylum before they had read their books.

THE GOVERNMENT AND THE TELEPHONE.

THERE is an air of historical anachronism in the juxtaposition of a question of Government monopoly and the latest development of electrical science. The first idea seems to pertain exclusively to the past, the second to the present and to the future. The subject of the recent suit of "The Attorney-General *v.* The Edison Telephone Company of London, Limited," was nothing less than the claim of a Government monopoly to prevent the utilization by a private corporation of the discovery that spoken language may be transmitted to a practically unlimited distance by means of electricity. True, the monopoly was not claimed on any exploded theory of the divine right of the Crown, it was not asserted by any court favourite as a royal grant; on the contrary, it was contended for practically on behalf of the public at large, of the revenue of the country rather than of the Sovereign; and the claim was based on divers Acts of Parliament and a money payment of some ten millions expended during the last twelve years on the purchase of then existing systems of telegraphs.

Legislation on the subject of telegraphs commences with the year 1863, when powers were conferred on Telegraph Companies similar to those enjoyed by railway and other Companies formed for the benefit of the public as well as of their promoters. The Act enabled the Companies to prosecute their undertakings in the face of private opposition by empowering them to take or utilize private property on making due compensation. It defines a telegraph as "a wire or wires used for the purpose of telegraphic communication, with any casing, coating, tube, or pipe enclosing the same, and any apparatus connected therewith for the purpose of telegraphic communication." Five years working of the private Companies showed the desirableness of bringing the whole telegraphic system of the country under State control; and by an Act of 1868 the Postmaster-General was empowered to acquire by purchase the "undertaking" of any Company, corporation, or person then engaged in the United Kingdom in transmitting, or authorized to transmit, messages by means of electric or other telegraphs or mechanical agencies; the "undertaking" of such Company, corporation, or person being defined to mean the whole of their or his "electric or other telegraphs, wires, posts, pipes, tubes, and other works, instruments, materials, lands, tenements, hereditaments," &c.

In the following year fresh powers were conferred on the Postmaster-General, enabling him to deal more arbitrarily with recalcitrant Companies or persons who were disinclined to part with their business; and the Act further provided that, from and after its passing, the Postmaster-General should have the exclusive right of transmitting public telegraphic messages within the United Kingdom, similar to that which he already possessed with regard to the carriage of letters, a penalty of 5*l.* being enforceable for every act of infringement. To this sweeping monopoly, however, certain exceptions were recognized, the most important among which were "messages sent under the leave and license of the Postmaster-General; telegrams in respect of which no charge is made, transmitted by a telegraph maintained or used solely for private use, and relating to the business or private affairs of the owner thereof"; and "telegrams transmitted by a telegraph maintained for the private use of a corporation, Company, or person, and in respect of which, or of the collection, receipt, and transmission or delivery of which, no money or valuable consideration shall be or promised to be made or given." By this Act also the term "telegraph" received, in addition to the meaning assigned to it by the Act of 1863, an interpretation including "any apparatus for transmitting messages or other communications by means of electric signals"; and the word "telegram," which first appears in this Act, is defined to mean "any message or communication transmitted or intended for transmission by a telegraph." In 1878 another Telegraph Act was passed for the better enabling the Postmaster-General to carry out his task of maintaining efficient telegraphic communication for the country; and the expression "telegraphic line" occurring therein is explained to mean "telegraph posts and any work within the meaning of the Telegraph Act 1863, and also any cables, apparatus, pneumatic, or other tube, pipe, or thing whatsoever, used for the purpose of transmitting telegraphic messages, or maintaining telegraphic communication." It might well be a question, however, as to whether this Act, passed *alio intuitu*, and after an interval of nearly ten years, could operate to enlarge the limits of the monopoly created by the Act of 1869, and the point was not pressed on the late trial. Into this Act the Postmaster-General sought to introduce a clause directly aimed at securing the monopoly in this country of telephonic communication, which was then just becoming known, by providing that "in the construction of the Telegraph Act 1869, the term telegraph shall, in addition to the meaning assigned to it by that Act, include any apparatus for transmitting messages or other communications with the aid of electricity, magnetism, or any other like agency." This clause, however, did not find favour in the eyes of Parliament, and was abandoned. This fact was adduced on behalf of the defendants at the trial, and the counsel for the Crown were reduced to averring that the clause was only designed *ex majore cautelâ*, the existing enactments being of themselves sufficient to include the instruments and processes in question.

Under these Acts successive Postmasters-General have acquired the interests of practically all Telegraph Companies in the United Kingdom, together with certain rights over the wires of the different railways, at the cost, as before stated, of over ten millions. The yearly revenue from the transmission of messages is stated to amount to about 1,250,000*l.*, of which about 200,000*l.* is clear profit. The defendant Company was constituted in 1879 for the purpose of working two patents of Mr. Edison's, the subjects of which are hereinafter described. The specifications relating to Mr. Edison's inventions are somewhat unfortunate in their language so far as the defendants' case is concerned, inasmuch as they use the terms "the acoustic or speaking telegraph," "an electric instrument actuated by sound," "a telegraph operated by sound," "an instrument for transmitting sounds by electricity," "a telegraph instrument or apparatus operated by sound," and so forth. Substantially, however, the question is not what the thing is called, but what it is.

Telephones have been constructed by various inventors, presenting certain distinctive characteristics, but their action is practically based on the same principle. The simplest form is thus described by Mr. Prescott, the latest writer on the subject:—

> It consists of a steel cylindrical magnet, about five inches long and three-eighths of an inch in diameter, encircled at one extremity by a short bobbin of wood or ebonite, on which is wound a quantity of very fine insulated copper wire. The magnet and coil are contained in a wooden cylindrical case. The two ends of the coil are soldered to thicker pieces of copper wire, which traverse the wooden envelope from one end to the other, and terminate in the binding screws at its extremity. Immediately in front of the magnet is a thin circular plate, which is kept in its place by being jammed between the main portion of the case and a wooden cap carrying the mouth or ear-trumpet. These two parts are screwed together. The latter is cut away at the centre, so as to expose a portion of the iron plate about half an inch in diameter.

The plate, being vibrated by the waves of sound produced by a voice projected into the trumpet, becomes magnetic by approach and retreat to and from the magnet, and thus engenders intermittent electro-magnetic currents in the coil of wire which are transmitted through connecting wires attached to the binding screws to the corresponding apparatus at the extremity of those wires. These currents produce precisely similar vibrations in the receiving diaphragm, and thus the words spoken at one end are reproduced at the other, and conversation may be carried on, each instrument being both a transmitter and receiver. This simple form of telephone has received marvellous development at the hands of Mr. Edison in the shape of the carbon telephone and the loud-speaking telephone, the subjects of the two patents acquired by the defendant Company, and used by them sometimes, if not always, in combination. With these instruments increased clearness and force of articulation is procured by the employment of a continuous battery current instead of the intermittent electro-magnetic current of the above-described original form of telephone. But, in either case, the voice alone is the direct origin of the communication. In the carbon telephone, each separate instrument of which, like the simple telephone, can be used interchangeably as a transmitting or receiving apparatus, the impact of the voice on a piece of carbon interposed in the electric current produces changes in the intensity of the current which are communicated to the corresponding instrument at the other end of the wire, and so reproduce the sounds. The loud-speaking telephone is a receiving instrument only, each pair thus requiring a pair of transmitting instruments. The transmitting instrument is the carbon telephone; the loud-speaking telephone is a complex and most beautiful piece of mechanism. Roughly speaking, it consists of a small chalk cylinder, mounted on a metallic axis, capable of being rotated by hand or clockwork, and kept continually moist by a wet roller. Against the circumference of this cylinder a spring presses a thin strip of metal having one of its ends attached to a mica disc. A small induction coil completes the apparatus. The current from the battery passes through the primary wire of the induction coil, through the carbon telephone at the same end, and then along the intervening wire to the transmitting apparatus at its other extremity, and through that to the other receiving apparatus, the circuit being completed in each case in the ground. In the receiving apparatus one end of the secondary wire of the induction coil is connected with the metal spindle of the chalk cylinder, the other with the strip of metal pressed against its circumference. When the instrument is at rest no impression is produced upon the chalk cylinder. But when a message is to be received the chalk cylinder is revolved in such a direction as by its friction against the strip of metal to draw the mica disc towards itself; the variations set up by the vibrations of the voice in the transmitting

instrument affect the current in the primary wire of the induction coil and produce corresponding inductive currents in the secondary wire. Each current produces at the point of contact of the cylinder and the metal strip chemical decomposition of the moistened chalk, the nature of which is as yet obscure: the amount of such decomposition being exactly proportionate to the strength and duration of the induced current. In the process of decomposition a gas or fluid is disengaged and acts as a lubricant in reducing the friction between the cylinder and the metal strip, which accordingly slips back owing to the tension of the mica plate, and is, so to speak, picked up again by the rotating cylinder, as soon as the induced current ceases and the friction becomes stronger again. The vibrations of the voice may thus be reproduced in the mica diaphragm with enhanced effect, and the result is clear and articulate speech. This somewhat lengthy description of the loud-speaking telephone as used by the Company appears necessary in order that the merits of the case may be appreciated, more especially as the account thereof given in the judgment of the Court is not strictly accurate, omitting as it does all mention of the induced current, a most important element in its working.

But to return to the origin of the strife. In September 1879 the defendants set up an office in the City and began to advertise their business. Besides offering to set up and lease private sets of telephonic apparatus, they enunciated a scheme to which the Postmaster-General takes special exception. This was what was designated the exchange system. Branch or district stations were established or projected, with one of which each subscriber was to be put in telephonic communication. A central station was also established with which each district station was connected. At each district and at the central station electric switches, or points like those employed at railway junctions, afforded means for connecting any two wires converging thither, and thus on notifying his desire to his branch station, any subscriber could be put in direct communication with any other subscriber either through a single district station, or through two district stations and the central one. When the intercommunication was concluded the wires could be disconnected again. As soon as this plan was developed, the Post Office authorities wrote to the defendant Company, intimating that the Postmaster-General was advised that the contemplated operations would constitute an infringement of his rights, and asking whether the Company intended to take out a licence. The Company, in reply, disputed the suggested infringement, assigning the "advice of eminent counsel" as their authority, and declined to avail themselves of the proffered licence, adopting as a second line of defence the exceptions specified in the Act of 1869. They permitted inspection of their premises and plant by the Government officials, who, on their side, when the action was, after some further correspondence, commenced, waived all claim to the penalties given by the Act of 1869, suing merely for a declaration of their rights, an injunction restraining the defendants from any further infringement, and an account and payment over of all moneys already received. The contest has thus been conducted with great urbanity on both sides, and the main points of issue may be briefly summarized thus:—

The Crown says, Any communication made by a wire and apparatus connected therewith through the medium of electricity, or even by electric apparatus without the intervention of wire, if such were possible, is the transmission of a telegram within the meaning of the Telegraph Acts 1863, 1868, and 1869; and by receiving money for such communications, either in the form of direct payment or of rent, you have infringed the Postmaster-General's monopoly, unless you can bring yourself within one of the specified exceptions. Your exchange system, at any rate, is outside those exceptions. The defendants say, In the first place a telephone is not a telegraph; true, it is a wire and apparatus connected therewith, and we utilize electricity, but it is not used for telegraphic communication, or for transmitting messages or other communications by means of electric signals. Telephones were not dreamt of at the time your Acts were passed, and you have not prophetically included them therein; that you know this is so is proved by your futile attempt to include them in the Act of 1878; next, we transmit no message or communication whatever; our instruments merely project the voice like a speaking-tube, and enable persons at a distance to carry on conversation with one another—where is the message, where are the electric signals? Even if we admit everything on these points, we are still within the exceptions. Our exchange system is nothing more than an aggregation of private wires; once communication established, the whole wire between the two subscribers is to all intents and purposes a private wire.

The arguments were very long and very learned, and many affidavits were read from scientific men, who, as scientific men are wont to do in courts of law, differed diametrically from one another, and a good deal of irrelevant matter was introduced touching the novelty of the invention which could not affect the question, inasmuch as no one can doubt that if Parliament chooses to confer a prospective monopoly, it can do so. Despite, however, the plausibility of some of the arguments on behalf of the defendants, Mr. Baron Pollock and Mr. Justice Stephen have given judgment for the Crown on all points. Summarizing fairly enough the extent of the Postmaster-General's monopoly, as deducible from the different Acts, to be "the exclusive privilege of transmitting messages or other communications by any wire and apparatus connected therewith used for telegraphic communication, or by any other apparatus for transmitting messages or other communications by means of electric signals," they proceeded to show how, in their opinion, the defendant's instruments and business fell within this exclusive privilege. In the first place they dispose of the argument that a telephone is not an apparatus for telegraphic communication. "The whole apparatus," say they, transmitter, wire, and receiver taken together, form "a wire used for the purpose of telegraphic communication, with apparatus connected therewith, for the purpose of telegraphic communication"; that is, they are a telegraph within the definition of the Act of 1863, which is embodied by reference in the Act of 1869. "The wire is a wire, the transmitting and receiving instruments are apparatus connected therewith for the purpose of conveying information by electricity, and this, as it seems to us, is telegraphic communication." They then proceed to justify by reference to dictionaries, and to the unfortunate words in Mr. Edison's specifications before referred to, the position that the word "telegraph" does not absolutely involve the necessity of any outward and visible sign at the receiving end. Its main idea is simply the speedy communication of information at a distance. Strictly, of course, a telegraph ought to write its information for itself, but though some telegraphs do so, it would be pedantry to deny the name to others that do not. Then, next, conversation by telephone is the transmission of a message, or at all events a communication. It is a communication, and when a man speaks it through a wire some miles long he sends what he says through the wire, or transmits it. Then, as to the exceptions, "the wires of the Company are neither owned nor maintained by the subscribers, nor are they used solely by the owners. The switchboard and the trunk-wires at the stations are the property of the defendant Company, and are essential to the system of communication adopted; while a charge, in the shape of rent, is made for the transmission of messages, and from this the Company derives a profit."

It was at once intimated, on behalf of the defendants, that they would appeal; and so the whole question will be fought again. The present judgment is, no doubt, strong in some points; but it does not strike us as inexpugnable. Put it as one will, it is hard to consider telephones as strictly *ejusdem generis* with telegraphs, or telegraph and telephone as interchangeable terms. The transmission of sound is an entirely new element in any electric communication. Sound may have been incidentally produced at the receiving end, but has never been transmitted before—certainly the voice never has; and the balance of scientific opinion seemed to point to its being perfectly correct in language to say that the voice, and nothing but the voice, was transmitted by the Company's apparatus, though the action of the induced current in the loud-speaking telephone seems to interpose an additional stage, as it were, between the words spoken and the words heard, which did not exist in the earlier forms of instrument. Then the question as to a message or communication being transmitted seems still quite arguable. It seems straining terms to say that conversation carried on at any distance is the transmission of anything, and on this, as on the former point, an Act which it is contended gives a prospective monopoly should be construed very strictly indeed. On the private wire question, the Court are probably right with respect to the exchange system. Certain passages in the judgment seem open to criticism as proceeding on what the Court conceived would be the absurd results of a decision in favour of the defendants. An invention like the telephone in its now perfected condition may well engraft ridiculous results on the arrangements and conditions of a less enlightened period, and the argument is one which has been applied to every great invention.

With the policy and probable effects of the judgment we have not here to do. From the Postmaster-General's announcement on Tuesday we gather that the immediate interests of the public are not likely to suffer; but how about the Company, how about the inventor, whose patents the Crown may assume and work without any compensation whatever, while the recent judgment enables the Postmaster-General to preclude him from deriving benefit from private enterprise? Above all, how about the future prospects of scientific invention and inventors in this country, if this is the encouragement they are to receive?

INVESTORS' GUARDIAN ANGELS.

IN spite of raids against betting-houses and other hindrances and discouragements, the passion for gambling is still rampant amongst us. The innocency of early boyhood is tainted, as of yore, with a wicked delight in pitch-and-toss; and the temptation to have a shy in a sweepstakes is sometimes too much even for the most discreet. In after life our more sobered taste may save us from the Scylla of horse-racing, but who amongst us is ever safe from the Charybdis of the Stock Exchange? Every man of spirit revolts against the tameness of a fixed return for his money; and there are persons who feel they might as well be on the treadmill as eke out a modest income derived from the Three per Cents., or be subjected to the galling prudence of trustees. Conscious of our weakness, a paternal Government has removed temptation as much as possible out of our way. Crockford's and other similar establishments are no more, and the police keep a watchful eye even on the copper ventures of boys in the gutter. Nothing, however, is so certain as that a demand creates a supply. Persons craving to gamble away their fortunes are provided, even in these respectable

days, with ample opportunities of doing so, without having recourse to the gaming-table method of other times. The most remote country parson and the most helpless of unprotected ladies have every possible convenience afforded them for casting their little properties into the lap of fortune. It is only necessary that their names should appear in some list of shareholders in order to secure a complete deluge of financial schemes, calculated to enrich them in the shortest possible time. With the morning paper and the morning roll will punctually arrive the morning prospectus. They will find that railways are running, or are about to run, in remote countries that *must* yield immense profits, and the golden opportunity of investing in which is known only to a favoured few. By the rarest good fortune the secret of their prosperity is not yet public, and the only thing is to secure the chance of investing at once before the inevitable rise in the shares takes place. If, however, there should happen to be a dearth of these remarkably profitable lines of rail, the intending investor need at least never be at a loss for a little venture in mines. Here he will have the advantage of a wide selection in the nature of his investment. Indeed, in mining concerns every variety of means of flinging away his money is provided for him. Though he may shrink from the trifling risk involved in the chance of realizing an immense fortune, he may yet feel disposed to seek what is termed "a steady investment" in some established undertaking, in which the shareholders are said to hold their money "only for investment," and in which, indeed, "there are usually more buyers than sellers" according to the prospectus; while, nevertheless, the future bids fair to be immensely profitable. Small capitalists, however prudent, can hardly be expected to be proof against the fascinations of a steady investment with a profitable future, more especially when a preponderance of buyers will always enable a shareholder to sell his shares. It would be culpable folly to rest content with mere railway debentures or real property at 4 per cent. when such chances are going in the market. The very abundance of the possibilities open to him, however, involves the investor in a difficulty. He is bewildered in making his selection, and he knows not of whom to seek discreet advice and assistance. The steady-going family man of business is, he feels, a shade too steady for his purpose, and would certainly deprecate anything in the least tainted with speculation. His views are narrowed to the consideration only of the most absolutely secure of investments, and he has no sympathy with dreams of a very profitable future. There are plenty of men no doubt in the City who would be ready enough to advise, but the amateur in speculation is quick to distrust the City, and feels that his guileless nature would be no match for the wiles of the Stock Exchange.

We cannot be too grateful that a distinct class of journal is now current, intended to meet precisely such cases as that we have described. There are, happily, philanthropic editors, who have made it their special province not only to shield their readers from the devices of unprincipled swindlers and promoters who would prey upon the simplicity of confiding capitalists, but even to guide them into the paths of fortune. Nothing can be more admirable than the disinterested way in which these financial journals exercise their almost parental function. They vie in numbers with the various schemes presented for the outlay of our capital, and appear as an antidote on our breakfast-table *pari passu* with the poison of the tempting prospectus. In an otherwise evil and grasping world it is reassuring to find that there are yet persons of sufficient integrity and public spirit to act as mothers to innocent investors. If wiles beset us in laying out our money, it is comforting to know that every effort is made to expose them. The function of these organs, however, is not limited to a mere croaking over improvident speculations. To deprecate all ventures would be idle. The foibles of human nature are too familiar to these editors to allow them to suppose such a thing possible. Their province is not to stem the tide, but to direct it. In one of these journals, for instance, selected haphazard, we find nearly three columns devoted to the recital of a series of maxims admirably adapted to the copybook of the sucking investor. If guileless readers of the "Mining Monograph" trip in their investments, it is certainly not for want of a warning voice. In that prudent sheet they may read under the heading "Saws" such sentences as the following:—"Obtain advice from an experienced and trustworthy broker BEFORE buying; don't place too many eggs in one basket. Secure a reasonable profit on your investment when it can be obtained; remember that LEAD mines are much less liable to sudden adverse fluctuations than those yielding either copper or tin." And further on, "Be cautious as to 'tips,' they are seldom disinterested. People do not give tips without having an ulterior motive; valuable information is seldom imparted gratis." "It is better to invest chiefly in mines worked under the Limited Liability Act, because when once the shares have been paid for, all further liability and anxiety are at an end." Nothing can be nicer than all this, and ordinarily grateful persons will hardly read these sage paragraphs without a sense of obligation to their framer. The thirst for gambling is not quenched, it is true, by their perusal; but a praiseworthy effort is made to temper our wilfulness with the wisdom of experience. Even if the rash desire to place too many eggs in one basket should be successfully stifled, it is yet felt that nothing would be nicer than to "secure a reasonable profit," if that may be done, and, with the most rigid determination to be proof against "tips," the ignorant investor is only too willing to accept "good advice." "Investors in mines," he is told, in the same paper, "should act systematically and with caution. A few simple rules should be observed, and profitable results are almost a certainty." The appetite must, indeed, be dead which is not whetted to master these "few simple rules," when profitable results are almost a certainty.

It is easy to understand how to a country clergyman, labouring to maintain a growing family on some few hundreds a year, such a paper as the "Mining Monograph" must come as a refreshing shower on a long-parched earth. His income is not elastic, and there is no way open to him of supplementing it by other labour of his own. His wife's forty pounds a year are doled out to the family through the cautious medium of three vigilant trustees, and his own modest fortune brings him a few hundreds from the Three per Cents. Hitherto he has been taught to regard all speculation as inevitable ruin, and the only venture he ever makes is to put a half-crown into the lottery for the embroidered banner-screen at the parochial fancy bazaar. When, however, the "Mining Monograph" is brought to his notice, he recognizes in it a guide, philosopher, and friend. The tone of the little journal is so temperate and prudent that it invites his confidence at once; whilst there is a dash of learning in its style which appeals to his dormant culture. "From the day," he reads, "when the Phœnicians came across the sea to get the metals from the rich mines of Wales and Cornwall, and even back to the time when Tubal Cain's hammer woke the echoes of the primeval forests, the value of the mineral products of the earth has been fully recognized." Under the guidance of such a mentor he cannot go far astray, and since ever so small a "profitable result" will be of importance to him, it is no wonder if he is tempted ere long to have a little flutter in the mining market, at all events in the "LEAD, that is less fluctuating than copper or tin." It appears from the "Mining Monograph" that "It should never be forgotten that there is a time to buy and a time to sell," and, further, that "Now (under proper advice) is the time to BUY." Aspiring speculators might perhaps be perplexed as to where to seek for "proper advice"; but the "Mining Monograph," aware of the existence of possible harpies who might trade upon the innocence of its readers, even goes so far as to show where proper advice may be obtained by those who really seek it. It appears that if these will only consult "us," all danger and difficulty will be avoided. If the mere perusal of the "Monograph" has brought hope and comfort to the struggling, how infinitely better will be a personal consultation with "us." Only then will they adequately realize the full extent of their folly in submitting to live on a small fixed income, when untold treasures were lying ready to their hand. The risks they had hitherto supposed to beset all ventures they now find ("under proper advice") to be absurdly over-rated. The subtle knavery which they had felt themselves unequal to cope with will have no chance under the all-protecting guidance of "us." The treasures of Aladdin's cave, meantime, are unfolded before their astonished eyes, and the cares of the butcher's book and of the children's boots dissolve like a mist. "The outlay upon Welsh lead mines" is found to be "insignificant as compared with the astounding profits they yield." "Shares in what are termed 'progressive mines'—*i.e.* properties which, although not arrived at the dividend-paying point yet, are 'progressing' towards it—can usually be bought (*under experienced guidance*) at a very moderate price, and they frequently double, treble, or even quadruple their value in a few months." Deeply grateful to the philanthropic "us," the confiding investor returns radiant to the rectory with a new bonnet for his wife, purchased in anticipation of the progressing dividend. A joyful experience treads swiftly on the heels of budding hope. The prudent speculator who has invested under "proper advice" is ere long gratified with a glowing report, and perhaps is enriched with an interim dividend. Things begin to look up at the rectory under the influence of such well-grounded promise. The girls all have new frocks, and another little sum is committed to the "experienced guidance." Perhaps the interim dividend is not followed by any further distribution of interest at the regular half-yearly meeting of the mine proprietors; but this temporary lapse appears from the report to be due to some quite unprecedented and purely temporary cause, and the directors confidently look for a division of immense profits ere long. Unfortunately, this temporary depression, however, has some effect on the price of the shares, and, for a time at all events, there is not found to be "a preponderance of buyers over sellers." Nor, indeed, though the shares have been paid for, can it be said that "all anxiety is at an end." A short interview with "us," however, no doubt dispels much of this anxiety, and it is remembered that the property is not supposed as yet to have arrived at the "dividend-paying stage," but only to be "progressing" towards it. By-and-by another report comes, confident as ever, that the concern is "going to pay," but giving no immediate prospect of dividend, and by degrees the pleasures of hope become to the doubting investor a tolerably familiar experience. Meantime, the wife and family, who are not buoyed up by the occasional reassuring words of "us," begin to have grave misgivings as to the prudence of the head of the family. The cost of constant journeyings to and from town on business begin to make a perceptible inroad on the little income, and as yet no solid return seems either to be realized or to be expected for the sums invested. The whole demeanour, meantime, of the rector changes, and his very conversation becomes imbued with strange terms. Even the building of the Dissenting meeting-house in the parish causes him no such concern as the mysterious announcement that "things are flat." As time goes on he becomes more than ever aware that "all anxiety is *not* at an end"; but he will be

fortunate at all events if his liability is limited to the extent of his holding. Large sums have no doubt been made in mines, and to men of capital they present a very legitimate field for enterprise. But the risks of loss are great, and to meet them larger resources are required than are usually at the disposal of venturous persons of modest means. Just as, however, there are always embarrassed young simpletons eager to avail themselves of the benevolent offers of assistance tendered to them by advertising money-lenders, so, we suppose, will weak-minded people always be found ready to believe that Golconda is open to them through the "experienced guidance" of "us."

YACHT-RACING.

At the conclusion of an article on Racing Yachts which appeared in the *Saturday Review* of November 13 last, we referred to certain disagreeable features of the season of 1880, in some respects so brilliant, and stated that we should speak of them on a future occasion. We now propose to deal with this unpleasant part of a pleasant subject. Unfortunately it cannot be ignored, as in the system now followed by several of the clubs which are supposed to be most anxious to encourage yacht-racing, that there are evils which, if allowed to continue and to increase, as evils are apt to do, may seriously injure, so far as large vessels are concerned, the one national sport in which even the sourest critics can find nothing to condemn. In spite of the great number of prizes which are offered, men will not go on spending huge sums of money in building and maintaining vessels for racing, if they find that palpable mistakes which occasionally endanger their craft are made, and that the views of those who know most about yacht-racing are steadily disregarded. It is not easy to suppose that owners will always be willing to risk yachts worth from eight to twelve thousand pounds in contests rendered dangerous by the neglect of obvious precautions, or will care to attend regattas governed by rules which the best authorities condemn. The totally unnecessary danger to which we allude is that caused by the careless manner in which the boats that mark the winning line, or the winning and starting line as the case may be, are sometimes placed. It seems incredible that there should be carelessness in such a matter, or that the persons chosen for the not very arduous task of mooring mark-boats should be so little competent as to disregard the most patent facts; but, unfortunately, carelessness and incompetence are occasionally shown, and the unfortunate yacht-owners have to bear the needless risk which is caused. Sometimes Sailing Committees will not even take the trouble to find men fit for work which ought not to present the slightest difficulty to any one with a moderate knowledge of seamanship. A singular instance of this kind of negligence occurred in one of the early matches of the season. In the race from Harwich to Southend the yachts had to finish across an imaginary line drawn from the end of Southend pier to a mark-boat moored south of it. The fleet consisted of thirteen vessels, and included such large craft as the *Australia*, the *Pantomime*, and the *Latona*. The ingenious person, however, who had to moor the mark-boat was either ignorant of the nature of the race, and thought that it was for little boats, or else made up his mind (if the expression may be allowed) that the wind would be fair, and that the yachts would come in one after the other, in a straight line. Accordingly, he moored the mark-boat near the pier. Unfortunately the wind, which is very unaccommodating, was foul for the latter part of the course on the day of the race, and the yachts had to tack round the mark-boat. In order to make sure of weathering it, the *Australia* was obliged to stand close inshore before going about, and scraped the ground heavily; and shortly afterwards, owing to the same cause, the *Pantomime* struck. The captains of the two schooners were not in the very least to blame for these mishaps, which were entirely due to the position of the mark-boat, which was much too near the pier. There was no conceivable reason against placing it further off; but the very simple and obvious precaution of giving sufficient room for large vessels was disregarded, and the accidents mentioned were the result.

It may seem almost incredible that there should be such carelessness, but unfortunately this case of magnificent recklessness about other people's property does not stand alone. At a later regatta the mark-boats were placed in the midst of a lot of shipping, and it was only owing to the remarkable skill shown by the captains that serious accidents were avoided. As it was, some damage was done. On another occasion the mark-boats were moored so near the shore that the large yachts were much hampered while inside the line before the start, and were in danger of getting aground or of fouling each other. Further instances could be given of carelessness which is absolutely without excuse. Some Committees appear to be under the impression that racing yachts are built, not only to sail, but also, like Dundee whalers, to be knocked about. A little of such instruction as any builder making out his trifling account for repairs could easily afford them would, we believe, convince them that this view is not altogether correct. Owing, however, to good fortune and to skill in handling, the serious accidents which might have been expected from the misplacing of mark-boats did not, except in the case which has been mentioned, occur. No skill in handling, however, could do away with the effect of bad management of races; and of bad management in several respects yacht-owners had last season some reason to complain. They were vexed by old grievances which seem now to be felt more strongly than ever. We do not wish to enter at length into the much-disputed question of flying starts as against anchor starts. It seems clear that those who are most interested in the matter and most competent to decide are in favour of flying starts. The recommendation of the Yacht Racing Association is clear enough on this point, and it is much to be regretted that leading clubs should set at naught the well-known wishes of racing yacht-owners. No doubt there are some objections to a flying start, and over-eagerness for the lead occasionally puts vessels in peril, as was made very manifest this year at Dover and Plymouth; but, on the whole, this method of beginning a race seems to be preferred by those best qualified to judge, and should be universally adopted. Besides the retention of this rule, there is another ancient grievance which seems likely to cause every year more and more annoyance. We refer to the rule—if such a happy-go-lucky method of settling matters can be called a rule—which governs some of the early contests. It is an old regulation, and is, like the old system of time allowance, as bad as anything can be. We refer, of course, to the rule according to which the rig of the first vessel in determines the rig of the winner. The evils of such a law seem obvious, and it is astonishing that Committees should persist in ignoring them. A very simple instance will show how badly it may work, and indeed must work. Let it be supposed that a yawl of 150 or 160 tons and a cutter of 80 or 90 come in close together, the yawl leading. With full allowance for the slight superiority of rig, it is abundantly clear, unless time allowance is altogether an absurdity, that the cutter has thoroughly defeated her antagonist. Nevertheless the yawl, if she has saved her time on the other yawls, takes the first prize, while the real victor only gets the second. Still stronger is the case if the yawl be closely followed by a schooner beneath her in tonnage. This would be a very remarkable success for the latter; but, under the present rule, she would, though of smaller size and inferior rig, receive no allowance from the other, and the vessel which had been in fact completely beaten would be the winner of the first prize. It seems strange that so barbarous a system should be adhered to, and stranger still when it is remembered that there is a method, happily followed at many regattas, of conducting mixed races which makes them perfectly fair. We need hardly say that we refer to the plan according to which schooners and yawls sail at the reduced tonnage as suggested by the Y.R.A., and the first vessel that passes the mark-boat within her time takes the first prize.

That the rules of the Y.R.A. are, though not free from faults, the best that now exist, scarcely admits of dispute. Some clubs still reject them altogether; and we shall presently show how far this rejection is justified by describing the manner in which the principal of these clubs conducts matches. A large number of clubs now accept the Y.R.A. rules; but, unfortunately, these, with the honourable exceptions of the Royal Cinque Ports, the Royal London, and one or two others, do not accept them in their entirety. Sailing Committees at various places insist on making little alterations and excisions. One rule of the Y.R.A. seems to be specially distasteful to them. This is No. 8, which declares that a yacht "duly entered may claim to sail over the course, and shall be entitled to the prize," subject to the power of the Committee to postpone the race if the weather be unfavourable. This regulation certainly seems fair enough. If a man brings his yacht to the starting-boats ready to do battle, and no one ventures to meet him, it seems only right that he should take the prize. This, however, is not the view of Committees, who, offering with one hand and taking back with the other, usually reject Rule 8, and refuse to allow a sail over. Frequently in matches for all rigs they enact that no second prize shall be given unless three or more vessels start, and no third prize unless five or more vessels start. Considering the enormous expense of racing vessels, and the trouble which has to be taken to bring them to the ports for the various regattas, this seems somewhat shabby; but such a rule, though rather suggestive of stinginess, is far better than that adopted this year by a considerable club, which, borrowing one of the most objectionable of the old regulations, laid down that no vessel which was the only one of her rig in the field should be allowed to start. A more unfair ordinance could hardly be devised, and it is scarcely necessary to point out how it may operate. When it is enforced, an owner, after giving himself considerable trouble and perhaps incurring some expense in order to reach a port, finds on the morning of the race that he cannot compete. It is much to be hoped that there will be no more borrowing of this singularly unjust rule from the codes of the ultra-conservative clubs.

How far those clubs are entitled to despise the excellent code and recommendations of the Y.R.A., and to treat with contempt the opinions of the great majority of racing yacht-owners, we now propose to show by giving the example alluded to above of the manner in which the principal of them conducts its matches. The Royal Yacht Squadron stands first on the yacht list, and, alone amongst all clubs, has the privilege of flying the white ensign. Its regatta is, as every one knows, more numerously attended and attracts more attention than any other. It might certainly be expected that the Cowes matches would be

well managed, and that all courtesy would be shown to the stranger yachts which came to take part in them. How far the Royal Yacht Squadron shows any courtesy, or shines as a host, may be gathered from what happened three seasons ago. On the morning of the day fixed for the schooner match of 1878 there was an absolute calm, and a strong westerly tide was running. At the time appointed for the start, three yachts belonging to the Squadron were in excellent berths close to the line, having been towed there by the club steamer, but other vessels were in what appeared hopeless positions. It might naturally have been expected that the beginning of the race would be postponed until all the yachts were towed up, but if any such expectations were entertained, they were certainly frustrated, for postponement there was none, and the starting-gun was fired at the hour named. This year the Royal Yacht Squadron seemed determined to show that their capacity for conducting matches was on a level with their genial hospitality. For the schooner match two cards were issued, one giving the course and the racing flags, the other the time allowances. In the first card the day of the race was stated as Friday, August 6, in the other as Friday, August 7, while in one the tonnage of the *Waterwitch*, which took the prize in the race, was given as 160, in the other as 157. The authorities of the Squadron could not apparently look at the almanac, or discover the tonnage of the yachts engaged in the race. It is not, therefore, to be wondered at that they could not calculate the time allowance right. They were apparently under the impression that the course round the Isle of Wight is about fifty miles long, and calculated the times accordingly. It need hardly be said that the course is considerably longer than this, and the time allowance was therefore far from being the true one; and as the yacht pronounced to be the winner only saved her time on a smaller vessel by a quarter of a minute or thereabouts, it seems clear that the prize was not awarded to the yacht which really won. Into this question, however, we do not desire to enter. Our object in referring to this marvellously ill-managed race has been to show how matches are conducted by a club which is far too proud to give any heed to the Y.R.A. It is much to be hoped that this sadly mistaken vanity will not long continue, and that those who have everything to learn will be willing to learn from those who are well able to teach. Other clubs which ignore the Y.R.A. may not stand quite so much in need of elementary instruction as the Squadron, but still they would do well to profit by the best regulations for yacht-racing which have yet been devised.

THE THEATRES.

MME. MODJESKA'S appearance at the Court Theatre in a versi

fortunately suffers from the facts that the version is very far from being a good one and that the principal actress is but indifferently supported. The play has in the original many marks of that curious playwright's instinct which Scribe possessed to an unusual degree, and which caused it to be said of him that, if he looked at a sunset effect, it would at once suggest to him the whole plot of a drama. Compression, which is no doubt from some points of view necessary, and want of skill, which is from every point of view unnecessary, have robbed the piece of much of its attraction in this kind; and, unfortunately, the players who fill the other parts, and most of whom have in other plays deserved and gained applause, seem curiously out of place. This is the more to be regretted since the authors of the play gave to each character an importance of its own. The play is in a sense a "star" play, as most good plays are—that is, it has a predominant part of so much importance that, if that part is ill performed, hardly any amount of excellence in the representation of the other parts can save the play from failure. This is the case with most of Shakspeare's acting plays, and yet there is no character in them which has not an individuality which ought to be seized and skilfully rendered by its exponent. The same thing may be observed—*magnis componere parva*—in almost all of the many pieces of many kinds which Scribe produced. It is a comparatively modern development of the playwright's art, or want of art, which has made it possible for a piece to depend absolutely and entirely upon the exertions of one performer, who is so constantly upon the stage that it matters little what is done, or how it is done, in the brief intervals of his or her absence. Much of the charm of *Adrienne Lecouvreur* depends upon the brilliant and natural writing of the scenes in which Adrienne herself does not appear, and, from the causes which we have indicated, this charm is wanting in the version of the play in which Mme. Modjeska appears.

The outlines of the piece are probably more or less familiar to most of our readers. It turns upon the love of Maurice de Saxe for Adrienne, who at first knows him only as an officer without fame or rank, whom she loves for himself alone. She has a terrible rival in the Princesse de Bouillon, a woman who stops at nothing to gain her own ends, and who finally poisons Adrienne by means of a bouquet, which is made to appear a present from Maurice de Saxe. This outline is filled in with a quantity of characteristic dialogue and of striking situations, among which the recital by Adrienne of some lines from Phèdre in the Princess's *salon* is perhaps the most striking, as well as the best known. The great actress has just discovered, in a way which illustrates curiously the artistic simplicity of Scribe's workmanship, that her rival is the Princesse de Bouillon, the woman whom she has just saved from a terrible scandal, and she selects for recital the lines ending

> . . . je sais ses perfidies,
> Œnone! . . . et ne suis point de ces femmes hardies
> [*Hors d'elle-même et s'avançant vers la princesse.*]
> Qui, goûtant dans le crime une honteuse paix,
> Ont su se faire un front qui ne rougit jamais!
> [*Elle a continué de s'avancer vers la princesse, qu'elle désigne du doigt, et reste quelque temps dans cette attitude, pendant que les dames et seigneurs, qui ont suivi tous ses mouvements, se lèvent comme effrayés de cette scène.*]

We have set out the stage directions as well as the text in the foregoing quotation for a simple and sufficient reason, which is, that Mme. Modjeska, like some other actresses who have played this part, has been blamed for not adopting a method completely opposite to that which the stage directions inculcate, by remaining on the same spot throughout the speech, and indicating only by intonation and facial expression the special meaning which Adrienne means the words to bear. This method may have something or may have much to recommend it; but an author, even of a play, has perhaps some right to be heard as to the manner in which his work should be interpreted. It is not likely that the stage directions of *Adrienne Lecouvreur* were printed without Scribe's sanction in the first instance, or that they have been interpolated since his death; and it is certain that Scribe knew remarkably well what he was about in everything connected with the playwright's craft. It "leaps to the eyes" that in this scene he wanted to contrast the impulsive actress's nature with the impassiveness which the Princess's training enables her to preserve. Both women are swayed by the same passion; the one cannot refrain from giving it some expression; the other conceals it with complete success and skill. Mme. Modjeska at this point followed exactly the stage directions which we have quoted, and gave the passage with much force and intention. In the rest of her performance there is much grace, and, especially in the scenes with Michonnet, the devoted old prompter, considerable tenderness; but she has in this part the same faults of gesture and the same want, as it seems to us, of the truest passion which we observed in her former representations. It was especially curious that the speech to the Princess in the scene of the "petite maison"—

> LA PRINCESSE. Je vous perdrai.
> ADRIENNE (*avec hauteur*). Et moi—je vous protège!

went for absolutely nothing. In Mme. Favart's hands it became, as it should be, one of the finest points in the part.

It is impossible to express any satisfaction with the support given to Mme. Modjeska in her difficult task, which of course becomes more difficult from the fact that she plays it in a language which is not her own. Mr. Anson's Michonnet and Mr. Lin Rayne's Abbé are alike inadequate. Mr. Forbes-Robertson's Maurice de Saxe is disappointingly wanting in grace, in dignity, and in fire. Mrs. Bernard Beere as the Princess, and Mr. Beveridge as the Prince de Bouillon, were not happily placed.

Mr. Coghlan's appearance at the Prince of Wales's Theatre in his own adaptation of *La Morte Civile* is an experiment the venturesomeness of which is not wholly excused by its success. *A New Trial* (as Mr. Coghlan's version of Signor Giacometti's play is called) is a tragedy of the gloomiest kind in four acts. Its motive, told briefly, is that a certain Corrado has escaped after thirteen years from the galleys, to which he was sentenced for life for the unpremeditated killing of his wife's brother under great provocation. He comes back longing to find a refuge with his wife and his daughter, and he is rejected by both of them. The daughter, not knowing who he is, recoils from him in terror; the wife, who, "like a well-conducted person," has kept up a steady and platonic affection for another man during the thirteen years, shrinks from him at first, and finally offers to follow his fortunes, or misfortunes, if he will leave the girl in safe keeping, but lets him see plainly enough that a tardy sense of duty has more to do with her proposal than any relic of the love which presumably she once felt for him. Indeed almost in the same breath with this proposition, she confesses, on Corrado's demand for the truth, that she loves Dr. Palmieri, the man who has, chivalrously enough, found a home for her and her daughter during Corrado's slavery. Corrado, learning this, resolves to drink some poison which he has managed to conceal ever since his sentence, and, acting upon this resolution, dies as the curtain falls, leaving his wife much in the position of Rowena in Thackeray's charming continuation of *Ivanhoe*. "Came the good lord Athelstane, When her ladyship married again." There is, indeed, something curiously revolting in the general tone of this play, which is moreover in the worst sense of the word, not in that of Scribe and greater play-writers, a "star" play. Everything has been sacrificed evidently enough in the first instance to the desire of providing a particular actor with a part in which he could make a display of his favourite accomplishments. Mr. Coghlan has been unable to dispel all traces of this special intention from his version of the play, and he does not succeed in giving an excuse for it in his rendering of the principal part. He is too much given to substitute violence for strength, and too apt to monotony both in his gesture and his facial expression. His performance of a terribly trying part always commands respect, but seldom approaches the passion which alone can make such a performance admirable. He has fine moments, but they come too seldom. For one point, his death scene, we have nothing but praise. Here, in the prologue to the event, he

displays real passion, and the actual rendering of his death is given with complete discretion and great impressiveness. It has no touch of the "scène d'hôpital" business which an eminent French critic has justly condemned, and it carries with it the sense of misery and awe which in the earlier acts Mr. Coghlan too often misses. Miss Amy Roselle plays the part of Corrado's extremely disagreeable wife with much skill, and perhaps with as much feeling as the character admits; Mr. Fernandez is excellent as Palmieri, and Mr. Flockton gives an admirable representation of the Abbé, who for some unexplained reason is constantly addressed as "Monsignor."

On the last three days of last week playgoers had an opportunity of witnessing at St. George's Hall a performance of the *Agamemnon* in Greek by undergraduates of the University of Oxford. The success of a performance of the same play at Balliol College last summer, with essentially the same cast, had no doubt excited a good deal of interest in London society; but it cannot but be regarded as remarkable that crowded audiences could be found to watch the representation of a tragedy in Greek by amateurs. The taste and ability of the company justified the interest of the public. From an antiquarian point of view, the performance reached the extreme limit to which modern scholarship and archæology could accompany it. As a purely dramatic spectacle, the main interest centred around Mr. F. R. Benson, whose personation of Clytemnestra was marked by singular force and originality. His figure and appearance lend themselves to a remarkable degree to a severe and archaic dignity of representation, but he did not rely on these alone; his actions were varied, rapid, and full of tragical force. Clytemnestra's coaxing Agamemnon to tread on the tapestries, and emerging from the curtain with the axe in her hand, are two extreme points which were rendered by Mr. Benson, on the one hand, with high intelligence and humour; on the other, with remarkable power. Cassandra was performed with care and refinement by Mr. G. P. Lawrence, whose first appearance on the stage, in the chariot of Agamemnon, was one of the most picturesque incidents of the performance. Cassandra, however, flagged in her long speech, and acting with fire and intelligence at the beginning and end of her part, allowed herself to be a little wearisome in the middle of it. Mr. H. A. C. Dunn, whose performance of Ægisthus has so much delighted some of our contemporaries, seemed to us to look the part extremely well but to act with insufficient vivacity. The part of Ægisthus is brief; but it offers considerable scope for acting, and the movement with which the indignant Chorus is repulsed requires an audacity and rapidity of movement which we missed in Mr. Dunn. Great praise is due to the Chorus, who not merely recited their strophes with clearness and propriety, but delivered the musical part of their performance with great taste. They acted with care; but, if the experiment is ever repeated, they might be recommended not to encumber the stage. At one point, when Cassandra had a very curious passage to deliver, the Chorus so filled the front of the stage that she was entirely concealed from more than half the audience. On the whole, we have to chronicle the remarkable success of a very perilous experiment.

REVIEWS.

ETIENNE DOLET.*

THE "sacred rust" of age endears to the more curious student many memories of the past for which the common crowd of readers have little interest or none at all to spare; and the Renaissance period in particular, resplendent to contemporary eyes with a galaxy of stars such as fills a midsummer night, lives for most of us only in a few representative names. Yet, in devoting to the biography of a scholar who is all but forgotten and a martyr left unmentioned by Foxe an amount of assiduous research which only a few experts will be able fully to appreciate, Mr. Christie has, we think, neither wasted his toil nor mischosen his theme. And this we say without any desire of being reckoned either among the select few to whom the recovery of any fact in the earlier history of the "divine art" followed by Etienne Dolet is a source of special joy, or among "the faithful" whose delight in any name connected with Rabelais resembles that of the Papimaniac islanders in the presence of a person who had seen the Pope. Indeed we may go further, and confess that it seems to us difficult to entertain any but a very limited sentiment of admiration for the character of Etienne Dolet himself. There is a heroic element, beyond doubt, in the high mettle of the persecuted man of letters who, unfriended and alone, defied the danger of death and told the truth to a king. In some other points, however, his character is repulsive, while there is much in his life that remains obscure. If, notwithstanding this, there is something fascinating in Mr. Christie's narrative, the reason must lie in the fact that the career of the unfortunate Lyons printer illustrates with extraordinary distinctness one of the most remarkable phases of the movement to which he may truly be said to have borne witness in his life and in his death. In the labours and aspirations of Etienne Dolet we plainly recognize some of the shortcomings as well as some of the nobler impulses of the later Renaissance, and his life reflects too faithfully, together with their ambition and their triumphs, what Pierio Valeriano lamented as the *infelicitas literatorum*. To this it must be added that no trouble has been spared by the author to render this biography as complete for its purposes as the circumstances of the case permitted. The book clearly deserves to be called a labour of love, though the passion indulged by Mr. Christie cannot have been either the hero-worship proverbial in biographers, or even the dislike of the Church of Rome which becomes the Chancellor of an English diocese. His wish has evidently been to furnish a solid contribution to the history of learning and letters; and as such his volume seems to us likely to survive, even apart from the value it will possess for the fraternity of bibliographers and bibliophiles, towards which the author, himself no alien in Arcadia, casts many a tender glance by the way.

The scholarly care with which Mr. Christie has investigated every part of his subject accessible to research, going over it as closely as, in company with M. Baudrier, he went over the path taken by Dolet on the day of his futile escape from custody, has naturally rendered him impatient of the *lâches* of less conscientious biographers. In the Renaissance age itself luxuriant vituperation would probably have taken the place of the sarcasms with which Mr. Christie punctures the "usual accuracy" of the *Nouvelle Biographie Générale*, the fallibility of his predecessor M. Boulmier, and the imaginativeness of the "most spiritual of the critics and biographers of Rabelais, M. Eugène Noël." Mr. Christie's own slips are of a different kind—chiefly eccentricities of style and grammar which, in a book about printing, one hardly dares to ascribe to ill-corrected proofs. The same explanation most readily suggests itself for enormities of detail, such as "*partie prêtre*," "in his *Poetices*," "the Hunniades" (as a plural), perhaps also for the inadmissible hybrid "Philip the Hardy." It is a pity that such disfigurements should not have been removed from a work of which the informing spirit is that of a scholarship indefatigable in perfecting a task undertaken for learning's sake. As to the proper names of scholars, which in this volume appear sometimes in their original modern, and sometimes in their Latinized form, Mr. Christie has generally (in accordance with the statement in his preface) followed the sensible plan of using the native names except where the Latinized were the usual style of the persons in question; "and it has sometimes happened that, for the sake of harmony, other writers are with them referred to by their Latinized names." No sense of harmony, however, can reconcile us to the form "Bombus"; nor do we see why Beza, because he is coupled with Charles de Ste.-Marthe, should be exceptionally disguised under his real name of Théodore de Bèze.

We suppose that it is natural for a scholar who has spent much time, examined many books, and visited many cities for the purposes of a monograph like that before us, to address himself occasionally, with a well-warranted consciousness of increased certainty of judgment, to the wider aspects of the theme of which his own forms part. More especially at the opening—and again towards the close—of his book Mr. Christie accordingly gives expression to views which it would lead us too far to attempt to criticize more closely here; but which, in part at least, seem to open the door to very grave controversy. Thus, in an early page, we have the statement, limited by no restrictions except those which the words contain, "that (except in Sadolet and perhaps in Erasmus) there was not in any of the men of the Renaissance either any recognition of Christianity, or even any consciousness of the need of religion as an element in human happiness or human goodness." It might prove difficult to establish the consistency of all the utterances of the several Italian and German humanists whose names might be pleaded in arrest of so sweeping a judgment; but self-consistency is not the note of this or of any analogous period of intellectual progress with which we are acquainted. We touch on even more dangerous ground when, in the same page, we read that "the Church generally at the era of the Renaissance, and the French Church from that time to the Revolution, present absolutely no points for the approval of those of us who are in harmony with the spirit of the nineteenth century, and have no sympathy with the so-called Catholic revival." We are not sufficiently familiar with the precise nature of the spirit in question to know whether it could reconcile itself to a recognition of much that is beautiful in the relations between Church and learning in the pre-Reformation days of the Northern Renaissance; but as to the French Church, was there not in its history, before the disastrous reaction for which no terms of horror are too strong, a period full of hopes and aspirations to which it is impossible for the advocates of a truly national Church to refuse their sympathy? We ask pardon for cavils which may seem almost as vague as the statements to which they refer seem sweeping; and, without noticing one or two other passages which have similarly suggested to us a query of hesitation, we turn to the special subject of this interesting book. Even the bare outline of its story may help to show what opportunities it offers for a literary and historical study of the highest interest; how successfully Mr. Christie has availed himself of these opportunities, it is only in our power here and there to indicate.

Etienne Dolet was born at Orleans in the year 1509, "in how honourable and indeed distinguished a position among my fellow-citizens, I leave those to speak of who place virtue below birth." This Ciceronian flourish of Dolet's has no reference to the legend of much later growth, according to which he was the natural son of King Francis I. This fable (except for a little difficulty in the

* *Etienne Dolet, the Martyr of the Renaissance.* A Biography. By Richard Copley Christie. London: Macmillan & Co. 1880.

matter of dates and ages) cannot be described as ill-invented, though it has probably never been better shown than by Mr. Christie what was the real nature of the relations between Francis I. and the Renaissance, and of the claims to grateful remembrance by literary men of a sovereign who in the year 1535 prohibited all printing in France under pain of death, and ordered all booksellers' shops to be closed under the same penalty. At twelve years of age Dolet became a student at the University of Paris, where he remained for five years, and was imbued with that belief in the plenary inspiration of Cicero which, says Mr. Christie, was held by him and others "as absolutely as is a similar doctrine applied to other writings in our own day held by men whose learning and virtue entitle their opinions to the highest respect." From Paris he passed to Padua, where Bembo was then residing, "a Pagan of the Pagans," of whom in his pleasant, unregenerate, because still unhatted, days Mr. Christie gives one more charming sketch. The chief Professor of Latin at the University was the "Belgian" Simon Villanovanus, to whose instruction Dolet largely owed his Latin style, and from whose papers Dolet's enemies afterwards accused him of having stolen much of his chief work as a scholar, the *Commentaries on the Latin Tongue.* After the death of Villanovanus Dolet would have returned to France had he not been persuaded by Jean de Langeac, Bishop of Limoges, who was on his way as French Ambassador to Venice, to accompany him thither in the capacity of secretary. Although at Venice he eagerly attended the lectures on Cicero of the public Professor of Eloquence, Egnazio, he adopted the advice of his friend and patron, who urged him to devote himself to the study of the law, with a view to future official employment. Whatever hopes he may afterwards have entertained of appointment to a legal office were, as will be seen, frustrated by the consequences of his own conduct; and the bent of his genius was certainly towards the career in which he actually engaged. But it is not a little instructive to find that this French classical scholar—like the German humanist Eobanus Hessus, who, poor man, called himself the king of his literary world—would have adopted a profession lucrative as well as learned, if circumstances had allowed.

It was, then, as a student of law that Dolet in 1532 entered at the University of Toulouse. Mr. Christie's account of this University, and of the city in which it was placed, is so full of interest, and in many respects of novelty, that we would gladly have dwelt upon it at length. Toulouse was at that time, as it had been for three centuries, the most bigoted city in France; here the Inquisitor-General of France, whose authority in Languedoc only was undisputed, held his court, nor might either the Governor of Languedoc or the King himself enter the walls of the city without first taking an oath before the Inquisitor to preserve the faith and the Holy Inquisition. It was in the very year of Dolet's arrival at Toulouse that Jean de Caturce, Licentiate of Laws of the University (who so death, unlike Dolet's, is duly recorded in the *Book of Martyrs*), was executed for heresy, a general raid upon heretics having been decreed by the Parliament of Toulouse in consequence of some preachers of Lutheranism having made their appearance there. Among the other persons arrested was Jean de Boyssonne, a jurist and scholar of high eminence, whose name Mr. Christie is specially anxious to reclaim from oblivion. He consented publicly to abjure his errors; but, though many complaints were heard against the leniency shown to him, we are told that anger and grief filled many who witnessed the humiliation of one of the most learned and popular teachers in the University. After his recantation De Boyssonne withdrew for some months into Italy; on his return he is already found on terms of great intimacy with Dolet.

For, while still a student at Toulouse, Dolet had found an opportunity, to use the phrase of a previous biographer quoted by Mr. Christie, of "laying the first faggot of the terrible pile on which, fourteen years later, he was to be consumed." Of the "nations" into which, as in other mediæval Universities, the students at Toulouse were divided, the most numerous and important were that of the French and that of the Aquitains or Gascons. As the chosen "orator" of the French nation, Etienne Dolet delivered an harangue in which he vehemently abused the Parliament and magistrates of Toulouse for certain censures and (probably) restrictions which they had found it necessary to lay upon the proceedings of the "nations." The Gascon "orator" having replied in a tone of servility towards the authorities, and, as in duty bound, of insult towards the French nation and its orator—"a Ciceronian, a Lutheran, and a heretic"—Dolet replied in a second oration. On this occasion, with a courage not altogether to be ascribed to the hot-headedness of youth, he delivered himself of a set invective against the religious bigotry of Toulouse—a city which he declared to have not yet acquired even the rudiments of Christianity, but to be given over to superstitions worthy only of the Turks. Having, in addition, insulted the Lieutenant-General of the Seneschalty by a series of odes in ridicule of his attempts at poetry, and altogether contrived to make himself as offensive as possible in all influential quarters, Dolet can hardly have been astonished at the consequence which ensued. Early in 1534 he underwent his first experience of prison, which one of his enemies afterwards called *patria Doleti*; for, says Mr. Christie, "during the remainder of his short life (thirteen years only) he suffered no less than five imprisonments, occupying in the whole about five years, in addition to this at Toulouse," which only lasted a few days.

After his liberation he soon found it necessary to withdraw from the "barbarous" city in order to avoid a second arrest; and a sentence of perpetual banishment from Toulouse and the district within its jurisdiction followed him into his retreat. He took refuge in a town which may claim for itself no small part of his fame, as indeed of the glories of the French Renaissance in general. Mr. Christie shows in different parts of his work, how Lyons, where, between the years 1530 and 1540, Rabelais, Marot, Servetus, and other illustrious men of learning or letters passed several years, and where many others were frequent visitors, must have contrasted with Paris in the freedom, and surpassed all other French towns in the activity, of its intellectual life; and how in the Lyons press, whence had issued the first French books ever printed in France, and which in the sixteenth century largely extended its operations, this activity and freedom most significantly reflected themselves. Lyons was Etienne Dolet's home for twelve years, during the last seven of which he was himself the owner of one of the most productive printing presses of the city. He thereby, as it is perhaps needless to state, by no means forfeited his position as a man of letters; indeed, the functions of printers such as Dolet or the Stephani were primarily those of scholars, and his setting up of a press of his own represents rather the consummation than the termination of his literary career. That career is in many respects typical of the lives of the humanists in general, though few of these were the equals of Dolet in productive energy, and none can have surpassed him in quarrelsomeness. He by no means belonged to that species of humanists which is the least interesting to posterity, and which Erasmus condemned several centuries ago, though its shortcomings are occasionally proclaimed as a matter of recent discovery. He was a student of matter as well as of form. His great lexicographical work on the Latin tongue only missed a more enduring fame by reason (as we think Mr. Christie satisfactorily shows) of a method of arrangement which the public was too indolent to accept. In several other works he showed himself a scholar and a poet of mark; and as a translator from Latin into French he achieved an enduring success with so difficult an original as the *Epistles of Cicero to his Friends.* But his strongest bent seems to have been towards historical composition; though of the history of his own times, which was to have been the *opus magnum* of his life, he was destined only to accomplish a fragment. On the other hand, he unfortunately lived long enough to quarrel with nearly all the friends with whose name his own is linked in the remembrance of posterity, besides incurring the contempt of Erasmus, the grave censure of Melanchthon, and the furious wrath of Scaliger. The raking together of the dust and ashes of these dead quarrels is not the most attractive part of the task of the literary biographer; and Mr. Christie has had a more than ordinary share of such labour to undergo in narrating, with a candour which is too inevitably damaging to his hero, Dolet's quarrel with Sussaneau, his quarrel with Voulté, and his quarrel with Rabelais. That with Marot remains open to question; and if in the days of his final troubles Dolet was abandoned by his old correspondent Boyssonne, those troubles and not himself may have been the determining cause of the desertion. Perhaps it should be added that in his purely domestic relations, of which the *Genethliacum* remains as a pleasing monument, he seems to have been far happier than in his dealings with most of his literary friends and acquaintances.

As to the troubles aforesaid, it is at least manifest that they were not of sudden growth. We are reluctant to express an opinion upon two interpretations of facts differing so widely as those of Mr. Christie and M. Baudrier, who happen to be in all probability the two authorities best acquainted with the subject. At all events, however, it seems clear that the proceedings against Dolet represent accumulations of wrath to which many sources had on many occasions contributed, and that he did his utmost to have a place among the numerous printers and booksellers whose names, as Mr. Christie reminds us, are recorded in the grand Martyrology. Unfortunately, one of the bitterest animosities which he had aroused against him was that of his own follow-traders, the printers of Lyons, whose jealousy he had provoked by a royal privilege secured by his pertinacious efforts, and whose fears he had excited by siding with the workmen against the masters in one of those trade disputes indigenous to the Lyons soil. His patrons were dead; his friends he had alienated or lost; whatever offence he gave, there seemed no kindly shield left to cover it. And from his youth up it had been his habit to give offence, where the strongest considerations to the contrary had not intervened. There is no reason to suppose that he had any serious Lutheran leanings; and, as Mr. Christie shows, not only were the suspicions of atheism against him groundless, but there is no reason to think of him even as what might be vaguely termed an irreligious man. But he was *suspect* nevertheless, and though a member of a profession in which, even in the relatively free atmosphere of Lyons, caution was the first law of existence, he was clearly unable to restrain his tongue even before he gave his enemies the chance of a printed scandal. When at last he laid himself open in this way, his offences were of so slight a nature (though they included the wittiest of his productions cited by Mr. Christie, an epigram on "the dead to the world"—to wit, the monks), that the burning of the books which contained them was deemed a sufficient sentence. Soon afterwards, however, a new prosecution followed; and this time the charge against him was a capital one, and the tribunal before which it was brought was the Inquisition. Condemned by this tribunal, and handed over to the secular arm, he appealed to the Parliament of Paris,

and meanwhile resolved to avail himself of the chivalrous advocacy of the King's reader, the famous Duchâtel (now Bishop of Tulle), in order to obtain a pardon from the sovereign.

The narrative acquires a powerful interest, sustained by various unexpected turns, as it draws towards its catastrophe. From his prison Dolet had loudly impugned both the wisdom and the lawfulness of his condemnation; yet with King Francis I. the pleading of Duchâtel and the remembrance of his own better self had nevertheless prevailed over the growing influences of bigotry. A pardon was granted, and an attempt to detain the prisoner on an earlier criminal charge of a totally different character was promptly defeated by the issue of further letters patent. Dolet returned a free man to his Lyons printing-office. Soon, however, another prosecution was upon him, and he was in prison once more, charged (probably quite falsely) with having introduced into Paris a number of prohibited books, including translations of Holy Scripture into the vulgar tongue. He very cleverly contrived to escape, and found a refuge in the mountains of Piedmont, where he occupied himself in the composition of a series of poems which—in part allusion to the poetical designation given by Clément Marot to his imprisonment for heresy—he entitled *Le Second Enfer*. These verses prove not only that Dolet was possessed of true courage, but also that he had in him a vein of true poetry. As regards his courage, we quote half a dozen lines from a poem addressed to King Francis I.:—

> Il n'est pas temps, ores, que tu t'endormes,
> Roy nompareil, des vertueux le père :
> Entends tu point, au vray, quel vitupère
> Ces ennemys de virtue te pourchassent,
> Quand les sçavants de ton royaume ils chassent,
> Ou les chasser à tout le moins prétendent ?

These poems, in a spirit of touching confidence in the justice of the cause of which he manifestly looked upon himself as the champion, Dolet proposed to present to the King, after having had them printed at Lyons in a volume also containing two Platonic (or rather pseudo-Platonic) dialogues translated by himself. One of them, the *Axiochus*, contains, as part of an argument cited by Socrates from Prodicus, the following words descriptive of the state of a man after death:—σὺ γὰρ οὐκ ἔσει. These words the translator had amplified into "Attendu que tu ne seras plus *rien du tout*." Poems and translations were boldly brought across the frontier by Dolet and committed to the press at Lyons. But probably before their publication there, the daring author was himself arrested—as Mr. Christie thinks, at Troyes in Champagne, when on his way to the King. The prisoner was immediately taken to Paris, where, after nearly two years, on August 2nd, 1546, sentence was pronounced against him by the First President of the Parliament. The passage in his translation of the *Axiochus*, with the heterodoxy involved in it, certainly constituted one of the charges against him; for it is known to have been submitted in November 1544 to the censure of the Sorbonne. But was the persecution mainly based upon this ridiculous charge, or upon the sale of the prohibited books, or upon something further? Is there any special significance in the fact that he was ordered to be put to the torture before his execution, in order that he might inform of his companions; or in the further addition to the sentence that, if he should cause any scandal or utter any blasphemy, his tongue should be cut out, and he should be burnt alive? At any rate, the verses which he wrote in the Conciergerie, shortly before he was burnt to death on the Place Maubert, are worthy to be remembered as not less noble, while better authenticated, than the famous lines supposed to have been written under similar circumstances by Sir Walter Ralegh. And, even more strikingly, the fine epitaph in which a contemporary commemorated the death of the martyr of the Renaissance, recalls in its concluding lines the often-quoted noble conceit of Fuller concerning the ashes of the father of the Reformation:—

> "Mort est Dolet, et par feu consommé.
> Oh ! quel malheur ! oh que la perte est grande ;
> Mais quoy ! en France on a accoustumé
> Toujours donner à tel saint tel offrande.
> Bref, mourir faut ; car l'esprit ne demande,
> Qu' issir du corps, et tost estre délivre,
> Pour en répos ailleurs s'en aller vivre."
> C'est ce qu'il dit, sur le point de brusler
> Pendant en haut, tenant ses yeux en l'air :
> "Va-t-en, esprit, droit au ciel pur et munde,
> Et toy, mon corps, au gré de vent voler,
> Comme mon nom voloit parmy le monde !"

LIFE OF SIR ROWLAND HILL.*

(*Second Notice.*)

VARIOUS circumstances had turned Rowland Hill's attention to postal matters tolerably early; but it does not appear that any regular scheme of general reform, as distinguished from mere mechanical improvements of detail, suggested itself to him until he had begun his work as Secretary to the South Australian Colonization Commission. As a devout Free-trader, he had long had a general confidence in the elasticity of the revenue; and the notorious inconveniences, inequalities, and hardships of the existing postal system soon drew his attention to this tax, if it may be so called, as one which might be lowered with the greatest amount of advantage to the people. The idea of penny postage, however, was not reached at once, or in any haphazard manner, but simply by a laborious process of calculation of the actual expenses of collection, transmission, and delivery, the data being obtained by much study of Blue-books. In these studies Mr. Hill was a good deal assisted by Mr. Wallace, member for Greenock, who himself succeeded in getting a good many details of reform introduced into the Post Office. All this, however, was merely preliminary to the issue of the pamphlet on postal reform which Rowland Hill, duly encouraged by a family council, at last laid before the Government and then before the public. It seems really remarkable that only three years should have elapsed before penny postage became an accomplished fact. Considering the usual slowness of such things, considering the certainty of a diminution of revenue for the time, it is rather more remarkable that it ever got a chance of being tried. But at the present day the most curious thing is the opposition with which what are now the most familiar parts of the scheme, the use of envelopes and the use of adhesive stamps, were received. Only the very youngest reader can fail, however, to remember a time when it was still no very uncommon thing to find on the breakfast-table a letter folded up and directed on the same piece of paper, instead of being enclosed in one of the "little bags called envelopes." Stamps themselves were confessedly an afterthought, the inventor having originally limited his plan to stamped envelopes or wrappers. This is the way in which the now familiar thing is described laboriously by the father of it:—"A small stamped detached label—say about an inch square—which, if prepared with a glutinous wash on the back, may be affixed." When the Bill for establishing penny postage became law, it was natural that some position should be assigned to the inventor which might enable him to supervise the carrying out of his plan, to which the actual authorities of the Post Office were avowedly hostile. The question how this was to be done was of course a difficult one; but it was certainly solved in the worst possible way—a way which put the inventor himself in a position as false as it was precarious, and which was undoubtedly the origin of the annoyances which he afterwards underwent, as well as of a certain amount of general unpopularity which, as in the case of other public benefactors, attended him. He was appointed for two years only to a post in the Treasury, created for the purpose and incapable of being designated by any very exact title. To say that he was a kind of Treasury watcher over the Post Office would be rather invidious than inaccurate. It was not likely that such a position would conciliate the actual Post Office authorities to him, and its creation was utterly illogical. If those authorities could be trusted to carry out the reforms, he was superfluous; if they could not, they should have been removed, and he should have been put in their position. The precariousness of his appointment, moreover, was obviously a mistake; and it is only fair, when we see the very natural irritation with which Sir Rowland speaks of the Tories who removed him, to remember that their Whig predecessors had deliberately and obstinately refused to make the appointment other than temporary. However, awkward as was the position to which he was appointed, he made the most of it to further the object he had at heart. The covers and stamps were at last issued to the public; both being greeted with a good deal of ridicule. It is indeed difficult to imagine what evil spirit could have induced any one to fix on the preposterous device which Mulready drew for the covers, and of which a representation is given here. But an article of comment, also given, supplies a pleasant notion of the amenities of the British newspaper only forty years ago. The unlucky design just mentioned is not abused much more than it deserves; but Mr. Hill himself is elegantly described as "obtaining 1,500*l*. a year for strutting about the Post Office with his hands in his pockets and nothing to do, like a fish out of water."

The History of Penny Postage enters minutely into all the difficulties and vicissitudes of the years in which the scheme was launched, and in which, as indeed at later times, the author's mechanical inventiveness and that of his family were nearly as frequently called into requisition as his powers of organization. But, awkward as was the manner in which he had to apply leverage to the Post Office, even that awkward position at length gave way under him. The Whigs went out, the Tories came in; and the Tory Chancellor of the Exchequer, never very favourable to the scheme, naturally looked first of all at the diminution of the revenue. This, though transient and much exaggerated, was of course a fact, and an unavoidable fact. Penny postage could not be got rid of, but its author could, and at the end of three years Rowland Hill was cut adrift. His repute for organizing energy was, however, so high that, pecuniarily speaking, the loss was a gain to him. Various public Companies, and in particular the London and Brighton Railway, gladly claimed him, and during the years in which he was out of office his income frequently reached an amount equal to four times his official salary; while a testimonial amounting to more than thirteen thousand pounds was collected to make up to him for the unhandsome treatment which he had certainly received, though, it must be repeated, that treatment was in effect Mr. Baring's fault, and not Mr. Goulburn's. This testimonial was regarded, as one of his friends happily told him, as a retainer to keep him ready to accept service in the Post Office when the opportunity came and his political friends returned to office. They did return, and Rowland Hill was reinstated, though in the same awkward way in which he had been originally

* *Life of Sir Rowland Hill, K.C.B., and History of Penny Postage.* By Sir Rowland Hill and George Birkbeck Hill, D.C.L. 2 vols. London: De La Rue & Co. 1880.

installed by the same persons. He was not, indeed, replaced at the Treasury, and the ridiculous nominal separation from the department in which he was really engaged was done away with. But an arrangement almost more certain to produce friction was resorted to. The Secretary to the Post Office was retained in his position, and Rowland Hill was made Secretary to the Postmaster-General. The relation of these two high functionaries was very ill defined. The older and more highly-paid functionary naturally declined to acknowledge the equality of his supplanter. The new-comer as naturally asserted it, and the result was what Lord Hardwicke, their chief, not inappropriately defined as two Kings of Brentford, though, unluckily, the Post Office sovereigns were not so amicable in their relations as their prototypes. However, at the cost of much friction and unpleasantness, and of a most improper call on Mr. Hill's energies, things went on somehow, and at last, after many years, he became sole Secretary, and held the post until a period which most of the readers of this book can remember well enough. He could then carry out his plans, or such of them as he had not previously succeeded, in spite of opposition, in carrying out, and reforms and administrative improvements of all sorts were rapidly introduced. Mechanically, perhaps the most interesting of these was the ingenious device for automatically delivering and collecting bags from the night mail trains, which was perfected by his son, Mr. Pearson Hill. Economically, the palm must be given to the plan of Post Office Savings Banks. The credit of this suggestion is here fully and fairly ascribed to Mr. Sikes, of Huddersfield, who, we believe, is still living, and whose part in the matter is scarcely so generally recognized as it should be. In 1864 Sir Rowland resigned, and outlived his resignation fifteen years, enjoying during that time the Parliamentary grant of 20,000*l.* which had been made him in lieu of the very inadequate pension to which, owing to the lateness of his entry into the public service, he was formally entitled. His life was thus, despite its labours, an unusually prolonged one. But it must not be thought that he got off scot-free. If the good fortune of his outward circumstances and the family affection which he enjoyed prevented the last fifth of his life from being mere labour and sorrow, the record of his physical weakness is painful to read. His over-wrought brain could not bear the slightest noise or any irritating motion, and regular exercise was impossible except to a very limited extent. Fortunately his eyesight did not fail him, and he was a reader almost to the last.

In reading this life of one who, in his way, was "ever a fighter," and who was not unfrequently made to undergo some severe reverses, one naturally asks oneself the question whether these reverses were altogether unmerited. Frequently they were, as, for instance, in the famous "Lord's Day Observance" scare, during which Rowland Hill was actually persecuted and vilipended as a Sabbath-breaker for instituting reforms which gave the servants of the Post Office a very large increase of rest on Sundays. But there is no doubt that he had become, by the time of his second entrance into the public service, almost a man of one idea, and that to that idea he made some sacrifices which a perfectly discreet person might not have made. A very curious story is told here of his meeting Garibaldi at dinner and interrogating him on the state of the Italian Post Office, which made his brother Matthew, the Recorder of Birmingham, suggest that when he got to Heaven he would probably stop to cross-question St. Peter on the number of deliveries per day in the celestial regions. This devotion to his ideal may sometimes have induced an appearance of ungraciousness. In his almost ferocious determination to keep down the expenses of the Post Office, so that the prophesied recovery of the revenue might take place, he did things which must have made him very unpopular. Thus he found that a custom had existed in the Office of construing a fortnight's holiday to mean leave of absence for fourteen working days. Technically, no doubt, this was an abuse, and must have resulted in a certain increase of expenditure. But when one thinks of the great gain to a hard-worked clerk of being able to start on Saturday and return on Monday, especially in days when Sunday locomotion was even more difficult than at present, and of the disproportionate irritation which the retrenchment of small privileges always causes, it is difficult not to think that it would have been wiser to let things alone. Again, the perpetual efforts which he made to put an end to the doubtless mischievous friction at the Office by getting his rival, Colonel Maberly, shelved, were beyond all question disinterested, and intended only to further the public service. But they must have had, to say the least, a disagreeable appearance to successive Postmasters-General and successive Chancellors of the Exchequer.

The present arrangement of the book, according to Sir Rowland's own desire, necessarily exhibits all these *tracasseries* at somewhat inordinate length, while it keeps out of sight the merits and attractions of the author's private character. Probably no man ever went less out of his way to represent himself in a favourable light, or to allure the reader by anecdote or gossiping detail, than Sir Rowland Hill in this History of Penny Postage. He must have been constantly in contact with men whose words and actions would be interesting to the public; but he rarely condescends to an anecdote. It is certain that this was not from want of material, and a few rare exceptions make it equally certain that it was not from want of faculty to work that material up. A page of the first volume contains as characteristic a sketch of Lord Melbourne, and two as pithy apophthegms ("I can understand your physical force men, but as for your moral force men I'm d——d if I know what they mean," and "I can't think why a man can't talk of penny postage without going into a passion"), as any lover of personal gossip can demand. But, as a rule, and unless the idol was directly concerned, Sir Rowland is very chary of such things, while he spares hardly a letter of complaint against Colonel Maberly the obstructive Secretary, or a minute of expostulation with backsliding Chancellors of the Exchequer. Dr. Hill has wisely struck out much of this, and relegated much more to the appendix; but of the three "books" of which the two volumes consist, his own—the first and third—so much exceed the second in interest and merit, that it is impossible not to ask for the refashioning of the whole on the same plan, now that the *droits d'auteur* have been duly acknowledged by the appearance of the History. We cannot better conclude this review than with a pleasant anecdote which Dr. Hill tells of his grandfather and grandmother:—"I know not whether my grandfather had any rivals. But a story that is told of his old age leads me to think that he must have had at least one. . . . . His wife, when they had been married close on fifty years, one day called him, with a Birmingham plainness of speech, an old fool. A child who was staying in the house overheard him as he left the room, and slowly went up the stairs, muttering to himself, 'Humph! she called me an old fool! An old fool!' Then he stopped, and was silent for a few moments, till suddenly rubbing his hands together, he exclaimed, 'A lucky dog I was to get her though!'" These little things are the salt of biography, and we have no doubt that Dr. Hill, if left to himself, could have seasoned the record of his uncle's combatant period with plenty of them.

FAR OUT, OR ROVINGS RETOLD.*

THAT Colonel Butler could cleverly describe the savage men and savage manners of North America we already knew from his *Great Lone Land.* The present volume, which is chiefly composed of reprints of magazine articles, reminds us that he has seen a good deal of natives besides the Red Indian. He is familiar with Zulus and Basutos, and with Greek sufferers from Turkish misrule in Cyprus. And, though his diction is occasionally exuberant and his stories of life in camp and at new settlements in the far West have a tinge of sameness, he can claim to be a keen observer and a fearless critic. Not in the least blind to the failings of uncivilized races, he is severe on the treatment they have received from white men; and unscrupulous Yankees come in for condemnation equally with the pugnacious colonists of Natal. It is quite impossible to make out the smallest connexion between the various chapters of this work, or even to do more than guess at the dates or periods of each visit. But every chapter is marked by a thirst for adventure, by the enjoyment of natural scenery, and by a love of fair play. Perhaps we have a little too much of glowing sunsets, odorous pine forests, skies intensely blue, peaks of eternal snow, weird sounds and whispering trees. But these pages are full of life, and the observations are epigrammatic and pithy, and several of the anecdotes are racy, if not wholly new. An American informed the owner of a dog that he had never "druv" those animals, but that the language "that had most *cussing* in it" was the best for that purpose. A Britisher in primitive Californian society is described as a man who is "put out," because, in his travels, his club has not been sent on just one day ahead of him. English travellers generally are requested to bear in mind that America is only a "semi-tropical England, minus the Norman Conquest." In the same vein British Columbia, despite its vast area, is only one "long waggon road, with a gold mine at one end and a seaport at the other"; and "the highest extreme of American snobbishness is but Anglo-Saxon vulgarity run to seed."

The civilization which fights hard to win a victory over wastes and wildernesses, and which is represented by a group of log huts and an occasional "store," has been often described; and there is nothing very striking in what is intended for a ghost story connected with the burial of a fur-hunter, but is really explicable, like scores of these tales, by the natural cries of animals acting on an excitable Canadian and a nervous Scotch clerk, who were conveying the dead body to its resting-place at Fort Simpson. We prefer to hear Colonel Butler on the Territory of Oregon and the Yosemite Valley. He scarcely finds language strong enough to express the fatal mistake which England made in abandoning to America the wealth of forest, sea, and mountain comprised in the former territory. Splendid rivers, lofty timber, broad lands waving with corn, orchards heavy with fruit, a bright sun and a blue sky, make it all that any emigrant could desire. Locomotion is of course still in its early stages of development, but a journey of sixteen hours on a rough coach, ending in a roadside inn with its damp bread and greasy meat, were in a measure compensated by views of snow-capped peaks and by an exhilarating climate. If we are to credit Colonel Butler, the winter is not too cold nor the summer too hot. The peaks remind him of Switzerland, and the plains and pastures of Somersetshire. Yet mountains and forests, and some three thousand miles of shore, fanned by the soft breezes of the Pacific, sound tame by the side of the Valley of Marvels. The discovery of this secluded spot is due, we are reminded, to certain farmers, harried by the repeated forays of a tribe of Indians whom the most practised trackers could not follow to

* *Far Out: Rovings Retold.* By Lieutenant-Colonel W. F. Butler, C.B., Author of "The Great Lone Land," "The Wild North Land," &c. London: W. Isbister. 1880.

their lair. Baffled in successive attempts, a party of these farmers at last swore they would stick to the next track of their enemies till they ran them to earth. After days of pursuit they came on that vast depression which, like the fabled Valley of Diamonds in the *Arabian Nights*, had kept out the civilized world by a sheer wall of rock more than 2,500 feet in height. Colonel Butler laments over cockneys and innkeepers who profane this wonderland; but we gather from his description that it has features which are proof against the jaunty impertinence of tourists. Cascades which take leaps of five hundred feet and more at a time; green meadows watered by a pellucid stream; trees, of which the summits, like those described by Virgil, are beyond the flight of an arrow, and are of an age which mocks at ordinary dates; forests of magnificent pines without any undergrowth of jungle; and one celebrated rock which rises out of the very centre of the valley, on a level with the top of the wall from which the traveller looks down—all combine to produce a picture which no vulgarity can well degrade or spoil. And the sharp American who boasted that he would build an hotel and make his fortune at the very foot of one of these gigantic waterfalls was only anticipating the peremptory requirements of civilization on its travels. There is no reason why pilgrimages to what the author terms a "vast cathedral" designed by Nature should not be associated with that ordinary amount of comfort which Captain Absolute tells Lydia Languish may, after all, be endured.

A chapter on Afghanistan is a curious sequel to the Yosemite Valley; and we regret to say that neither by skilful treatment nor condensed information does Colonel Butler throw any new light on a difficult and disputed subject. Indeed he confines himself to a very brief description of its physical features and its early history, and to the campaign which ended with the triumphs of Pollock and Nott. Moreover, he describes the invasion and occupation of 1838–9, and our departure in 1842, as the results of "three years' wanderings in search of a scientific frontier." Lord Auckland and Lord Broughton had a good deal to answer for, but they are not responsible for a clever phrase invented three years ago, and of no application to British India while the Sikh empire was still unconquered. In this chapter Colonel Butler informs us that, "where the great range of the Hindu Kosh sinks down to meet the Valley of the Oxus, a vast mountain cavern is called, in Sanskrit lore, the Cave of Prometheus." We should like to know the book or the Pundit responsible for this amazing piece of information. There is, we believe, a fanciful connexion between the Greek Prometheus and the Sanskrit *Pramathana*, "one who obtains fire by rubbing together two pieces of wood"; but we must regard the statement about this cave as "haphazard" and not "scientific."

With the Zulus and the Basutos the author is much more at home. In his account of the formation of Colonies, Republics, and Free States he is governed by one dominant idea. The native is down-trodden, injured, and driven into war. The English settler holds that the black man was created to labour for the white. Out of this theory arise all the expeditions, invasions, seizures of territory, and arbitrary determinations of boundaries which are familiar to those who study South African politics. Settlers are energetic, high-handed, and imperious. Natives fiercely retaliate, or resort to that fraud and evasion which are the proverbial resource of the weak. Military expeditions are easily got up, or, what is worse, a sort of foray called a "commando" is undertaken "to gratify the cupidity or vengeance of an English or Dutch farmer," and, if not properly controlled by the leaders, may extend to a night surprise, the destruction of crops and cattle, and other outrages with which Irish newspapers have just made every one familiar. Experience of the difficulties which arise between the English and the Oriental or the dark-coloured races may lead men to endorse several of Colonel Butler's remarks; but, unfortunately, he gives us but little help towards a settlement of such problems. Nor are we quite prepared to agree in his axiom that the negro becomes more dishonest from mere contact with civilization. A similar argument has been used by some reformers who contend that, but for British officials and barristers, Hindus would be the models of candour and fair-dealing which they are vaguely supposed to have been under the administration of Akbar or Jehangir. The author's remarks on the climate of Natal and the neighbouring States are more pertinent than his judgments on national character. But even here we are perplexed by seeming contradictions. Natal has three or four varieties of climate. It is semi-tropical at the coast, and is exposed to frosts fifty miles from the sea. Coffee and sugar-cane flourish in one zone, and imported pines and oaks grow to the height of forty feet in another. The great staple is Indian corn; and there are rumours of South African mineral wealth—gold, coal, iron, and copper—hardly tapped and practically inexhaustible. But, when speculating whether all this natural wealth might not attract emigrants, we are reminded of useless rivers, shallow harbours, imperfect communications, and a railroad system quite in its infancy. The only thing about which there can be no dispute or doubt is the enormous area wanting a population. For the present, however, we suspect that Natal and the other colonies are places where Englishmen can only achieve independence and live in tolerable comfort; they will not make their fortunes, and they may have to fight for what they have. We recollect an anecdote of the late Sir Harry Smith, not mentioned by the author in his account of the native chief Moshesh, about whom we are told a good deal. The conqueror of Aliwal, at a conference with this potentate, addressed him in the following terms:—"If you, Moshesh, obey these orders, your oxen will get fat, and you will go to heaven." We much fear that native rulers have been used to different language of late, and that, money-making apart, English settlers will not now find much to tempt them in Natal, or anywhere in the neighbourhood of Zulus and Basutos.

It is rather difficult to know the precise object of the author in publishing the chapter entitled "A Plea for the Peasant." It is made up of complaints about the youth and rawness of recruits, the depopulation of Highland glens, the misgovernment of Ireland, what sort of advice Cromwell gave to Hampden, and what was said by a clerical magistrate to a Methodist preacher who had been pressed into the army somewhere about the date of Dettingen or Fontenoy. As far as we can make out, Colonel Butler inclines to the opinion that in order to recruit an army equal to the task of protecting our own shores from invasion and of marching right through Asia, if necessary, it would be expedient to give the peasant some sort of proprietary or permanent right in the soil. But we are not going to be tempted into a disquisition on this tremendous subject by a few vague hints thrown out in a survey which ranges from Jemappes and Jena to Inkerman and the Redan.

On the whole, after the papers on Oregon and the Far West, we find most to attract us in the trip to Cyprus. We do not agree with the author in thinking that in popular estimation the cession of Cyprus ever stood very high. No trustworthy writer ever described it as anything beyond an island of fair capabilities. Liberal speakers never ceased to talk of it as a hotbed of fever and a political mistake. It was, almost from the date of its cession, reported on as dusty, barren of trees, and well calculated to send soldiers and sailors to the hospital. Nor are we surprised to learn that both Larnaca and Nicosia appeared dirty and squalid, in spite of minarets and mosques. A week's acquaintance with the Delta of the Nile, or with a single city in Asia Minor, should have prepared Colonel Butler for what he saw when one of those fresh mornings, which he so loves to describe, revealed to him a succession of swamps reeking with malaria, watercourses without water, flat mud roofs, fields covered with thistles, and telegraph posts only serving to point the contrast between English civilization and Turkish misrule. However, matters improved on a visit to Kyrenia, and to a monastery which the author calls Bellapays. The beauty of the place was enhanced by the hospitality of a Greek, who treated Colonel Butler to coffee in small cups, preserves of fruits, oranges, pure water, and a glass of mastic. Similar hospitality was afforded him at the monastery of Kiku, high up in the mountains. A monk appeared with a gun and an empty game-bag, but the traveller was welcomed in warm and comfortable quarters four thousand feet above the level of the sea, and was refreshed with coffee and sweetmeats and Commanderia wine. At another place the repast, though plentiful, was not quite so inviting; and it is recorded for the benefit of future tourists that, of all indigestible compounds, nothing equals a preparation of walnuts steeped in honey. Of the administration of the island Colonel Butler tells us little; but we gather that, between corrupt Turks and unskilled Englishmen ignorant of the language and the habits of the people, the benefits of British administration have not been sensibly brought home to the people. But, if we were to propound reforms for the assessment and collection of the Cyprian revenue, we should stray almost as far from the duty of a critic as Oregon and the Frazer River are from Famagosta and Troados.

HE THAT WILL NOT WHEN HE MAY.*

IN the present tale Mrs. Oliphant illustrates a proverb which falls in very aptly with her habitual tone of thought and opinion. The story may be said to have a didactic purpose; and it addresses itself to readers whose views of life are unformed and still need the check of experience, and who are also uncritical enough to be indifferent how a groundwork is laid, so long as it furnishes a foundation for a plot. Thus she expects them to accept as probable, or at least as possible, the position that a wise statesman of European celebrity, and in the full vigour of his intellect, should practically forget, never in all his plans take into account, the fact that he has a son and heir living no farther off than Barbadoes, and should treat a son by a second marriage as the inheritor of his wealth and title. For readers of this tractable order the author can trust her facile pen to run on by its own impetus on any congenial topic, and such is the scope and moral of the present story. When her line is to show that, whatever people profess, they are all guided by some form of self-interest more or less respectable; when the tone taken is one of gentle depreciation of the pretensions to self-sacrifice which a high profession or large views always involve, she has not far to seek for the appropriate language and actions which betray this human weakness—a weakness absolutely universal in her estimation. Some principles are more congenial to her than others, but the heroic standard is never reached in her delineations, and it would be out of her way to attempt it. This is a pity, for though we none of us know many heroes, yet it is one of the higher provinces of fiction to set them before us. Not that the hero of a novel need be perfect in order to fulfil his proper office; but there should be a truth and consistency in his course; he should

* *He that Will Not when he May.* 3 vols. By Mrs. Oliphant. London: Macmillan & Co. 1880.

at least be able to make a sacrifice, and to stand his ground. In the present instance, the motive for self-sacrifice does not fall in with the reader's sympathies. The mere vanity and emptiness of high profession, the collapse of opinion before the respectable temptations of life, and the revelations of character which a new state of things brings about, find a happy illustration, and he is ready to believe with the writer in the probable admixture of very inferior elements, as well as mere illusions of conceit and ignorance, in many a case which has the air of noble self-renunciation. In the present story the mere attempt at self-sacrifice is demoralizing. Deliberate devotion to a public cause involving personal ill consequences is apt, no doubt, to interfere with a graceful performance of the social duties; but seldom has fiction shown such a havoc of them as follows when the hero offers himself a victim to the cause of equality and the rights of man. We are disposed to think that the author, amused with her task, and in full swing of illustration, has overstepped her intention, and miscalculated the effect of the portrait upon the reader. She has drawn a disagreeable character with some truth, but apparently she does not know how disagreeable the fellow is whom she draws, how utterly beyond the most indulgent toleration. She thinks she is describing the mere wilfulness of youth throwing itself into new ideas, and expects her readers to see a good side which he never shows. While he is constantly surly, bearish, selfish, undutiful, even to brutality, he is the idol of his mother and sister, and of Dolly, the young lady who presumes to be in love with him, and we are expected to see with their eyes as well as our own. But an aristocratic air which seems to give the lie to his political convictions does not really atone for the savagery of his manners. Paul is not a gentleman living in an illusion and playing with Chartism; he is not a gentleman at all, nor a man in any proper sense.

The scene of his first appearance is in the author's bright and pleasant, though somewhat conventional, manner. As usual with her, a careful description of house, room, and surroundings introduces us to a cheerful family group. A beautiful mother, a pretty daughter and children, complete a picture made up of life, light, warmth, grace of motion, and general domestic comfort; upon which the hero breaks as the disturbing element—also an arrangement of effects with which this writer makes us familiar. The father, Sir William Markham, is absent in London on his official duties. Paul, who has been professedly staying up in Oxford during the Long Vacation to read, does not appear alone. With him comes a strange figure, a being of a description altogether out of the range of general experience. The little girls see in him a likeness, in appearance and get-up, to the man who comes periodically to wind up the clocks. The boys have darker suspicions. Paul introduces him to his mother abruptly. "This is Spears, mamma. This is a man to whom I owe more than to all the dons put together. You ought to be proud to see him in your house." This Spears is a popular agitator, of such strong convictions that he might seem at first sight to contradict what we have been saying. He is clearly a favourite with the author, but not the less does she expose the self-deception which puts his sacrifices to a cause on another basis than that assumed by himself. The adoring mother cannot be otherwise than gracious to her son's friend thus commended, but she is altogether in a maze. Easily bewildered, like so many of our author's fair women, she is very sweet and unassuming, but ignorant of any class except her own, in which she is a leader. She is giving directions about his room, which Spears hears and interposes:—

"A small room is no matter to me. I'm not used to anything different. In such a career as mine we're glad to get shelter anywhere." He laughed as he spoke of his career. What was his career? He looked as if he expected her to know. Lady Markham concealed her perplexity by a little bow.

She tenderly reproaches her son for having written so little lately, "You boys are so unsatisfactory." His last letter had been from Yorkshire. What friends had he seen there?

"I was nowhere that you know of, at least," said Paul; "I was with Spears, holding meetings. We went from one end of the county to another. I can't tell you where we went; it would be harder to say where we did not go." . . "We saw a great many Yorkshire people; but I go where I am called," said the stranger, "not only where there are people I know." Seen in the full light, there was nothing repulsive or disagreeable about the man . . . . he sat a little uneasily upon the sofa where he had placed himself. His speech was unembarrassed, but nothing else about him. He was out of place. To see him there in the midst of this family it was as if he had dropped from another planet; he did not seem to belong to the same species. But his speech was easy enough, though nothing else; he had a fine melodious voice, and he seemed to like to use it.

"I hope we did good work there," he said; "not, perhaps, of a kind that you would admire, my lady, but from my point of view excellent work; and Markham, though he is a young aristocrat, was of great use. An enthusiast is always a valuable auxiliary. I do not know when I have made a more successful round. It has taken me just a week."

Paul has brought this Trade-Union delegate to his home in the absence of his father. When Sir William comes to hear of it he is naturally indignant, and angrily reproves his son for bringing a notorious paid agitator to his house. A stormy scene follows. Paul defends his friend in stilted language, and defies his father, whose last words are, "This must be put a stop to. When the house is his he can dishonour it if he likes, but in the meantime the house is mine." Then Paul acts out the first part of the proverb:—

"Certainly the house is yours, sir," cried his son. "I make no claim on it. I feel no right to it. Let me alone, Alice! Do I want the house or the land, or the money, which we steal from the poor to make ourselves splendid while our fellow-creatures are starving? I am ready to give it up at a moment's notice. It wounds my conscience, restrains my action. I want nothing with your house, sir. If I may not bring an honest man into it, you may hand it over to any one you please. It is no home for me."

Now, of course, is the time for the son in Barbadoes to turn up. He is heralded by a military couple, husband and wife, who are very much like a good many other instruments of fate in Mrs. Oliphant's novels. The lady, who strikes the first note of disturbance on Sir William—who, strange to say, had hitherto had "no skeleton in his closet"—appears upon the scene in the "old and lumbering" village fly, having come from London in the same train with him. It illustrates the headlong speed of our author's pen that although Sir William is drawn by ponies that, we are told, fly like the wind, and is driven with impetuous energy by his daughter, yet he never outstrips the old and lumbering fly. Whenever Alice's head turns there is the woman in the pink bonnet that first excited her curiosity, within sight, and driving in at the park gates after them. The truth is, the author has characteristic epithets ever ready to enrich and give point to her style; but they are not really composed for the occasion. We find the difference where thought is really present, and the scene has its proper grasp of eye and mind. The most original character in the story is the Barbadoes son, the real heir, in whom of course nobody believes, but who holds his own with an amiable stolidity and imperturbableness which are amusing and not unnatural under the circumstances. The scenes of the death and funeral of his father, in which he plays the leading part, are the best in the book. The writer here gathers herself together, and makes a successful effort.

Paul keeps his character to the last. He had steadily resisted all his mother's and sister's imploring appeals to come to his father's deathbed, choosing not to believe in the urgency. We are to suppose some qualms of compunction when he finds his father dying; but the author, true to her idea, takes care not to make his remorse too poignant. On the day of the funeral he had so far outlived regrets for not having been as good a son as he ought to have been that he could console himself for having at least done his duty at the last by arriving in time, while "his heart, filled with a languid yet intense consciousness, beat softly with a sense of unbounded opening and expansion to new possibilities," upon realizing the sense of possession of a fine estate:—

He was no longer the same being; the moody, viewy, rebellious young man, who was about to emigrate with Spears, to join a little rude community of colonists and work with his hands for his daily bread, and sacrifice all his better knowledge, all the culture of a higher social caste, to rough equality and primitive justice, had died with Sir William. All that seemed to be years behind him. . . . This was how Paul felt. He was not glad; but there was in his veins a curious elation, expansion, a rising tide of new life.

While the author paints with what might seem cynical touches a character thus centred in self, she is nevertheless indulgent. Paul merely personates the high-flying wilfulness of youth and the vanity of committing oneself to a line of high profession. She is careful to break his fall, and the reader is left quite at ease about his future. He is rid of Spears and Spears's daughter, engaged to Dolly, and with a good hope of title and estates in the end, as Sir Augustus resigns himself to a single life, and takes himself off to Barbadoes.

On one thing our author is to be complimented; she allows to her own sex a higher capacity for self-devotion than to man, as well as a more constant and natural demand upon it. It is indeed tempered by a large infusion of helplessness and folly; but we may observe that reflections on human nature tending to contemptuous disparagement belong necessarily to haste. It is the readiest way for an author to show familiarity with his subject. An impression, for example, of old age can be more readily produced by making an old man "mumble and cackle" and run his words one into another, than by tenderer indications; but it strikes us that there is a want of reverence in the method when recourse is often had to it, as in these volumes. When a statesman is shown by his weaknesses alone, and a mother by her unreasonable endurance and indulgence, the same effect is produced.

COBBETT'S ENGLISH GRAMMAR.*

When this reprint of Cobbett's *English Grammar* came into our hands, we at once turned to the end to see if it included that prospectus, so delightful in its complacent self-confidence, in which Cobbett set forth the merits of his own works. "When I am asked," he begins, "what books a young man or young woman ought to read, I always answer, Let him or her read *all* the books that I have written. This does, it will doubtless be said, *smell of the shop*. No matter. It is what I recommended; and experience has taught me that it is my duty to give the recommendation." We fear this inimitable production is becoming scarce. Out of nine editions of the *English Grammar* in the Library of the British Museum, one only—that of 1840—contains it. We ourselves were once the possessors of a copy, appended to Anne Cobbett's edition of 1836; but in an evil hour

---

* *A Grammar of the English Language, in a Series of Letters; intended for the use of Schools and of Young Persons in general, but more especially for the use of Soldiers, Sailors, Apprentices, and Plough-boys.* By William Cobbett. *To which are added, Six Lessons, intended to prevent Statesmen from using False Grammar, and from Writing in an Awkward Manner.* New Edition, carefully Annotated. London: Ward, Lock, & Co.

we lent our Grammar to a friend, and when it came back the prospectus had disappeared. Whether it was stolen by some collector, or whether the book had passed through the hands of some ignorant repairer of bindings who had taken the advertisements out as surplusage, we never could discover.

We cannot make it seriously a ground of complaint that the publishers have not reproduced this puff of Cobbett's. For aught we know, the law of copyright may stand in the way; and moreover, other people besides the late M.P. for Oldham have shops, and the space is now occupied by Messrs. Ward, Lock, and Co.'s own catalogue. The inferiority of the type of the reprint to that used by Anne Cobbett must be held to be to some extent compensated for by the lowness of the price, this being, we believe, a shilling volume, whereas the old editions were published at three shillings. But we really think that the crowded type used for the quotations in the "Six Lessons"—quotations which must be read with minute attention if the pupil is to derive any benefit from the remarks upon them—is unworthy of a house which has published a treatise on "Eyesight, and how to care for it."

The Grammar, as our readers probably know, is in the form of letters addressed to "My dear little James"—Cobbett's third son, then fourteen. "I made him," says the fond parent and proud author, "*copy the whole of it* before it went to press; and that made him *a grammarian at once*; and how able an one it made him will be seen by his own Grammar of the ITALIAN LANGUAGE, his RIDE IN FRANCE, and his TOUR IN ITALY." We must own that we have never examined the works of Mr. James Paul Cobbett to see how far they bear out the assertions of his parent. Critical research has discovered that Cobbett's own writings will by no means always stand the tests which he applied to those of other people. Nevertheless we think that, despite its many faults and shortcomings, the Grammar was not so much overpraised by its author. The great fault which runs through it—the entire absence of any historical or philological knowledge of our language—was doubtless in its author's eyes no fault. Of the latter subject, indeed, he proclaimed his scorn:—"I will not, my dear James, in imitation of the learned doctors, pester you with a philological examination into the origin and properties of words." To inquire into the composition of words was "for monks and for Fellows of English Colleges, who live by the sweat of other people's brows." Deficiencies in historical and philological knowledge were probably not so glaringly visible to people early in this century as they are to us now; but the Grammar had another defect, manifest to the most simple-minded. Cobbett complained, or rather vaunted, that both this and his French Grammar were

> kept out of *schools*, owing to the *fear* that the masters and mistresses have of being looked upon as COBBETTITES. So much the worse for the children of the stupid brutes who are the *cause* of this fear, which *sensible* people laugh at, and avail themselves of the advantages tendered to them in the books.

Looking over the Grammar, it is not hard to understand the feelings of the masters and mistresses, nay, even of the stupid brutes of parents. The edition of 1819 was dedicated to "Mr. Benbow, Shoemaker, of Manchester," whose especial merit was that he had been "shut up in an English Dungeon by order of Lord Sidmouth." After 1820 this was replaced by a flaming dedication to the popular heroine, Queen Caroline, "who, amongst all the Royal Personages of the present age, is the only one that appears to have justly estimated the value of The People." Borough-tyrants, dungeons, axes, seat-sellers, seat-buyers—more mysterious still, the Tyrant and the Spy—are made to do duty in illustrating the objective case or the subjunctive mood. Of one faulty sentence Cobbett says, "This is House-of-Commons language. Avoid it as you would avoid all the rest of their doings." When he falls foul of the anomalous Latinized idiom of "than whom," for which Milton seems to be originally answerable, he remarks, "It is a very common parliament-house phrase, and therefore presumptively *corrupt*." When he gives examples of nouns of multitude, he maliciously strings them together thus:—"Such as *Mob, Parliament, Rabble, House of Commons, Regiment, Court of King's Bench, Den of Thieves*, and the like." "Poh!" he elsewhere remarks, "never think a man either learned or good, merely on account of his being called a Doctor." "These are your *college* and *university* bred men!" he exclaims, after having convicted Bishop Tomline of the offence of wrong placing of words. Lord Castlereagh is dismissed with "What do you say, what can you say, of such a man, but that nature might have made him for a valet, for a strolling player, and possibly for an auctioneer; but never for a Secretary of State? Yet this man was *educated* at the *University of Cambridge!*" Worse even than "the nonsense of Castlereagh" is "the miserable stuff" of the Duke of Wellington, in which "all is vulgar, all clumsy, all dull, all torpid inanity." Apart, moreover, from these political amenities, the Grammar, as indeed is admitted in the preface which "J. M." has supplied to this edition, can never have been suitable for a class-book. Though Cobbett placed on the title-page "Intended for the use of schools," the addition, "but more especially for the use of soldiers, sailors, apprentices, and plough-boys" shows that he had in his eye young men who might be educating themselves, as he had educated himself when he was a private soldier at sixpence a day, when he studied by firelight, and stinted himself of food to save a few pence for pen, ink, and paper. And by thus teaching himself, Cobbett learned how to teach others. His teaching, whatever its value, was of the sort to stick by the pupil for ever. "Thousands upon thousands of young men," he boasts, "have been made correct writers by it. . . . It is a book of *principles*, clearly laid down; and when once these are got into the mind they never quit it." It is not easy to see that Cobbett's Grammar was more than any other "a book of principles"; he took the rules as he found them, and his superiority lies simply in the clearness of his explanations and examples; but, allowing for a little exaggeration in the "thousands upon thousands," there is no difficulty in believing the rest. Even the irreverence with which he drew his "awful examples" from the august productions of princes and statesmen was not without its use. We have nowadays become resigned to bad grammar in a Royal Speech, and we consider diplomatists as entitled to the use of a mysterious jargon peculiar to their craft. But in Cobbett's days criticism of one's betters had still something audacious and startling in it; and the pupil probably remembered it longer than he would if the victim had been some shadowy Caius or Balbus.

As, however, Cobbett is as decided and impressive when he is in the wrong as when he is in the right, his work, if it is to be useful to learners of the present day, should be annotated by a grammarian of the modern school. The frequency of its political allusions demands in addition an historical commentator. In the present edition an attempt is made to supply the latter need; and, considering the size and style of the reprint, perhaps as much has been done in elucidating the political allusions as we could expect. An index, which was much wanted, has also been appended. The historical notes seem good as far as they go; some information has been given about Cobbett himself, about the statesmen whom he so savagely attacked, and the authors whom he criticized; the names, dates of publication, and so forth, of the books quoted have been supplied. "Oliver, the spy," is, however, left in his obscurity, and no explanation is offered as to the nature of a "borough-tyrant," a creature with whom young readers of the present day are not likely to be familiar. "The cruel dungeon-bill," too, might with advantage have had a note. In the preface the editor does not profess to have undertaken more than the clearing up of references which time has rendered obscure; but we find that in a few instances he has offered a little criticism upon his author. He has set him right as to the number of Falstaff's men in buckram; he has pointed out that Cobbett was not the only man who had discovered that Lindley Murray fell short of perfection; and he has given some examples from Shakspeare of the application of the relative *which* to persons, where we should now use *who*. It is characteristic of Cobbett that, though he himself cited the example in the Lord's Prayer, and though he admitted that the present restriction of *which* is modern, he still could not help treating the ancient usage as something actually erroneous. "In the American Liturgy this error has been corrected." So, when he condemned *correspondencies* and *conveniencies* as erroneously formed plurals, it never seems to have occurred to him that there had once been such words as *correspondency* and *conveniency*, of which the plural had lingered on after the singular had given way to *correspondence* and *convenience*. On this passage the editor has made no comment; but, in reference to Cobbett's fashion of writing "blowed" for "blown," he remarks that "in the use of language . . . . we must go with the stream." The remark is reasonable; but he does not point out the fallacy which lay at the root of Cobbett's preference for "blowed"—the notion that the so-called "regular" verbs were the normal type to which all, as far as possible, should be made to conform. Cobbett actually thought that such "strong" forms as *hung, swung*, were to be accounted for by the "mischievous habit" of abbreviation. "Many of these verbs, by being very difficult to contract, have, as in the case of *to hang, to swing*, and the like, reduced the shorteners to the necessity of changing almost all the letters of the words." It is curious that Cobbett's ear should not have appreciated the beauty and force of the vowel-change in a "strong verb"; but, independent-minded as he was, he was enthralled by the terms "regular" and "irregular." Had the regular verbs been presented to him under their modern epithet of "weak," he would probably have turned from them with scorn, and have transferred his affections to the strong forms. It is in this matter of regular and irregular verbs that the Grammar most urgently needs a commentator acquainted with the growth of the English language and with the modern theory of strong and weak verbs; and here the editor has not attempted to do anything. While on this subject we cannot resist the temptation of recording a tradition which lingers in a Northern seaport concerning one of its mayors, who in his early days had been actively engaged in the whaling trade. The worthy man was once beguiled to recount among his experiences a thrilling tale of a boat pursued by a white bear. Firearms the crew had none; but at the agonizing moment when the bear was grappling the boat's side with his mighty paws, a valiant man snatched up a harpoon and drove it into the monster, "He squoke and he dove." Strong verbs not having then become the admiration of grammarians, this climax caused the Mayor thenceforth to be an object of ridicule to the more genteel of his townsmen. Modern philologists, who consider with Grimm that the strong præterites are "eine Haupt-schönheit" of the Teutonic languages, will, we trust, better appreciate him.

Had we the task of advising "a young man or young wo[illegible] we should recommend him or her not to take Cobbett f[illegible] sole guide, but to correct him by the light of some mo[illegible] With authority, such as Dr. Morris's *Primer of English Gram*[illegible]rivalled such precaution, Cobbett may safely be studied, as [illegible]ve all, as in the power of clear and simple exposition, ar[illegible]es, common-teaching both by precept and example a plain, [illegible]

sense style, too rare in these days of fine writing. Especially worthy of attention are his remarks as to wrong placing of words, a fault which is as common now as it was then, and which indeed is so hard to be avoided that a man who can get through so much as a column of print without being guilty of it may—to use a phrase of Dr. Blair's at which Cobbett scoffed—"esteem himself happy."

THE TWO DREAMERS.*

THOSE readers who are willing to put probability entirely on one side, and who are contented if only the plot of a story is striking and new, may perhaps be much interested in Mr. Saunders's novel. If, however, they ask in addition that the action shall be rapid, and that they shall not be kept needlessly waiting by the fineness of the author's language, we can readily believe that they will not get even into the second volume. Our author is, we must admit, free from one of the worst faults of his fellow-novelists. Though he delights in a somewhat stilted style, nevertheless he is well aware that words do still bear a certain meaning of their own. He does not pick them up at random, and thrust them by chance into his sentences, as the diver for pearls snatches at the oysters at the bottom of the sea, and thrusts them into his bag without knowing whether they are worthless or not. Once, indeed, he falls into a blunder which we cannot pass over. He represents a young solicitor about the year 1862 talking of a London merchant who had "gone deeply into the blockade-breaking business." He makes him say, "The British merchant ought to be ashamed of descending to the level of the British smuggler. But, if he isn't, I am not going to attempt his reformation in an æsthetical point of view." What is here meant we do not in the least understand. Had, however, the author put these words into the mouth of any young man, whether a solicitor or not, who was speaking at this present time, we should have passed them over in silence. They would have been in keeping, for young men certainly often do speak of "an æsthetical point of view" when they have no point of view at all. But eighteen years ago "æsthetical" had not got down to the solicitors. It was not even used by the barristers, while in society, had it ever ventured to intrude itself there, it would have been looked upon with great suspicion. It had about it a strong flavour of Bohemia, and, like a short pipe and long hair and a threadbare coat, was considered to be a mark of a struggling poet or painter. We might also say that neither in St. Paul's Churchyard, nor in Regent Street, nor even in the pages of any female novelist, was in the year 1862 "the shimmering silk" to be seen in which the heroine is introduced to us. A little more true perhaps to nature as it was in those days is the bridal dress of white silk in all its lustrous beauty which we read of in the third volume. It will be admitted, however, that a writer has indeed been moderate in his treatment of language against whom no rougher usage can be adduced than this. Whether this moderate and fair conduct in dealing with words, above all in dealing with adjectives, will be any recommendation to those who frequent our circulating libraries we greatly doubt. Mr. Saunders must fall back on his plot and on his scenes. If the one is dragged out and the others are put on the stage rather slowly, at all events they afford a certain novelty and—to use a word of the theatrical critic of a past age—not a little bustle.

The story opens at a somewhat remote period. In the first chapter we are introduced to the hero's mother when she was a little girl. The heroine's mother is, happily, of no importance. Of her we are merely told, and that quite incidentally, that, when on earth, she had been fond of white violets. The hero's maternal grandfather was a judge in India. His only daughter, a lovely girl of seventeen, he had sent over to Scotland under the care of a Mrs. Elphinstone. The young lady fell in love with a poor painter and secretly married him. Shortly afterwards her father wrote to say that he himself was on the point of returning to England, and that a peerage was at his disposal, if he chose to accept it. "The title," he said in words that would well befit a judge on the stage, "has been long in abeyance among certain ladies, my relatives; but, it seems, can now be determined in my behalf." For his own sake he would, he adds, refuse the bauble, but he has a daughter and she may marry. "When she is once happily settled in marriage I may," he writes, "in hope of a grandson, try whether I like the coronet as well as a hat for occasional use." The daughter is at first delighted with the prospect before her; "her face coloured with pleasure and became like scarlet as she understood about the peerage." Mrs. Elphinstone at once cut her joy short by reminding her that she had married without her father's consent. As soon as he should learn what she had done, he was sure, they both knew only too well, to refuse the peerage and to disown her. It was, indeed, a hard case—the certainty [illegible] a future peerage lost, and nothing but a husband—a marvel-[illegible] poor one too—gained. It seems, by the way, to be all [illegible] assumed by the author and his characters that a peerage [illegible] has been long in abeyance among ladies, when it is at dea[illegible] "determined in behalf" of a man, will, on his death, appear[illegible] his daughter. Matters have certainly a very gloomy [illegible] the lovely girl. Most fortunately her marriage was only known to two people, who could be trusted, and her husband fell ill. She neglected him, and he, being of a poor constitution and, moreover, greatly in the way, died of grief. Even now she was not out of danger, for she gave birth to a son. She induced Mrs. Elphinstone to adopt the child, and to take it to Australia. "Magnificent steamers," by the way, as the author ought surely to know, did not run to Australia forty years ago. They add, no doubt, something to the dignity of an heroic baby when setting out on his travels; but the facts of history must not be so violently outraged even for a hero. But to return to the unnatural mother. Her father had no suspicion of what had happened, and on his arrival he at once introduced her to the society that befitted the daughter of one in whose behalf a peerage was so soon to be determined. He had inherited a house in Eccleston Square. His fortune was, he supposed, about a hundred and forty or a hundred and fifty thousand pounds, and "the interest and rents accruing amounted to above eight thousand a year." It is not easy to reconcile the amount of his fortune with the income it produced. The one seems too small or the other too great. Be that as it may, his wealth and her good looks attracted a great deal of attention. He accompanied her everywhere; "his fine chivalric figure and stern look contrasting with the daughter's superb beauty." As they passed in the Row, "there was a low buzz of voices from the loungers at the rail, which indicated their consciousness of a new sensation." She was presented at Court, and became the cynosure of all eyes. Rich heirs began to seek introductions to her. No duke, we are told, offered; but a gentleman, who might become a marquess, seemed a good deal fascinated by her. Suddenly he withdrew. Next came a gallant soldier of high rank. Age was, indeed, against him, for, though he looked little more than forty, he was not much short of fifty. Nevertheless no objection was made to him on the score of age. He, however, withdrew as suddenly as the gentleman who might become a marquess. The Judge was puzzled. At length he learnt from a friend that "there was floating about some vague idea that Miss Keith and her late companion had not been quite circumspect in their conduct." Nothing "tangible," however, was known. The Judge at once lowered his pretensions, and accepted as a husband for his daughter Mr. Senguin, a young London merchant. At the same time he refused the offer of the peerage, so that, for all we know, it still continues in abeyance among his lady relatives. He drew up his will and settled the whole of his property upon his daughter, in trust for her eldest son born in wedlock, when of age. With no small consideration for all the purposes of an interesting plot, he refused to mention in his will his daughter's married name or her husband's. Shortly afterwards he died. She, to guard herself against any future discovery, had told Mr. Senguin of her first marriage, but had assured him that her child was dead.

Here, then, as the reader will at once see, we have the materials provided for some most interesting scenes. Nothing, however, can be done till the hero is of age; and so the author most considerately carries us in a few pages over the next twenty-one years. The child had found a good friend in Australia, who had adopted him, giving him his name, and had left him a large fortune. We are introduced to the young hero, whom we had taken leave of as a baby, under the name of John Claude Hamilton. Mrs. Elphinstone, whom he had looked upon as his mother, had meanwhile died, but she had left him in writing a full account of his birth. She had ended the narrative by saying:—"This I know, that your father's wrongs cry to you from the grave—that you will not listen to them in silence." It was to avenge these wrongs, and at the same time to reform his mother, that the young man returned to England. Without any difficulty he managed to get invited to Mr. Senguin's house, and there was soon established as a permanent guest. His unnatural mother half suspected who he was, and tried to persuade her husband to send him away. It was in vain, for he had borrowed ten thousand pounds of his young friend, and was by no means able to return the loan. He had been a widower when he had married the Judge's daughter, and the child of his former marriage was at home when Hamilton paid his visit. With her he at once falls in love; but his duty to his dead father somehow or other forces him to conceal his passion. He even consents that his bosom friend Mr. Shand, the solicitor who looks at matters in an æsthetical point of view, shall fall in love with her. The solicitor on one occasion fixes on her "a respectful gaze," but it is all to no purpose. She will not have him. The hero is once cruel enough, when she reminds him that she is not his sister, to exclaim, "No; would you were!" It is not at all surprising to find her later on engaged to an elderly baronet for whom she has no affection. But what could the poor girl do? The man she loves wishes she were his sister; at least he says he does. Her father, the eminent London merchant, had become so involved in his speculations that, unless he could raise more money, he must fail; while the elderly baronet was ready to advance him a hundred thousand pounds on the day his daughter gave him her hand. The unnatural mother was, if it were possible, in even a worse plight. She has discovered in the hero her son. She believes that he is implacable, and that his aim is to prove his legitimacy and to claim his grandfather's property. To add to the confusion, she had had a most easy set of trustees, who had allowed her and her husband to draw on the trust property to the amount of seventy-seven thousand pounds. This was certainly somewhat imprudent in these gentlemen, considering that at this time she was only forty-one years of age, and that, if she

* *The Two* [illegible]*ers.* A Novel. By John Saunders, Author of "Abel Drake's [illegible]" "Hirell," "Israel Mort, Overman," &c. 3 vols. London: Chapman [illegible] 1880.

had a son, the property was to pass to him. In her embarrassment "she became a victim to that strangest, but most real, of mental diseases—the one-thought disease." Her one thought at this time was to poison her son. She suddenly repents as she is on the point of giving him the draught, and tries to drink it herself. He knocks the glass out of her hands; and, in a sort of hissing whisper, asks whether the water was poisoned. She throws herself at his feet, and he clasps her as she kneels. However, this scene is found only in the second volume; and there is a great deal more for both of them to go through. She was by no means brought to a proper degree of penitence. His identity had meanwhile been established beyond a doubt, for his old Scotch nurse had found the strawberry-mark—no, it was two little moles—on his right arm.

Matters begin to advance rapidly. The hero gets his leg crushed; and, at a certain period of a story, a crushed leg is very conducive to action. Mr. Senguin's embarrassments increase at a prodigious rate; so that, while his liabilities were above seven hundred thousand pounds, his assets were below three hundred thousand. The Baronet is accepted; and the hero, whose leg was healed, starts for the Continent. The night before the day fixed for the marriage had come, and there was a party given in the bride's house. It was honoured by the presence of a stately dowager Countess. On a sudden two uninvited guests appear. They were not even in evening dress, and their boots were splashed with mud. Mrs. Senguin gave a low scream, and even the stately dowager Countess rose in alarm. The new comers were Hamilton and the æsthetical solicitor. The hero made a speech that fills some pages. When he claimed Mrs. Senguin as his mother, "people started, began to murmur to each other, and to gesticulate violently." Other speeches are made, and at last the scene is brought to an end by a very graceful one from the Baronet. Whether the lustrous white silk dress was worn the next morning, whether the heroine became Lady Arncliffe, whether the wicked mother at last really repented, wheth er the hero and the æsthetical solicitor both remained single for the rest of their lives, that can be learnt from the third volume of Mr. Saunders's novel. Whatever merit his story has lies in its plot, and we must leave part of it untold, so that there may be something left to excite the reader's curiosity.

CHRISTMAS BOOKS.

VI.

IN spite of Miss Greenaway and of her imitators, we think that the prettiest of all child's books is still *Child's Play, Old and New* (E. V. B. Sampson Low and Co.) The first edition of *Child's Play* is an old book now, and probably clean untorn copies are rare enough. The drawings "have all been reduced to a much smaller size," says the author, "by a wonderful process of electrotyping." E. V. B. has added other little sketches, and, though we have no great love for processes of electrotyping, we think that the poetical character of E. V. B.'s drawings puts her volume beyond the reach of rivalry. Since Stothard and Blake, we do not know that any one has reproduced with so certain a pencil the poetry of childhood. The drawing may not always be absolutely correct, but the sentiment, the feeling are true and strong, devoid of small prettinesses and feeble ecstasies. Tony, the "ten o'clock scholar" (p. 8), trudging on his little bare feet to school, is pleasantly humorous, and Thackeray, who drew children with great enjoyment, would have been proud of the sketch of "Annie and Minnie and Sam," with their breakfast of raspberry jam. There is a pretty group of children reading in "Cuckoo, Cherry-tree" (p. 19); but we could wish the lover of "Curly-locks" (p. 22) a more winsome lady. The design called "My Lady's Daughter," with the queen beside the well and the old château in the distance, is full of the spirit of romance, and there is much innocent and pious imagination in the vision of "Five Angels round my Bed." The "Beggars coming to Town" is a page torn from the life of long ago. The gipsy-like beggars drive their asses across the bridge where children watch the running water. The gate-tower interrupts a view of distant hills, and just within the arch there is a glimpse of a steep-roofed house of the good town. There is another pleasant drawing, full of the air of Italy, called "Here we come a piping"; but, indeed, every page has its little masterpiece, and we can only spare space to praise an old friend, the sketch of the home-sick girl, and the deer-hound, her comforter, that illustrates "Oh that I were where I would be." The verses in the book, being chiefly old nursery rhymes, are better than the trash of some modern nursery rhymesters. There is also a pretty adaptation of the "Swallow Song" of Rhodes.

The Sculptor caught Napping (Designs by Jane E. Cook. Autotype Fine Art Company) is the second edition of a graceful book. Mrs. Cook is unrivalled in black silhouettes of little Loves, playing with Pompeian grace, with flowers and toys. A romantic shepherd, dressed like Mr. Irving in the *Corsican Brothers*, leans piping against a tree, and the lambs dance as in the Theocritean idyl. The fable of the Queen of Hearts is illustrated in this style, but "Jack and Jill" are too artificial young people. The pretty maid who went a milking is very graceful, and so is her rural swain. On the whole, this Christmas book deserves its popularity.

Some Drawings of Ancient Embroidery (Mrs. Mary Barker. Sotheran and Co.) deserves a more learned notice than it can at present receive. The coloured designs are chiefly from old English ecclesiastical needlework. As the author observes, "These examples should be studied by persons who wish to . . . revive church embroidery." The earliest work seems to be the finest and best; but in the fourteenth and fifteenth centuries floss silk and gold give much splendour to the fabrics. Great ingenuity is shown in the filling up of spaces with decorative scrolls and sprays, and angels, *fleurs-de-lis*, double-headed eagles, and conventional flowers are the most usual ornaments. Mrs. Barker holds that modern embroiderers are not likely to effect much by attempting to invent many new ornaments. The examples she has copied are from collections at Cirencester, Corby Castle, Buckland Church in Gloucestershire, and other places. The first plate represents a very Byzantine crucifixion. Angels catch in silver chalices the blood from the hands of our Lord. The design of the First Person of the Trinity is a hideous and, if revived to-day, would be justly deemed a blasphemous, caricature. In the third plate, the angel carrying the soul of a departed saint shows how art declines, and the angel is a strange degeneration from the Harpies of the Harpy tomb. The purely conventional designs, such as the flowers (plate 4) are beautiful enough, as are the little blossoms springing at the foot of the cross (plate 5). In decadent as in nascent art, the human figure is excessively ill-drawn. We see no reason why modern embroiderers should imitate the faults of their mediæval predecessors. Mrs. Barker's work as a copyist deserves high praise; colour and texture are wonderfully well rendered in her plates, and the book is a beautiful one, of unusual historical and artistic value. Still, we hope that enthusiasts into whose hands it may fall will not decorate churches with repetitions of the blunders of the old pious artists.

The Great Historic Galleries of England (Edited by Lord Ronald Gower. Sampson Low and Co.) charms us at at once with a photograph of Holbein's beautiful lady, Christina of Denmark. No one who has fallen in love with her at the Exhibition of Old Masters is likely to have forgotten this excellent portrait. Sir Joshua's "Caroline, Countess of Carlisle," with a rose in her hand fading as the picture fades, is a dim but beautiful reproduction of the original. Gainsborough's "Housemaid" must have caused pangs of jealousy in the hearts of Gainsborough's plain daughters. The girl, as Lord Ronald Gower says, must be "a princess in disguise, or a Cinderella waiting for her glass slipper." Lord Ronald does not say whether the painting has been engraved; if it has not, we trust that it soon may be. Holbein's "Duke of Norfolk" and Hals's "Portrait of a Cavalier," with Rembrandt's "Portrait of a Lady" in her pearls and lace, are all excellent, and prove that photography is better adapted to the reproduction of portraits than of pictures crowded with figures. Lord Ronald Gower's remarks are brief and to the point.

The Golden Queen: a Tale of Love, War, and Magic (Edward A. Sloane. Griffith and Farran) is "inscribed, by permission, to the Right Hon. William E. Gladstone, M.P., Premier of England, A Man that as an Orator, Patriot, and Scholar, is the pride of his own Countrymen, and the admiration of the World, by his most Humble Servant, the Author." Poor Mr. Gladstone! 'twere better to be Boycotted than dedicated to in this style by Mr. Sloane. In his preface he avers that the most courageous people of the world have undoubtedly been the Indian warriors of North America. We thought the Montenegrins were the most heroic race known to history. The *Golden Queen* is a poem about these North American statesmen and patriots. The verse is often vigorous and musical, and though there are signs of the work of an inexperienced hand, the story "marches" better than do the narratives of some more famous minstrels.

The Little Blue Lady; and other Tales (Elizabeth Harcourt Mitchell. Masters and Co.)—We are glad to be able to say that Mrs. Mitchell has made an immense advance on her last book, so much so that it is difficult to believe that both are the work of one hand. These stories are all interesting in their various ways, and are told well. The one which gives its name to the book is the history of a little Norman girl who is living in Paris in the stormy years before the Revolution, and, being unable to pay the rent of the dwelling-room of herself and her mother, is much tempted by finding a purse containing a large sum, which had been dropped by a young noble riding through the streets. Honesty, however, prevails, and the reader follows Adèle through many adventures till she succeeds in discovering the owner at a *fête* for the poor at Versailles. The other tales are good and original.

Industrial Curiosities (Written and edited by Alexander Hay Japp, LL.D., &c. Marshall and Japp).—Mr. Japp has found out quite a new field, and given a great deal of information which will prove new to most of his readers. He has devoted many pages to tracing out the history of leather, its uses, and the method of its preparation. Not content with treating of leather in general, he examines the various kinds taken from different animals, with the special processes employed in every case. Some of the subjects, such as the Hop Garden and the Post Office, have been treated of many times before, yet even here Mr. Japp has managed to infuse much originality. It cannot be said that the woodcuts materially help the explanations, but these are so clear that they can quite well stand alone.

Great Britain for Little Britons (Eleanor Bulley. Gardner, Darton, and Co.)—Mrs. Bulley calls her book "[illegible] children to read to themselves," but we should be extremely surprised to see any child devote much time to it unless [illegible] to do so as a lesson. The counties are described [illegible] in a scrappy kind of manner, without any syste[illegible]

sort of information being given, and sometimes another. The whole is interspersed with interjectional remarks by the children which are printed in italics. We jump from Cambridgeshire to Gloucestershire, from Somerset to Lincoln; and while we have a fairly sensible account of Bedfordshire and its produce, nearly all the chapter on Surrey is devoted to the story of Essex and the ring. If a few children require to be taught in this way, the greater number are the better for learning their lessons in a serious fashion, and will certainly not profit by the printed remarks of their fellows, real or imaginary.

The Story of the Last Days of Jerusalem (From Josephus. By the Rev. Alfred Church, M.A. Seeley, Jackson, and Co.)—There is always something irresistibly fascinating in any contemplation of the fall of Jerusalem. This partly arises from the way in which we are taught our Bible history, and the consequent feeling, so difficult wholly to get rid of, that the Jews were indeed an isolated nation, living under quite peculiar conditions of time and space. When, therefore, we approach near to the terrible event with which prophecy has made us familiar, it is hard to repress an awe-struck sensation, as if we were indeed standing upon holy ground. Mr. Church's new volume has all the charm of his former ones. It tells the story of this troublous period clearly and plainly, yet in words that bear with them a faint echo of the Scripture prophecy. He follows the account given by that wonderful young doctor who in his learning, statesmanship, and calculation was such a typical Jew; who was ready to fight as long as victory was possible, and, when hope was past, to surrender. We are made to understand the state of the city divided against itself, of the strife of parties which really was the cause of the rapid success of the Romans; and a vivid picture is drawn of the miseries of the famine, not forgetting that most horrible story of the woman who was found eating her own child. Many illustrations are scattered through the book; but these, though good in design, are much disfigured by the deep pink of the men's arms and legs.

Queer Pets and their Doings (Olive Thorne Miller. Shaw).—Miss Miller has shown us how well she can deal with human children, and she seems equally at home with those of a furred and feathered race. She does not disdain anything in the way of information, and tells her stories as if the animals were all personal friends, as perhaps they were. The pictures by Mr. Beard are admirably drawn, and very much to the point.

The Girls of Fairylee (Lettice Lee Oliphant. Anderson and Ferrier) is a moral little tale of no particular merit. It is on the same lines as Miss Edgeworth's stories; but it needs a Miss Edgeworth to keep stories of this kind from lapsing into dulness.

The Guests of Flowers (C. E. Meetkerke. Griffith and Farran).—If the rising generation make use of all the books that are written for them, they will be perfectly informed about natural history. They may learn a great deal from the one before us, which not only deals with plants, but also with insects in relation to plants.

The Yearly Album of *Vanity Fair* ("Vanity Fair" Office) contains a number of portraits, many of them excellent, and some not at all caricatured. All the persons represented are not exactly famous, but probably they were being talked of when their portraits appeared. Jehu Junior is still patting dukes on the back, snubbing Dissenters, giving certificates of gentility, and, in short, behaving as showman in his well-known manner.

Mr. Keene's "Our People" drawings from *Punch* (Bradbury, Agnew, and Co.) are too important for hasty mention in this place, and are noticed elsewhere in our columns.

The *Graphic* Christmas Number is a miracle of cheapness and chromolithography. We cannot agree with critics who think Mr. Millais's picture of a little girl, "Cherry Ripe," a rival of Sir Joshua's "Penelope Boothby." "Cherry Ripe" is, at least, a healthy child. The big coloured picture of the Christmas Number of the *Illustrated London News* (also wonderfully cheap and abundant in works of art) represents a little child who is not healthy. This is atoned for by Miss Greenaway's charming infant armed with a branch of holly. Here, as in the *Graphic*, are stories and verses by eminent hands.

The *Illustrated Sporting and Dramatic News*, in its number called the "Ingle Nook," is more illustrated than sporting or dramatic, which is quite right at Christmas-time.

For *The Corsican Brothers*, which appears to be as attractive as ever at the Lyceum Theatre, Messrs. Marcus Ward and Co. have designed with great skill a handsomely illustrated "Story of the Play," containing coloured plates of the principal scenes. The little work is capitally turned out, and does great credit to its designers.

Here we take leave of cards, crackers, and Christmas books, with the hope that all who write, publish, illustrate, give, or receive them, may enjoy a merry, Christmas, and have skating or hunting, as their tastes may prefer, in abundance. To all reviewers of Christmas books we wish, what the end of the season ought at least to bring, respite from hard labour. Might not convict de[illegible]r, by the way, be utilized in reviewing Christmas books? appear.

FRENCH CHRISTMAS BOOKS.

II.

Les deux mousses (Louis Rousselet. Hachette et Cie), whose adventures M. Rousselet relates are interesting boys to whom "Sahib," who illustrates the book, has done very much less than justice. The book opens with a smuggling adventure, into which the young Daniel Riva of Cette is beguiled by the ruffianly Mateo Puig, and which, being as it is the sequel of other escapades, draws down upon him his father's accumulated wrath, which, however, is diminished by Daniel's gallant conduct at a wreck. Here he rescues a passenger who, in spite of all that is done for him, only lives long enough to confide to Daniel a secret, and to entrust him with a commission, the discharging of which thenceforward becomes the one object of his life. His falling in with a certain Dominique, a kind of honest Iago in low life, leads, by a course of events which young readers will like to find out for themselves, to his finding it necessary to make his way as best he can to Australia, and to this end he engages himself to Captain Goulard of the *Jackson*, "navire américain." On board he finds his brother-*mousse* Pingouin, an exceedingly intelligent and good-humoured boy. The two make friends at once. "Sahib" has given us a picture of their first meeting, in which they eye each other with evil and hideous countenances. Pingouin is evidently only waiting for the captain's back to be turned in order to begin to "make it hot" for the newcomer. This is the only possible interpretation of the picture; but, according to the author, when the boys were left alone together, "le jeune Roussillonnais questionnait Pingouin, qui le mit au courant avec bonne humeur." Captain Goulard is, in his way, quite as charming a person as are the two *mousses*; but curious things happen on board his ship which appear natural enough when the hero and the reader discover at the same time that the captain is really the commander of a celebrated S[illegible] American privateer—the story is laid in the time of the American war—and that the *Jackson* is only carrying its crew out to Cape Bojador in order to meet the swift steamer with which they propose to deal destruction to any Northern ships they may come across. Many exciting incidents and scenes are got, as may be guessed, out of this state of affairs, not the least exciting of which is the end of Captain Goulard and of his swift cruiser. How the "deux mousses" happen to survive and to get carried to Australia; how the infamous Dominique turns up again; how his scheme for their ruin leads to his own; and what is the happy chance that brings everything right at the end, had better be left for readers to find out for themselves. The book is full of hair-breadth 'scapes and of hard-won triumphs of ingenuity and virtue over vice and low cunning. It is, indeed, among the very best of its kind, and is infinitely better than the volume which M. Verne has turned out. It is, perhaps, unlucky that the merit of the drawings is so far inferior to that of the letterpress.

For *Prisonniers dans les glaces* (E. Plon et Cie) M. Georges Fath has provided both the letterpress and the drawings, and both are capital. The book opens at a breakfast which is the occasion for the annual meeting of four school friends, who thus keep up their boyish intimacy in later life. One of them, a rich and adventurous young Russian, proposes to the others to accompany him in his yacht to the Arctic regions, and their acting upon the proposal gives M. Fath an opportunity for employing his pen and pencil upon a never-flagging succession of interesting and stirring scenes. There are storms at sea and on land, moments of agonizing suspense when one longs to skip a few pages, and see if the adventurers got safely out of their trouble, exciting bear-hunts in which sometimes, as in *The Golden Butterfly*, the usual position of bear and hunter is reversed, feats of prowess and endurance of every kind, and, in short, everything that such a book ought to contain. One of the very best told adventures is one which occurs soon after the party have got to their first destination, and in which the invention of the scientific member gets them out of an awkward difficulty caused by four bears who select an inconvenient moment for besieging them in a hut.

M. Lesbazeilles, in *Les merveilles du monde polaire* (Ouvrage illustré de 38 gravures dessinées sur bois par Riou, Grandsire, etc. Hachette et Cie), has produced a volume which may be read advantageously either before or after the one of which we have just spoken. The book is written in an attractive style, is full of interesting matter, and is capitally illustrated. One of the cuts, which represents a floating iceberg, is particularly good. In another, "Navire se défendant contre des ours blancs," it is a little unfortunate that the bears appear to be coal black.

Le pays du soleil (Ch. Deslys et R. Cortambert. Hachette et Cie) takes us straight from the North Pole to the Tropics, where things quite as surprising take place as those which happened to the Arctic voyagers in *Prisonniers dans les glaces*. Some of the scenes towards the end of the book are needlessly painful.

De Paris à Samarkand (Impression de voyage d'une Parisienne. Par Mme. de Ujfalvy-Bourdon. Ouvrage contenant 273 gravures sur bois et cinq cartes. Hachette et Cie) is a wonderfully handsome book, beautifully printed and illustrated, and admirably fitted for a present. How it came into existence is explained by the first few lines:—"C'en est fait! Mon mari, M. de Ujfalvy, chargé par le ministre de l'instruction publique d'une mission en Russie et dans l'Asie centrale, quittera Paris le 10 août 1876. Je suis résolue à le suivre." A foot-note affords instruction as to the proper pronunciation of M. de Ujfalvy's name—

THE NEW YEAR.

TWO high authorities—the German EMPEROR and Lord DERBY—have just made their forecast for the New Year, and their forecast comes to much the same as the forecast of ordinary people, and is to the effect that things look bad, but not very bad. Both the EMPEROR and the EARL start with the comfortable conviction that his country is on the right road if it will only stick to it. The EMPEROR notices with genuine satisfaction the working of the system of repression which has been adopted in Germany. There has already been much wholesome repression exercised, enough to make him proud and grateful, but much more is wanted, and the EMPEROR has a just confidence that what is wanting will be supplied. It is, indeed, an article of which a Government such as that of which he is the head is not likely to run short. The only danger is that the country, which undoubtedly is not seriously averse to it at present, may get tired of it, and so the EMPEROR says a strong word or two to encourage the halting and stimulate the languid. In the same way Lord DERBY speaks of Free-trade. It is by Free-trade that we have become rich; and it is by Free-trade alone that we can remain rich; and all sensible Englishmen must join in constantly suppressing those who are inclined through the [illegible]ness of the times to favour Protection under its new [illegible] of reciprocity. Everything that Lord DERBY said on [illegible] head was [illegible] by his usual good sense; and it [illegible]ld be difficult to add to his review of the causes of [illegible] or alarm [illegible] our general trade. There is no reason [illegible] suppose that, if our trade is conducted on sound principles, England can be beaten in the open competition of the world; but at present our trade is languishing from [illegible] concurrence of causes, such as the investment of too much capital in particular forms of business, adulteration of exported goods, the waste of capital by investment in rotten foreign securities, and the superabundance of labour. For [illegible] of these evils there is an available remedy. The [illegible] of capital invested in business will in times like these soon prove to have been lost, and so there will be a natural end of it. We need not lose our foreign markets by the most disgraceful forms of adulteration unless we please; the public is heartily tired of rotten foreign loans; and a new tide of emigration can take off our surplus labour. Some, again, of the causes of distress are purely accidental calamities. Famines in China and India have impoverished millions of our distant customers, and, as Lord DERBY put it, many an English child has gone supperless to bed because the inhabitants of a remote province in China were perishing from starvation. Special causes like those go as they come, and [illegible] may reasonably hope that they will be conspicuous by [illegible]ir absence in the year that is just beginning.

On two points, however, Lord DERBY's remarks seem [illegible] need a little emendation to make them quite correct; [illegible] they are points closely connected with the prospects [illegible] the year. In order to get back to really good times we [illegible]st have peace, and we must have more self-restraint in [illegible] working classes. Lord DERBY did not say a word [illegible]ut the foreign policy of the Government he has [illegible]ted, but he pointed out in a very strong and marked [illegible]ner the dangerous influence of certain classes of [illegible]ty in the direction of a war, simply that there [illegible] [illegible]ohow be a war. There are, he said, in the first [illegible] military men flushed with the excellence of [illegible] system, anxious to test it practically and growing accustomed to write up their views through the press, and these military men have not only the influence which they themselves possess, but also that which their families command, and the social influence of these families is, in many cases, very considerable. Then there are those, army contractors and so forth, who hope to make private fortunes through a war. Lastly, there are all those who apprehend that their special interests would be endangered if Parliament gave itself to domestic reforms, and who are glad to find the attention of Parliament and of the nation distracted by questions of foreign policy. There can be little doubt that influences in the direction of a war exist in England. There never was a great nation in which they did not exist, and Lord DERBY is perfectly well able to form an estimate of the tone and tendency of high English society, and has been so often and so long Minister, that he cannot be under a delusion as to the pressure to which he has been exposed. But then, if it is assumed, as it must be assumed, that there is such a thing as a just and necessary war, there are other classes who have an undue leaning against all war. Many persons hate all military operations as much as soldiers love them. There is a very much larger number of persons who would suffer in their private fortunes through war than of persons who would gain by it; and if those who fear Parliamentary reforms are glad that the attention of the public should be directed abroad, those who are eager for these reforms detest being baulked of their aims by war, or the rumour of war. Of the two sets of influences, those working for any war that can be got, and those working against all war, the latter are, we think, the more permanently powerful. But the nation as a whole is not guided by either set of influences. It is sometimes in a flurry, and sometimes supine; but as a rule it is averse from war unless it thinks it cannot avoid fighting, and then it will fight. For the New Year good ground for hoping that peace will be maintained is furnished by observing that all other nations happen from various causes to be just now of the same mind as England.

Lord DERBY also discoursed on the thrift, or rather want of thrift, and drunkenness of the lower classes in England, and he went over the old familiar argument that the English people pay to their Government forty millions sterling for duties on intoxicating liquors and tobacco, and that, if they only drank and smoked half as much, they would pay only half as much in the form of taxation. As an arithmetical computation such a statement is beyond criticism. Half the consumption means half the yield of the taxes on what is consumed. But the arithmetical computation is remote from real life. England is a very drunken nation, but if it ceased to be a very drunken nation it would contribute much more than twenty millions to the Exchequer for liquors and tobacco. There is no great good in putting before the working classes an ideal that cannot be attained. If, at the end of a long and useful life, Lord DERBY found that he and others had preached the cause of temperance so well that the revenue from liquors and tobacco had decreased by a fifth instead of a half, much more would have been accomplished than there is at [illegible] reason for expecting. Working men like those [illegible] Lord DERBY addressed at Rochdale are still, [illegible], will continue to be, exceptions to the

rule. But, nevertheless, in estimating our prospects we must take cognizance of the existence of such men, and we must allow that the stern lessons of hard times may make such men more numerous. That they should become more numerous is of much more consequence than that the question which naturally and properly occupied the attention of Sir MICHAEL HICKS-BEACH as to the issue of the next general election should be this way or that. Political parties are a part of our political life, and there can be no objection to a Conservative saying that the Conservatives are sure to win, or to a Liberal saying exactly the contrary. But if ever the day comes when the working classes are better educated, more thrifty, and more abstemious, a party will, it may be guessed, be gradually formed which will not fit precisely into the Conservative or the Liberal groove. On such a party no English statesman is so likely to have a firm hold as Lord DERBY. This is certainly not saying much for his chances of power, but it is saying much for the peculiar turn and temper of his mind.

THE AFGHAN WAR.

WHILE Liberal writers and orators busily prosecute the controversy on the origin of the Afghan war, the actual campaign seems to be almost suspended, probably in consequence of the weather. A part of Sir S. BROWNE'S force is probably by this time in winter quarters at the further end of the Khyber Pass. No explanation has been given of the false report that YAKOOB KHAN had arrived at Jellalabad. The contradiction of the story caused some disappointment; though, if it had been true, the question would still have remained whether he was a ruler anxious to make peace or a fugitive in need of protection. It is strange that nothing is known of SHERE ALI'S relations to his son, of his present place of abode, or of the causes of his departure from Cabul. The most probable conjecture is that YAKOOB KHAN has succeeded to power against the wish of the AMEER; but it is still possible that he may exercise authority in his name. It is of great importance that there should be a settled Government in Afghanistan with which it may be possible to treat. On the other hand, it would be rash hastily to recognize a temporary occupant of the throne, who may at any time relapse into the condition of a pretender. There is nothing improbable in the rumour that SHERE ALI left the capital in company with the members of the Russian Mission. If he claimed the personal protection of the officer in command of the escort, his request could scarcely be refused. If he has left his own dominions, he has probably chosen one of the protected States for his residence in preference to nominally Russian territory. There is no reason to suppose that the last has been heard of a vigorous and ambitious Prince. If YAKOOB KHAN proves or professes to be friendly to England, it may eventually be expedient to recognize him as his father's successor.

The reported definitive annexation by General ROBERTS of the Kuram district requires explanation. It is impossible to suppose that a military officer would perform so grave a political act except under the express orders of the Government; yet the VICEROY has not, as far as is yet known, issued any proclamation on the subject. If the report is confirmed, it must be assumed that the Indian Government had before the beginning of the campaign considered that the annexed district was indispensable in the delineation of a scientific frontier; yet the object might have been attained for the purposes of the present war by military occupation, while questions of territorial acquisition might have been postponed till after the conclusion of peace. Whenever negotiations commence, the ruler of Afghanistan for the time being will endeavour to retain all the dominions which SHERE ALI possessed before the rupture. The partial or total restoration of conquests would be a proper subject of diplomacy; and the Indian Government might at least reject any claim for restitution to which there were sufficient objections. The formal and immediate annexation of the Kuram district, if it has really taken place, ties the hands of the Government, and it can scarcely fail to irritate the Afghan chiefs on whose support YAKOOB KHAN must depend. Still graver irritation will be caused if the Government determines not only to occupy but to keep Candahar. There are conflicting accounts of the strength of the garrison; but there is little doubt that the place can be taken at the recommencement of the campaign, or perhaps even before the army goes into winter quarters. The possession would probably be burdensome, and it would be a serious obstacle to a permanent friendly understanding with the Afghan Government. The late Parliamentary debates and the course of public discussion have proved that the country has no wish to acquire additional territory. Statesmen of all parties have agreed that it is expedient to preserve in Afghanistan a strong and friendly State. It is true that Candahar has been sometimes independent of Cabul; but a division of territory among chiefs belonging to the reigning family is not so inco[illegible]patible with the maintenance of national unity as the [illegible] transfer of a province to English rule. The frontier [illegible]trict which is said to have been already annexed [illegible] possibly not owe undisputed allegiance to the Amee[illegible] CABUL; but it will undoubtedly be claimed as Afghan territory. The explanation of the measure, if it has really been taken, will be awaited with anxiety.

The Government ought to bear in mind that the object of the war has been partially attained. The vigour with which the winter campaign has been conducted indicates the forethought of the Government, and consequently furnishes an answer to the doubts which had been expresse[d] whether Lord LYTTON had chosen the most convenie[nt] time for beginning the war. The successes of the troop[s], and still more the practical proof that the Indian Government was not unprepared for war, had probably some influence over the direct negotiations between England and Russia. Not being ready, or not being inclined to risk a rupture, the Russian Government has of late, as far as it appears, neither urged untenable pretensions nor refused compliance with reasonable demands. The real cause of the war was the ostentatious mission to Cabul, although, as several Ministers lately explained, the technical reason was the refusal to receive an English Envoy. It is certain that, if Sir NEVILLE CHAMBERLAIN had been received at Cabul, his first demand would have been that the Russian Envoy should be dismissed. The presence of the rival mission would have been a continual affront to the representative of England. The use of force was unavoidable if no other means could be found of convincing both the AMEER and the Indian subjects of England that the establishment of Russian influence at Cabul, or even an attempt at Russian interference, would not be endured. The advance of English columns into different portions of Afghan territory has formed the necessary demonstration, and the withdrawal of the Russian Mission serves as a notice that the undertaking made with England a few years ago will henceforth be observed. Mr. GLADSTONE and some other assailants of the Ministry have rashly complained that the assurances of the Russian Government as to the complimentary character of General KAUFMANN'S correspondence were too readily accepted by Lord SALISBURY. Prince GORTCHAKOFF, if he desired to maintain the extreme pretensions of his Government, would probably have preferred the course which Mr. GLA[illegible] recommends to the policy actually pursued by the Government. A profession of disbelief in the Russian Minister's statements, combined with practical acquiescence in the continued residence of the mission at Cabul, would have been at the same time offensive and weak. It is generally a rule of diplomacy to accord ostensible belief to every assertion, but to act on the best judgment which can be formed as to the real facts of the case. It matters little whether Lord SALISBURY, when he was told that the Russian Envoy had left Cabul, was misled into a belief that the mission was withdrawn. The Russian Minister probably intended to convey the impression, although Mr. GLADSTONE, with instinctive love of a quibble, contends that the distinction between an Envoy and a mission ought to have been clearly apprehended. It is more to the purpose to know that the Russian assurance has now become substantially as well as literally true.

The apparent good faith with which Russia is now executing the Treaty of Berlin in Europe affords some security against the renewal of dangerous complications on the Indian frontier. Some time since, when an opposite policy was in favour, Russian journalists were never tired of explaining the necessity of embarrassing England at Cabul for the purpose of extorting concessions in Bulgaria or Roumelia. The abandonment of schemes for disturbing the settlement of Berlin coincides with the re-

sumption of a neutral position in Central Asia. Russian statesmen may perhaps smile at Mr. GLADSTONE'S assertion that an impassable obstacle in the way of their advance to the Indian frontier is created by the establishment of Persian authority at Merv; but the subjects of a despotism scarcely understand the excitement which is produced in a constitutional country by political controversy. There is every reason to believe that, if the Persians occupy Merv, they only hold it for their powerful allies. Englishmen who are not vehement partisans who have no desire to quarrel with Russia, and who are anxious for peace, will at present abstain from blaming the Government for any courtesy which it may have displayed to Russia. They will also watch eagerly for the first opportunity of coming to terms with the Afghans, now that the most serious cause of quarrel is removed. It may be hoped that Lord LYTTON will not insist on the acceptance of an English Resident at Cabul, and also that he will not run the risk of annexing Candahar, or any other important part of the Afghan territory. An early peace concluded after the attainment of the main objects of the war would be more popular than any other act which the Government could perform.

EUROPEAN FINANCE.

THE quarterly return of the English revenue just published may be susceptible of different interpretations. It may be taken to show that the CHANCELLOR of the EXCHEQUER has been justified in his anticipations, or that he has been too sanguine. But the limits of the variation of opinion are narrow. The return cannot possibly be taken to show that there is anything like embarrassment in the present condition of English finance. There is distress in England, and there has been some small extra military expenditure. It is impossible that this distress and this extra military expenditure should not have impaired the financial position of the country. All distress and all increase of taxation for unproductive purposes must in some ways, more or less indirect, and more or less perceptible, make a country worse off. The country may be able to endure them, and even to endure them easily; but all political economy would be wrong unless they were things to be endured, and not things to which a nation could be altogether indifferent. What is clear is that England has been able to endure such an amount of distress as has hitherto prevailed, and such extra military expenditure as has been incurred, with that amount of ease which is indicated by the absence of any serious falling off in any of the main sources of revenue. The same may be said of France. There is much distress in some parts of France; not so much as in England, partly because the manufacturing industries of France are smaller, and partly because French workmen are not quite so prone to quarrel with their bread and butter as English workmen are. In one sense, indeed, the poverty of those who refuse to work at the wages which are all their employers can afford to give them ought to be deducted from the sum of national distress. In England it is the result of a choice as to the mode of living, and expresses a preference for living on a less sum from the poor-rates over living on a greater sum from industry. It is not distress in the sense in which distress is produced by uncontrollable calamity. But for revenue purposes it may be spoken of as distress, since the production of the nation is lessened and the rates are increased. In France, however, the burden of the late war is incomparably greater than the burden imposed by any extra military expenditure that England may now be supporting. That France has to raise at least thirty millions sterling more in taxes to pay for the cost of the war must be a burden the weight of which should not be overlooked simply because it is borne without any great difficulty. That it is so borne may be inferred from the increase under almost all the heads of indirect taxation which the French revenue returns show for the last quarter. Two, therefore, of the great nations of Europe may be said to be in this position—they are going through bad times, but not so that the national revenue is sensibly affected. Unfortunately it is only of two nations that this can be said.

Italy, Austria, and Germany may be classed together in a group, as all being in some kind of financial embarrassment, as all seeking to provide a remedy by the increase of import duties of a protective kind, and as all owing their embarrassment partly to bad times, principally to a military expenditure disproportionate to their resources. How the protective duties work in Italy has been explained in an interesting letter from Mr. WEDGWOOD, in which he shows that the export trade of English earthenware to Italy has been checked, until at last it has been killed off, and the Italians are left to use their own rude crockery. Austria in the recent augmentation of its tariff is seeking three objects—to balance the Budget, to enrich its producers, and to secure a larger portion, if not the whole, of the Levant trade in those articles which are to be produced under the stimulus of Protection. The protectionist proposals of Prince BISMARCK, the chief of which is the imposition of a prohibitory duty on iron, have been referred to the Tariff Committee by the Federal Council, and will soon have to be discussed by the German Parliament. It is impossible to contend on behalf of Free-trade that increased taxes, even if of a protective character, do not answer the immediate purpose for which they are imposed. They bring in money. They enable a Government to meet or to mitigate present embarrassment. The German Government wants more money than it has now for military purposes. If it puts on new taxes it will get more money, and will be able to provide for the vast army it thinks necessary. It was by imposing enormous import duties, some of which were highly protective, that the United States was able to pay off a large part of the debt incurred in the civil war. What is true is that a nation by imposing protective duties mortgages its future. It abandons wealth which it might possess. The ability of Germany to keep up its army will in time be diminished. The nation ought to grow richer with greater speed than will be attained, and it is possible that it may grow actually poorer. Even if the new taxes which must be voted in order to maintain a vast military force were raised from the least objectionable sources that could be devised, they must make the nation poorer; but, if this amount of military force is necessary to the nation, then the amount of increased poverty is also necessary. What Germany will voluntarily add to the loss, if Prince BISMARCK'S proposals are adopted, is the extra diminution of wealth caused by impairing the purchasing powers of the consumer. Prince BISMARCK has, however, recently defended his proposals on a special ground. England can trade with the world, but Germany must trade chiefly with her neighbours. She is surrounded by protectionist neighbours—France, Italy, Austria, and Russia. The nearest approach to Free-trade which she can make with such neighbours is through Treaties of Commerce. But, as these treaties are bargains, a good bargainer must have something to give up. Prince BISMARCK is putting on duties in order to have something to give up when he bargains with his neighbours. This argument is not without force so far as it goes. All Treaties of Commerce are departures from the strict principles of Free-trade. They are at best only modes of getting the idea of Free-trade into heads which would otherwise be impervious to it. If they are looked at as in themselves good and valuable bargains, the bargainer must have something to start with. It is useless to haggle over the exchange of a calf for a donkey, unless the one haggler has got a calf and the other a donkey to haggle about.

Lastly, there is among the Great Powers Russia. Probably, of all the chief nations of Europe, Russia has least felt the prevailing commercial distress, for its commerce is too young to be much hurt. But then its abnormal military expenditure presses on it with extreme weight. What the cost of the war will ultimately prove to have been no one, not even probably the Russian Minister of Finance, can pretend to guess. The estimated cost for 1877, as publicly declared, is somewhat over forty millions sterling. This may or may not be the real cost for that year; but, supposing it is correct, the total cost of the whole war, reckoned to the period when all the Russian troops are brought home and the army is put once more on a peace footing, cannot be taken at less than a hundred millions sterling. This will have to be paid for, and in face of this payment the ordinary revenue is decreasing. The deficit is not easy to express, for it is given in roubles, and the rouble has been so depreciated by paper issues that the proper equivalent in pounds sterling is a matter of guesswork. It may probably be put down at something like four millions. To balance the ordinary Budget new taxes must be imposed. Taxation is already so heavy in Russia, and the Custom duties are so nearly

prohibitive, that the Finance Minister has apparently no other resource but to increase the duty on spirits. The army, it is calculated, when it comes back, will drink handsomely, and the Russian peasant would sell the shirt, if he had one, off his back to get drink, and so the revenue may flourish. It must be owned that, if all that Russia had to think of was to make up a deficit occurring in bad times of four millions, it would be idle to talk of her insolvency. But, then, there is the war expenditure. This will have taken the shape, partly of internal loans, partly of an increased inconvertible currency. Until we know the amount of the two together, and of each separately, it is premature to speculate on their consequences. But it is also premature to speak as if Russia must have to proclaim herself insolvent. She will have to pay the bill she has run up; but, considering her recovery from the Crimean war, it may be taken as possible that she should pay it. The interest on the internal loans will not be a very heavy charge, and an increase of the inconvertible currency causes much misery and deranges dealings with foreign nations, but it need not involve national ruin. Its effects all depend on its quantity, and on the probability that no further increase will be made. The issue of caimés has brought Turkey into the most woful insolvency, but these caimés have been issued almost at random, and no one believes that the supply of them will cease. The issue of a given number of millions of inconvertible currency in Russia must ruin many individuals, cause much distress, and severely hamper commerce; but it may be that Russia can carry the load she has taken on her shoulders. The foreign bonds of Russia still maintain a high price, and they maintain it principally because the Dutch and the Germans do not believe in the insolvency of Russia. They do not buy Russian bonds because they love Russia, but because they think Russian finance is in a state far from hopeless; and their opinion, even if it is erroneous, is well worth studying as that of men who are very keen judges of finance.

MR. GLADSTONE'S NEW PAMPHLET.

THE object of Mr. GLADSTONE's latest party pamphlet is sufficiently indicated by the title of "The Friends "and Foes of Russia." As, rightly or wrongly, Russian policy is regarded in England with jealousy, it is rather a transparent than a subtle device of faction to suggest that the popular judgment of the respective relations of the Government and Opposition to Russia is founded on mistake. Two years ago Mr. GLADSTONE and his supporters were earnestly invoking the Russian intervention in Turkey which Lord BEACONSFIELD regarded with unconcealed suspicion. At that time there could be no doubt which were the friends and which were the foes of the famous "Divine "figure from the North." From that time to the present the English Government has been engaged in checking by menace or action the progress of Russian aggression. Antagonism is not generally regarded as a proof of friendship, although ill-judged resistance sometimes promotes the interests which it is intended to injure. Lord BEACONSFIELD may or may not have been well informed when he expressed a belief that, if the Russian invasion of Turkey had been resolutely opposed, there would have been no war. Mr. GLADSTONE and his friends rendered the trial of the experiment impossible, and, although there is some reason to believe that the Emperor of RUSSIA resented the pressure which was placed on his policy by the English agitation, the Opposition, and not the Government, wished for the success of his enterprise. Friendship as well as enmity is generally reciprocal, and Mr. GLADSTONE himself will not carry paradox so far as to assert that Lord BEACONSFIELD's alleged services to Russia are rewarded by gratitude or good-will. The scolding language which he applies to the Russian resumption of Bessarabia will hardly provoke the indignation of Russia. It is too evident that he denounces the transaction only because it was tolerated by the English Government, which had neither opportunity nor motive for preventing it.

While Mr. GLADSTONE still attributes the Russian attack on Turkey to the most laudable and disinterested sympathy, he nevertheless, for the purpose of his latest argument, dilates on the territorial acquisitions which were the reward, if not the object, of a successful war. He insinuates that the conquest of Kars and Batoum, and the annexation of Bessarabia, were benefits conferred in some mysterious manner on Russia by the policy of the English Government. The conquering belligerent not unfrequently obtains material advantages; but those who remonstrated against the original enterprise are not usually held responsible for its results. When the French, during the administration of CANNING, who has lately become the object of Mr. GLADSTONE's admiration, invaded Spain in 1823, the English Government, as in 1877, used all its influence to prevent a wrongful war, although then as now it was not disposed to resist the aggression by force. If there had been a Mr. GLADSTONE in the Opposition of that day, he would have complained that the Ministers were the friends of France because they had allowed the Duke of ANGOULÊME to obtain an easy victory. Sophisms and paradoxes contribute nothing to the solution of a political controversy. If Mr. GLADSTONE could convert a figure of speech into a serious argument by proving that the present Ministers are the friends of Russia, it would still be necessary to inquire whether their policy was just and expedient. It is assuredly not condemned by the fact that, having maintained neutrality in a war between two foreign States, they have been unable to prevent the victor from obtaining solid advantage. Mr. GLADSTONE, except by occasional and feeble vituperation, scarcely attempts to support his converse proposition that the Liberals are the foes of Russia. If he had, until within the last two or three years, taken any interest in foreign policy or in diplomatic history, he would have known that, as Lord ABERDEEN once said when Mr. GLADSTONE sat in his Cabinet the foreign politics of England are the same, whether Conservatives or Liberals are in power. The feelings of the Duke of WELLINGTON and of Lord PALMERSTON to Russia were exactly the same; and neither of them could be regarded as friends of a Power to which they nevertheless professed no enmity. A still more striking illustration of Lord ABERDEEN's proposition is furnished by later experience. Mr. GLADSTONE's Government, as far as is known, pursued exactly the same Eastern policy which it inherited from Lord PALMERSTON and transmitted to Lord BEACONSFIELD. The sudden revulsion which found a cause or pretext in the Bosnian insurrection and the Bulgarian massacres affected only an Opposition. Lord ABERDEEN's statement was confined to successive Governments.

In a summary of the arguments contained in the earlier part of his article Mr. GLADSTONE declares that he has established the following propositions:—"1. The British "Tories are the traditional and natural allies of Russia in "the policy of absolutism which she commonly has fol- "lowed in Continental affairs. 2. They only depart from "her when, as in the case of Turkish oppression, she de- "parts from herself, and is found fighting on the side of "humanity. 3. In thus departing, they have so managed "their resistance that they have played her game, fortified "her position, and humbled their country before her." The object of these questionable propositions is explained in the graceful sentence which follows:—"When our "roystering politicians begin their preparations for the "coming election, these propositions may afford them some "instruction." There is no doubt that the pamphlet is published for an electioneering purpose, in the hope that constituencies may be induced to reject candidates of a party which can be represented as friendly to Russia. A more flagrant appeal to a prejudice of which Mr. GLADSTONE at other times disapproves could hardly have been devised. It is not creditable to a statesman who has belonged to both parties in turn to attempt to exaggerate party differences and to extend them to matters with which they have no connexion. Mr. GLADSTONE ought to know that many thoughtful politicians, who are in no sense partisans, are nevertheless anxious to form a sound judgment on questions of national concern. To such persons a demonstration that certain opinions on foreign politics have been formerly held by Whigs and Tories would be wholly uninteresting and irrelevant, even if it had been given in the most conclusive form. Mr. GLADSTONE shows that his acquaintance with the foreign policy of the present and past generation is utterly imperfect and inaccurate.

Mr. GLADSTONE asserts that "the partition of Europe, "effected at Vienna without reference to the feelings of "the people, was agreeable to the ideas of both (Russia "and the English Tories), and had a kind of sanctity in "their eyes." Yet, as he will perhaps be surprised to learn, the pretensions of Russia were so strongly opposed by England that, immediately before NAPOLEON'S escape from Elba, Lord CASTLEREAGH, Prince TALLEYRAND, and

Prince METTERNICH, concluded a Tripartite Treaty, by which England, France, and Austria bound themselves to resist the claims of Russia and Prussia, even at the cost of war. Russia, he proceeds to say, supported METTERNICH; and yet METTERNICH and ALEXANDER I. were constant and bitter enemies. "Russia eyed askance, "and the Tories abhorred, the foreign policy of "Mr. CANNING." It is strange that Prince and Princess LIEVEN, who then represented Russia in England, should, as the Duke of WELLINGTON frequently with a lofty contempt notices, have incessantly intrigued against him, and that they should also have reconciled GEORGE IV. to Mr. CANNING, and have prepared the way for his elevation to the office of Prime Minister. From the time of his own mission to St. Petersburg the Duke of WELLINGTON entertained to the Emperor NICHOLAS the same distrust which he had long felt for ALEXANDER. He utterly disapproved of the Russian war against Turkey in 1828 and 1829, though he was powerless to prevent it. At a later time the Tories were wholly innocent of the Russian interference in Hungary, which was never opposed by the Liberal Government. It may be true that the late Lord DERBY was hostile to all European parties which he regarded as revolutionary; but in 1858 and 1859, when Mr. GLADSTONE had already for a time allied himself with the Liberal party, he became a supporter of Lord DERBY, and it is nearly certain that he would have become the Conservative leader in the House of Commons, if an intrigue for shelving Mr. DISRAELI as Viceroy of India had not been defeated. It is still more strange that Mr. GLADSTONE should sneer at the supposed sympathy of absolute Governments with Sir ROBERT PEEL when he took office in 1834. It was at that time that Mr. GLADSTONE himself first entered the public service. The article on "The "Friends and Foes of Russia" is vigorous with the energy of passion, and it reproduces the arguments which have been used on the same side during a long controversy. From first to last its merits and demerits are those of a party pamphlet. The spirit in which Mr. GLADSTONE writes is illustrated by his suggestion that the present distress is wholly or partly caused by the policy of Government. Only a few days ago he publicly assured a correspondent that he had no means of estimating the relation between foreign policy and commercial depression.

THE SENATORIAL ELECTIONS.

THE elections which take place to-morrow in France can hardly be said to be interesting as regards their event. That they will return a considerable majority of Liberal Senators is assumed on all sides. But, though the event may be taken as known, the effect which that event will have upon French politics is not known, or at all events not known with anything like the same precision. For example, the real value of a Second Chamber is about to be tested for the first time. The Senate, as it has hitherto been constituted, was the offspring of an accident. It did not represent the constituency which returned it; it spoke the words and thought the thoughts of the late National Assembly. Thus the French Republic began its constitutional life with one of its two Chambers a mere survival. This fact both ensured continual conflicts with the Chamber of Deputies and at the same time prevented these conflicts from being really serious. If a reactionary Senate had really expressed the feelings of the senatorial electors, universal suffrage would have been divided against itself; and it is hard to say how so internecine a strife would have ended. As it was, it was known that the Republicans had only to wait till the date at which the first periodical renewal of the Senate should take place to be secure of a majority in general agreement with the Chamber of Deputies. There could be no inducement to violence when it was well known that all that violence could hope to attain in 1878 would be attained by peaceable means in 1879. In the future the Senate, whatever be its political complexion, will represent the country in the same sense, though not in the same degree, as the Chamber of Deputies. The representation in the one case will be indirect instead of direct, and two-thirds of the Senators may represent a somewhat earlier state of feeling than that expressed by a Chamber which is renewed by general, not by periodical, election. But these are only trifling distinctions. In its general character the Senate will be as much a popular Chamber as the Chamber of Deputies. The hopes of the Conservatives that the municipalities would choose their delegates on local rather than on political grounds have been signally disappointed. When politics find their way into municipal elections even by accident, they usually absorb the whole thoughts of the electors, and it was not to be expected that they should have a less powerful effect when they have been introduced not by accident but by design. It will be interesting to notice whether the antagonism natural to any two bodies which have to consider and pass judgment upon each other's proceedings will make the Liberal Senate different in any marked respect from the Liberal Chamber of Deputies. But for this it might be supposed that for the future the only function of the Senate will be to register the decrees of the other half of the Legislature. The duty of making its measures consistent and intelligible—a service which in this country is occasionally rendered by the House of Lords to the House of Commons—devolves in France upon the Council of State. Whether a Chamber which possesses legal independence will always forego the exercise of it because it does not differ on fundamental questions from the Chamber with which it is nominally equal affords interesting matter for speculation.

A more practical question is the effect of the change in the character of the Senate upon the composition of the Cabinet. It has always been recognized that the creation of a Liberal majority in both Chambers would place M. DUFAURE in a different position from that which he has hitherto held. So long as the Senate was reactionary, there was a possibility that, if Marshal MACMAHON were driven too hard, he might again risk a quarrel with the Chamber of Deputies; and it was consequently important that the Prime Minister should be a politician who possessed, among his other gifts, the faculty of not exciting the PRESIDENT's fears. M. DUFAURE has this faculty in a very high degree. Probably the MARSHAL feels scarcely less safe with him than he felt with M. DE BROGLIE. To secure this end it was obviously worth the while of the Left to postpone the advent of a Ministry more completely in unison with their own views. M. DUFAURE is a genuine Republican; and, so long as he remains at the head of affairs, there is an absolute certainty that the Chief of the State will not be led astray by his reactionary friends; and, when these reactionary friends actually commanded one branch of the Legislature, this was an important consideration. The first question that suggests itself in connexion with to-morrow's elections is whether it will remain an important consideration. Will there be any danger of Marshal MACMAHON trying without the co-operation of either Chamber the experiment which he tried unsuccessfully when he had one Chamber on his side? All the probabilities of the case point to the absence for the time to come of any such danger. Without the Senate at his back, Marshal MACMAHON could not possibly set up any constitutional pretensions; he must come forward simply as a Saviour of Society. Upon this head it seems enough to say that he is not of the stuff of which Saviours of Society are made. There must be some inducement for a man to play such a part, and in this case the only inducement would be the satisfaction of keeping a place warm for HENRY V. or NAPOLEON IV. The MARSHAL is not so devoted to either pretender as to be ready to run the immense risks of a *coup d'état* for no more interesting purpose than to put a King or an Emperor in the seat which he himself now occupies as President. Nor does there seem to be much ground for fearing the consequences of his resignation. The Liberal party have had time enough to prepare for that contingency, and M. GAMBETTA long ago said that the candidate had already been selected. Besides this, the MARSHAL has no obvious inducement to resign. If he cares about retaining the good opinion of the Conservatives, he should have resigned on the 13th of December, 1877. The months that have passed since that day have probably made the ill opinion of his former friends less terrible to him, while they have taught him that office has some charms left even when it is shorn of its personal attributes.

As the particular reason which has always been assigned for M. DUFAURE's remaining in office seems to be no longer operative, the question that will have to be decided after the senatorial elections is whether, in the interests of the country generally, the Left ought to be content with the Ministry as at present constituted, or to insist on a more

adequate representation in the Cabinet of their own views. M. DUFAURE stands to the Liberal party of to-day in France much as Lord RUSSELL stood to the Liberal party in England after the election of 1868. It may be argued, therefore, with great show of reason, that, as Mr. GLADSTONE was the proper leader for English Liberals at the last-named date, so M. GAMBETTA is the proper leader for the French Liberals at the present moment. It would have been plainly unsatisfactory to all parties if Mr. GLADSTONE had refused to take office, and had contented himself with acting as dictator to a Ministry led by Lord RUSSELL. A politician who is the acknowledged head of the most powerful party in the country and in the Legislature ought not, it may be said, to stand aside and only exert his paramount influence behind the scenes. As a general rule this is undoubtedly true. The proper place for a man of M. GAMBETTA's pretensions is at the head of the Ministry—unless, indeed, it be rather at the head of the State. This is the main reason which leads us to doubt whether it would not be better for France that M. DUFAURE should remain in office. The Constitution of the Republic cannot be regarded as finally settled in all particulars. Since 1871 both theories of the President's functions have been tested by experiment, and there is nothing to show that the one which has prevailed since Marshal MACMAHON has been in office is preferable to that which prevailed when M. THIERS was in office. It is exceedingly doubtful whether a succession of really qualified men will be found to accept the office if it remains entirely devoid of real power. What manner of men are they to be? If they are members of one or other of the dethroned families, they will, for a long time to come at all events, be considered as placed there to bring about a restoration. If they are successful generals, they will be suspected of intriguing with the army. If they are eminent statesmen, they will inevitably grow weary of a dignity which leaves them for all the real purposes of politics the puppet of their own Ministers. If none of these classes of men seem to serve the purpose, in what direction is the search to be further prosecuted? These considerations suggest themselves so inevitably that they cannot possibly have escaped the notice of the Liberal leaders in France, and the result may be to make the maintenance of the present Ministry desirable for some time longer.

SIR WILLIAM HAYTER.

THE regret which has been felt on the death of Sir WILLIAM HAYTER at a great age, after a retirement of twenty years, is at the same time a tribute to his personal merit and a proof of the importance of the remarkable employment in which he gained his reputation. The political Secretary of the Treasury, if he performs his duty efficiently, is doubly entitled to the gratitude of his party, because he is expected gratuitously to discharge in Opposition nearly the same duties as in office. The adjutant of the party is sometimes only second in influence to the leader, and even his chief depends in some degree on his practical advice. It is not the business of the Whip to recommend any policy as in itself beneficial, but to feel the pulse of the House of Commons, and to communicate to his superiors the result of his observations. He is also bound by his activity and tact to maintain discipline in the ranks, even when he may perhaps personally sympathize with mutinous tendencies. When a Prime Minister or party leader of Opposition has himself a natural aptitude for party management, the Whip becomes his principal agent. At other times the humbler functionary supplies the deficiencies of his official chief. Sir W. HAYTER served Lord JOHN RUSSELL and Lord PALMERSTON; but he was never supposed to be responsible for their more flagrant mistakes. He would certainly, if he had been consulted, not have advised Lord JOHN RUSSELL to publish the Durham Letter, or a year afterwards, at the instigation of the Court, to dismiss Lord PALMERSTON from office. At the next general election Sir W. HAYTER is said to have given an impartial support to the respective adherents of the rival Liberal leaders. He perhaps foresaw that the party would reunite, and it was not his business to determine whether Lord JOHN RUSSELL or Lord PALMERSTON had the better claim to its allegiance. Though he did his duty loyally to the Coalition Government of Lord ABERDEEN, he must have found his place more congenial to his tastes and habits when the former followers of Sir ROBERT PEEL retired from power. It is not known whether he afterwards warned Lord PALMERSTON that his offhand demeanour and his exclusive regard for aristocratic connexion in the choice of his colleagues were rapidly alienating the favour of a House of Commons returned almost expressly to support him. When, in his second Administration, Lord PALMERSTON showed that he had taken warning by the lesson of 1858, Sir W. HAYTER had retired from office. In his eight years' service he saw two Liberal majorities frittered away; and he may perhaps have envied his opponents the skill of their leader. It was not his fault that one of his chiefs was unduly self-confident, and that the other was, for the first and last time in his life, temporarily intoxicated by success.

In most cases the leader of the Government or Opposition is well advised in preferring the judgment of his Secretary or ex-Secretary of the Treasury to his own on matters within his department. A sagacious and practised observer who spends his life in watching the temper of the House of Commons can form a sounder judgment of its probable action than a statesman who ought to think more of the public interest than of his own fortunes. The same functionary is in constant communication with the local managers of the constituencies; and he has therefore special opportunities of judging whether any policy will be generally popular. If it is true that the last Parliament was suddenly dissolved by the advice of a former Secretary of the Treasury, the supporter of the measure must share with its author the blame of a flagrant miscalculation. A failure to understand the disposition of the House of Commons is less excusable; but in such cases it is sometimes impossible to distribute the responsibility between the leader and the Whip. In the Session of 1877 Sir STAFFORD NORTHCOTE accepted a proposal of a new system of county government after a Treasury Circular had been issued to announce a division on the Bill, and even when a member of the Government had delivered an able speech against it. Only the other day the motion for the Rhodope grant was withdrawn after notice, because it was found that it could not be carried. In both instances a check had been wantonly incurred, either because the advice of the Secretary of the Treasury had not been asked in time, or because he had failed to discern the feeling of the House. In neither case was the subject-matter of primary importance; but a miscarriage which might have been avoided by the exercise of due foresight weakens the authority of a Government. A leader of Opposition can incur risks with comparative impunity; yet Lord HARTINGTON's imprudent suggestion of the disestablishment of the Scotch Church is generally attributed to the influence of his official adviser. It remains to be seen whether Mr. ADAM miscalculated the comparative strength of the Established Church and the nonconforming Presbyterian sects. A statesman might perhaps prudently resolve to be only negatively guided by the real or supposed opinion of Parliament or of the country. It is undesirable to introduce measures not in themselves expedient only because they may perhaps be popular.

The duties of the Secretary of the Treasury have become much less irksome since the introduction of competitive examinations. It was extremely troublesome to apportion the number of petty posts in the public service to the claims of every supporter of the Government, or perhaps to the exigencies of his constituents. At present there is little opportunity of choosing between enmity and ingratitude, except in the higher kinds of patronage which affect members rather than electors. The Whip of a party has great facilities for introducing candidates to constituencies, though local pretensions become at every successive election more effective. The late Mr. ELLICE, who was Secretary of the Treasury to Lord GREY, had probably some share in the return of half the majority which carried the Reform Bill. Sir W. HAYTER must, twenty years later, have performed similar services to many Parliamentary aspirants. Another duty of his office was to listen to the requests of members of the party who thought that they had earned baronetcies or other titular distinctions. A Prime Minister probably reserves to himself the distribution of peerages. As all these things have to be done, it is as well that they should be managed by upright and prudent men; but the conditions of Parliamentary government are sometimes not a little surprising. It seems inevitable

that the members of a sovereign assembly should divide themselves into parties which both respectively support different political opinions, and compete with one another for the control of the Executive Government. Having once come into existence, parties, like many other organizations, acquire a substantial character, and struggle for political supremacy, not as an instrument, but as an object. It then becomes necessary that they should be recruited, regulated, and guided, and Secretaries of Treasury are invented for the purpose. On one hand they must persuade a majority to pass even an Ecclesiastical Titles Bill, and on the other they ought to prevail on their chiefs to try as few experiments of the kind as possible.

Party Whips are generally popular and successful, because they are almost always chosen on account of their special qualifications. A Minister who appoints an incapable favourite to such a place must be disinterested as well as rash. The requisite qualities are such as can be appreciated by the world in general; and when a vacancy occurs one or more candidates for the place are designated by general consent. Pedants, projectors, and members of strong and narrow convictions are necessarily excluded from competition. The Whip must be a man of the world, and he must know how to deal with men; while it is wholly unnecessary that he should care for political theories. The doctrine that the Liberal or Conservative party, as the case may be, ought to be in power forms the essential article of his creed. In advising his chief he prefers the policy which will command the largest support, and it is his business to reconcile the party to the decisions of the leaders. At the same time he must not, at least in outward bearing, be a bitter or intolerant partisan. He has, to a certain extent, to keep the other party, as well as his own, in good humour, and to cause necessary business to be transacted without unnecessary friction. In dealing with opponents his functions in some degree resemble those of an advocate or diplomatist. Contests of all kinds are most quietly and most conveniently conducted by dispassionate agents who represent the interests, but not the passions, of their principals. The House of Commons could scarcely get through its work if the Whips on either side could not implicitly rely on the good faith of their hostile colleagues. Members of Parliament of the generation which is now passing away regarded Sir W. Hayter as one of the ablest incumbents of the office which he held for several years. He was heartily loyal to his party; but he was not apparently enthusiastic for any policy which it might adopt, rightly preferring success to the affirmation of abstract principles. His pleasant manner rendered him popular with opponents as with friends, and his chiefs had, within the range of his department, no more sagacious advisor.

HOME RULE AND IRISH EDUCATION.

It seems not unlikely that the character and aims of the so-called Home Rule movement have been somewhat misunderstood on this side of St. George's Channel. The cry of legislative independence has been so loudly raised that Englishmen have been led to regard legislative independence as the one thing which a large number of Irishmen desire. It would be a pleasant surprise to learn that Home Rule had only been asked for as the surest and shortest means of obtaining a variety of other ends; for, if this could be assumed as possible, the difficulty of dealing with Irish demands would be very much lessened. A claim which is quite inadmissible in degree may be so far admissible in kind as at least to deserve attention; but the vice of Home Rule is that, in any form or degree that can fairly be called Home Rule, it is and must remain inadmissible. As we have said more than once lately, an independent Ireland would on all grounds be preferable to an Ireland united to England by a merely dynastic or federal tie. Mr. Dease's letter to Mr. Adam gives some hope that Irishmen are beginning to see this for themselves. It is a gain to have the relations of Irish members to political parties discussed with reference not to the substitution of a local for an Imperial Legislature, but to the action of the Imperial Legislature on Irish questions. No reasonable man would question the right of Irish members to withhold their support from any political party which did not admit Ireland to her fair share of the improvements which that party may think proper to include in its programme. Whether Mr. Dease has made good his particular charge against the Liberal leaders is a point into which it is needless to enter here. The plain fact is that English members have been made so angry by the obstructive tactics of certain Home Rulers that it is quite impossible to bring them up to vote for any Irish proposal so long as those tactics are persevered in. If they are really abandoned, the competitive willingness of both parties to stand well with Ireland on the eve of a general election may probably be relied on to secure for Irish questions at least as much attention as their relative importance demands. The Liberal party in England is not likely to repeat the blunder it made in 1873, though it is less certain that, if the Irish Roman Catholics had another such offer made to them as that contained in the Irish University Bill of the late Government, they would deal with it any more wisely. But Mr. Butt himself has told us that, so long as Mr. Parnell and his fit though few supporters make the despatch of business impossible for days together, no Irish question will have a chance of being considered on its merits. If the alliance between English and Irish Liberals is to be renewed, or a fresh alliance cemented with the Conservatives, the first step towards such a consummation will be the excision of Home Rule from the list of Irish demands. When that has been effected, English and Irish members on both sides of the House will once more be able to approach Irish questions with some hope of agreement.

There is not much apparent reason, however, for the Liberals to anticipate that the result of the competition will be to their advantage. The Irish vote is easily detached from the Liberal side by the hope of favours to come; and there are very few of these favours which they may not look for from the Conservatives with quite as good reason as from the Liberals. The Church question is out of the way. The Land question is still open; but as the Act which is complained of was the work of a Liberal Cabinet, Conservatives are in the convenient position of benefiting by its unpopularity without being bound, unless they think fit, to propose remedial legislation. On the third of the great issues which constituted the Irish element in Mr. Gladstone's policy the two parties stand, for different reasons, in very similar positions. In dealing with University Education in Ireland the Conservatives have to reckon with Irish Protestant feeling; while the Liberals have to reckon with English Dissenting feeling. Probably the leaders on both sides entertain an impartial contempt for the prejudices which stand in the way of any lasting and satisfactory settlement of the question. But as yet they have shown no power of overriding these prejudices. The Conservatives are afraid of the outcry that would rise up against a Government which proposed to endow Antichrist. The Liberals are afraid of the outcry that would rise up against a Government which proposed to endow religion. What with the anti-Papal enthusiasm of some Conservatives, and the anti-denominational enthusiasm of some Liberals, neither party is likely to have a very easy time of it when the attempt to improve the higher education of Ireland is actually made.

Certain students and ex-students of the Catholic University in Dublin have lately contributed their share to the confusion which exists on this question. They have heard—it does not appear from whom—that the Government intend next Session to bring in a Bill which shall settle the Irish University question and give Irish Catholics equality in the matter of University education, by setting up in Ireland an examining Board which would examine students and confer upon them prizes, exhibitions, and degrees, no matter where they may have studied. That something of this sort is in contemplation is probable enough. It would be a natural corollary from the legislation with regard to secondary education last year. In that case the difficulty about endowments was got over by the expedient of separating examination from study, and making the prizes depend entirely upon the number of marks the candidate might have gained. This measure was a remarkable success, and we might naturally expect that, if the present Government take up the subject at all, they will follow the lines of their previous success. If, however, the students' address is to be taken as indicative of Irish Catholic feeling, the Government may spare themselves the trouble of framing an Irish University Bill on this plan. Such a Bill, say the students, will not confer educational equality on Irish Catholics, and consequently

will not settle the Irish University question. It is bad enough that Trinity College should hold large endowments while the Catholic University remains absolutely unendowed. But it is worse that, while the revenues of Trinity College are left untouched, the very existence of the Catholic University should be rendered impossible. That this would be the result of setting up a mere examining body in Ireland follows, the students say, from the fact that, if the prizes of the State University were attainable by all, no matter where they had studied, the attractions of superior cheapness would tempt Catholic parents to "keep their sons in provincial "schools, or to commit them to the care of 'grinders.'" Thus the only institution which offers University teaching combined with University residence in a shape in which Roman Catholics can accept it would come to an end from want of support. "If Irish Catholics hope "ever to qualify themselves to take their proper place in "this country, the first essential is the existence of a great "Catholic educational centre," and the provision of an adequate endowment. We wish we could see the slightest likelihood of this view finding acceptance with either Liberals or Conservatives. It is to be feared, however, that, no matter which of the two parties brought in such a measure, the whole strength of the other party would be devoted to defeating the scheme, in the hope that it would involve the Government in its fall. A proposal for the direct and specific endowment of Popery would supply a temptation to an Opposition which neither of them would be able to resist. Mr. ARNOLD took us to task some time ago for admitting this; but to admit it is not to justify it, and we can scarcely believe that any one who is acquainted with the ordinary behaviour of political parties when in opposition would hazard a contrary prediction. The question is, therefore, whether there may not be some modification of the plan attributed to the Government which would make the continued existence of the Catholic University possible as one element out of many in a larger scheme of University education. The address of the students draws a distinction between a measure which would offend against educational equality by withholding endowments from the Catholic educational centre, and one which would offend against it by destroying that educational centre. It would at all events be an interesting experiment to introduce a Bill which should have only one of these disadvantages instead of both. At the same time it must be remembered that Governments are apt to be shy of political experiments, curious as these might be to the impartial bystander, when their popularity or their existence is at stake.

REMEDIES FOR THE DISTRESS.

IT seems likely that the severe weather which broke up at the end of last week gave an unduly threatening air to the distress which is so generally felt. The cold put an end to outdoor labour of all kinds, and, while it lasted, skilled and unskilled workmen—workmen who know only one trade, and workmen who turn their hands to any trade that offers itself—were equally without employment. Part, however, of the distress thus caused was of a strictly passing character; while there was nothing to be done it lasted, but as soon as work became once more possible it disappeared. It was a distress that had nothing in the least peculiar or distinctive about it. That it has become in any degree unfamiliar to us is due to the fact that the last two or three winters have been exceptionally mild, and consequently have allowed a number of occupations which have lately been at a stand to go on without intermission. People soon become accustomed to good or bad fortune, and if we have a succession of hard winters the presence of the distress they cause will come to seem as natural as its absence has seemed of late years. It is not until we have learnt to distinguish between the two kinds of distress which were contemporaneous during the frost, that we learn how severe the kind which is not caused by the weather has lately become. No change in the sky or the temperature will affect the future of the iron trade or of the cotton trade. The absence of work in these great industries depends upon more remote and more lasting causes. It will be well therefore to be on our guard against the tendency which already seems observable to under-estimate the trouble ahead. The apparently brighter accounts that have appeared this week are either the corrections of previous exaggerations which still leave the truth sufficiently serious, or they relate to districts in which no serious or exceptional distress exists.

The letters which have appeared in the *Times*, or were read at the meeting of the Charity Organization Council on Monday, point out a danger which has to be carefully guarded against. There is always enough distress in the East of London to simulate exceptional distress. The population is very poor and very shiftless, living mostly from hand to mouth and by work which, though it may be regular on the average, is intermittent and uncertain in each particular case. If benevolent persons who have no knowledge of the poor go down into Whitechapel or Bethnal Green, they are sure to see a great deal which will excite their commiseration. If their heads are full of what they have been reading about the exceptional distress in various parts of the country, they will easily persuade themselves that in East London also it is exceptional. From that it is an easy step to the formation of Relief Committees, central and local. When once these are started abundance of money comes in, and it becomes almost a point of honour with the Committees to find claimants for it. Nor, indeed, have they any difficulty in doing so. East London in such times becomes a very carcase round which the vultures of professional beggary and that thriftlessness which has just wit enough to know where charity will maintain it in idleness are at once gathered together. The fact that in the last great period of distress and relief in East London the rents of the poorest class of houses positively went up is a striking testimony to the nature of the process that was going on there. The alms which were then dispensed were regarded as so many privileges appertaining to residence in that favoured district, for participation in which it was only reasonable that a fair price should be paid. If further evidence were wanting, the letters of Mr. WALROND, Mr. BARNETT, and Mr. HANSARD would furnish it. They all testify to the horror with which their writers view the creation of a special relief organization. There are quite enough agencies at work, they say, already. If the public want to relieve the distress which undoubtedly does exist in East London let them give their money through one of these. Exceptional needs call for exceptional machinery to meet them; but in East London the needs are not exceptional. There is no large population out of work and requiring to be supported by means of work extemporized for them to do. There are merely the isolated though numerous cases of individual distress which can be best dealt with by the agencies which are already well acquainted with them. To hand them over to newly enlisted volunteers would be simply to tempt imposition.

In districts where really exceptional distress exists a different course has necessarily to be pursued. The ordinary relief agencies are competent to deal with the kinds of poverty to which those who administer relief are accustomed, and so long as the difference between this winter and other winters is only that there is more poverty than usual of the usual type, there is no need to supplement them by any exceptional organization. But when the poverty is not of the usual type, when, on the contrary, it has little or nothing in common with the usual type, when it lays hold of a class which is commonly exempt from it and which has only been involved in it because of the unusual length and severity of the present depression of trade, the ordinary agencies are necessarily powerless. For one thing, there is need, not necessarily of larger funds, but certainly of larger powers, than any charitable society can command. The distress, so far as it is really formidable, affects a population which in other years is, even in winter, in pretty constant work. Now it is, and in many cases has for a long time been, out of work. This difference suggests, and even necessitates, a corresponding difference of treatment. When a man is out of work for a few weeks at a time he ought to be able to maintain himself out of his savings, and if he has saved nothing he may fairly be left to the Poor-law. In cases where there has been an unusual amount of sickness, or unusual claims of any kind to be met out of his wages, he may be a proper object for private charity. But it is not expedient to spare him the disgrace or annoyance, such as it is, of applying for one or the other. In a period of distress like the present the savings have all gone; they were used probably in the first instance to equalise the weekly income when wages began to fall, and when it was hoped that the dull time would be of short duration. A

large proportion therefore of the sufferers at present are men whom it is not desirable to send either to the Poor-law or to private charity—in the sense in which that term is commonly understood. They are starving, not by their own fault, and consequently there is no need that starvation should bring any further punishment with it. Indeed there is every reason why it should not. Nothing but demoralization can come of reducing large bodies of people to the condition of conscious paupers or conscious beggars. The superiority of one scheme over another will be largely determined by the success with which it avoids this danger.

What is wanted, therefore, is a plan of public works which shall enable the local authorities in the distressed districts to turn all this unemployed labour to useful account. So long as there are roads to be made, or land to be laid out, or any kind of local improvements to be effected, nothing can be gained by setting applicants for relief to break stones, or to do any of the tasks usually associated with pauper labour. Inasmuch as the money paid for this labour is provided by private subscription, the work should not be of a kind which, but for the occurrence of the distress, would have been undertaken by the local authorities at the cost of the ratepayers. But in every centre of industry there is abundance of work to be done, which, though not useful in the sense in which work paid for by a compulsory rate ought to be useful, would yet be highly useful in the sense of benefiting the inhabitants. Inasmuch as this work would never have been taken in hand in ordinary times, ordinary labourers would never have been employed on it. No objection could therefore be raised on the score of interference with the labour market. It is not meant of course that the full wages paid at other times for such labour should be paid now. The fact that the works are intended to stave off destitution should be kept in view, and only such pay given as is required to keep the labourers and their families in fair health. Nor, of course, would work be given to any man who had other means of support. If, for example, there were men in the district who had chosen to add to the distress by taking this opportunity for striking, they should be rigidly excluded from work so long as they were in receipt of any strike pay. Under the careful supervision which local knowledge would supply, it would not be difficult to limit the benefit of the works to men who were at once earning nothing and willing to earn anything that they could.

THE INDIAN FRONTIER.

NOW that the prospect opens before us of a termination of the military operations in Afghanistan, the settlement which is to follow will become the question of the day. A wise adjustment of the conditions of peace with Afghanistan is far more important than even a vigorous prosecution of the war; for it is not too much to say that the course of our whole future policy in Central Asia will turn on the decision to be taken so soon as actual hostilities are ended. Upon this must depend whether it will be possible to revert to our former condition of tranquillity, or whether we are to enter on a new era of political unrest and excitement and financial difficulty; and towards a right solution of the problem two contributions have lately been furnished of the highest value—the address delivered by General E. B. Hamley at the United Service Institution, and the article by Sir Henry Norman published in the current number of the *Fortnightly Review*. General Hamley discusses the question solely from a strategic point of view, and no higher authority on such a point can be found; General Norman regards it with the experience gained by a lifetime spent in Indian service—first on the frontier, and afterwards in a variety of high and responsible offices; and it is very noteworthy that these two distinguished officers arrive at conclusions in many important respects identical, but which are opposed to what is apparently the current of opinion on the subject at the present moment.

General Hamley is strongly against the permanent occupation of any position in advance of the Khyber Pass. It is not by that line, he thinks, that an invasion of India is to be feared, while an outpost at Jellalabad or any other point beyond the Khyber would be in an essentially false military position, a source of danger instead of strength, useless for offensive purposes, and always liable to have its communications cut off. On the other hand, while an enemy advancing by way of the Khyber would emerge into the Peshawur valley under most unfavourable circumstances for his attack, the head of his column being exposed to be crushed by the defender awaiting it while the rest of his army was still struggling through the rugged defiles in rear, his whole force spread over a distance of several days' march, an advance by way of the Bolan would offer much greater chance of success. An army coming by that route would, on issuing from the mountains, have room to deploy upon the plains of the Indus, and would have at this point a certain degree of choice of routes, along any of which it could advance to the attack on a compact front. And, although General Hamley considers that, with our communications properly completed along the Indus line, between the sea on the one hand and the Punjab on the other, we ought to be able to give a very good account of any adversary on the ground between that river and the mountains to the west of it, still he would much prefer to meet him on the further side of those mountains. In this view General Hamley considers the occupation of Quetta the most valuable strategic move that has been made. He would extend this so far as to occupy Candahar also, pushing on an advanced post to Girishk on the Helmund. An army in this position, with its rear supported by a fortress at Quetta, while securely covering its communications with India, would have military command of the whole of Afghanistan. It would intercept the communication between Herat and Cabul, and effectually prevent any movement from the latter place on India by way of the Khyber. All along the line of the Punjab, therefore, General Hamley would keep to our present frontier, merely strengthening our position by defensive works at the entrances of the different passes. It is only on the lower Indus, westward of Sind, that he would throw a flank forward.

Sir Henry Norman, on the other hand, while entirely agreeing with General Hamley as regards the policy to be adopted on the Peshawur and Kohat frontier, would have us withdraw, on the conclusion of the war, even from Quetta, which we have held since 1876, and keep strictly within the frontier which we have held ever since the annexation of the Punjab in 1849. In reality, however, there does not appear to be so much disagreement between the two writers, even as to the occupation of Quetta. General Hamley is throughout discussing the question on the supposition that we have to encounter a powerful enemy, wielding great resources and occupying Afghanistan in force. Sir Henry Norman is dealing with Afghanistan as it is. Every one is agreed that Russia must be kept out of that country; but is it necessary for this end that we should be always there ourselves in occupation? Disguise it how we may, the permanent retention of Jellalabad means the occupation, before long, first of Cabul, and eventually of the whole country. There is nothing impracticable about this, but it would be enormously expensive; the troops there would be so much added to the permanent garrison of India, and, far from being a source of strength, would be a source of continual anxiety. Not a man could be brought from Afghanistan to assist in dealing with any difficulty arising in India itself; on the contrary, an outbreak of disturbances elsewhere would be the signal for risings of the turbulent inhabitants of those regions, and among the troubles incidental to such a time would be included the additional strain involved by the need of reinforcing these distant outposts. For no one, it may be presumed, seriously contemplates maintaining a force in Afghanistan of thirty or forty thousand men, a self-contained body which would be able to hold its own without aid from India. The most that the advocates of a "forward" policy would probably admit that they contemplate at present is the occupation of Jellalabad and Candahar and Quetta by strong brigades, with such indefinite support in rear as might suffice to accomplish the hitherto insoluble problem of keeping communications open with India through the passes behind them, inhabited as they are by the lawless and treacherous tribes of whom we have lately been hearing so much. But clearly, if it is to be a question of meeting Russia in Afghanistan, these isolated garrisons will not suffice; it would be a sufficient task to hold a magnified Switzerland with three or four brigades when the people of the country alone have to be dealt with; but supposing we have to encounter a civilized Power wielding a large army, we must evidently send forward a force on a scale of strength compared with which the original garrison which it is now proposed to place there would be quite insignificant. Why, then, place that small garrison there in the first instance, with all the risks and inconveniences attending that measure? Many will answer, To give us the means of entering the country in force whenever the occasion arises for doing so. This, however, is just the question at issue; and the importance of coming to a right judgment upon it can hardly be over-rated. Which course will be the least troublesome and expensive, and in all respects the least objectionable—to keep within our frontier, holding ourselves, however, in readiness to advance in strength whenever the occasion may arise, but meanwhile abstaining from any occupation of Afghanistan; or to push forward garrisons which shall be neither outposts nor armies, the presence of which will make us detested by the people of the country, and which will have to be largely reinforced whenever either India or Afghanistan is seriously threatened from the west? The former is the policy advocated by Sir Henry Norman, and, as we understand it, it is altogether different from that which Lord Lawrence proposed, and which was so justly reprobated in all quarters. Lord Lawrence would be for awaiting Russia quietly in the plains of the Indus, permitting her to mature all her arrangements undisturbed, and trusting to be able to defeat her armies as they issued from the mountains—a policy so fatuous that it is due to Lord Lawrence to suppose that he was led to put it forward only by the heat of controversy. Sir Henry Norman would be for meeting Russia or any other threatening enemy in advance, going to meet her before she comes to us; but he contends that the time has not yet come for making this forward movement. It is not as if

the objective point at issue were a bridge-head, or even a fortified position which the two sides were each racing to get to first. Russia is still a long way off, and her influence in Afghanistan, we may hope, is now to be effaced for some time to come. If she tries to re-establish it, we are bound to destroy it again; and long before the time came when Russia could find herself holding any part of Afghanistan in strength, those who share the opinions advocated by Sir Henry Norman would be for taking up the strategical position at Candahar, dominating the whole country, so ably sketched out by General Hamley. What they maintain is that the time for doing this has not yet come, and that when it does come the precedent of the present war, equally with that of the last, shows that it is in our power to enter and occupy the country whenever we please; and that therefore it is far wiser to husband our resources in the meanwhile by saving the expense which a partial occupation of the country would involve, accompanied as it would be by the certain alienation of its people.

What, no doubt, must be insisted on at any cost is that English influence should be paramount throughout Afghanistan, and that we should have the means of getting trustworthy information at all times about what is passing on the frontier. But it does not at all follow that the occupation of Jellalabad or Candahar would make it any safer for a British officer to live at Herat. On the contrary, we may expect that the extreme unpopularity of such an occupation would dangerously manifest itself wherever our countrymen were isolated or unprotected. On the other hand, there is now an opportunity for establishing friendly relations with the people and rulers of the country, such as we have never had before, and such as may never occur again. Insist on perfect freedom of access to the country for British subjects of all classes, and that Russian influence in every form, direct or indirect, shall be excluded; and be prepared to advance at any time into the country, if necessary, to enforce these terms; but do not keep a soldier beyond the frontier after peace is proclaimed; do not annex any territory, and at the same time respect the independence of its internal government. In this way it may be possible, by proving both our disinterestedness and our determination to avenge affronts, to establish friendly relations with the country, based on a feeling of mutual respect and self-interest. It would be far less troublesome, and less costly, in the opinion of those who take this view, to make an expedition into Afghanistan occasionally to enforce our demands, always returning again as soon as we had effected this object, than to embark in all the difficulties and dangers of permanent occupation; the least of which are that we may find ourselves drawn into a much larger and more expensive scheme than was at first contemplated, and also that a time for retrenchment may come, with the inevitable policy of reaction; and that then the outlying garrisons may be cut down to a dangerously low point, to be followed, not indeed by disasters like that of the last occupation, but which might yet be serious and discreditable.

Looked at from every point of view, the course now to be adopted, one way or the other, is of deep import to the future both of India and of this country. We may at least hope that, if there is to be annexation, the sagacious reasoning of General Hamley will avail to prevent such a military blunder being made as the occupation of Jellalabad; while the forcible remonstrance of Sir Henry Norman may at least make us pause to ask whether the strategic combinations drawn out by the former, however intrinsically admirable, ought not to be for a time deferred, as being applicable to a condition of things which has not yet come to pass.

HOUSE-HUNTING.

AMONG the various conditions of life in which one feels more or less like a fish out of water is that of a man wandering about London armed with "orders to view." His powers are, for the time being, both extraordinary and embarrassing. He rings at the door-bells of people whom he does not know, provided with search warrants enabling him to inspect their homes from top to bottom. He has only to call upon a house-agent in any quarter of the metropolis, and express a wish to find a house with a certain number of rooms at a reasonable rent, and he will be immediately presented with slips of paper, not unlike cheques, empowering him to invade the privacy of several of the neighbouring houses. One might imagine a being endowed with such plenary powers to be an object of dread; but, in reality, he himself usually feels rather embarrassed and uncomfortable. He is to be observed at street corners, shyly looking over the agent's lists, and sorting his orders to view, with an unhappy and perplexed countenance. Having selected the scene of his attack, he nervously rings the bell and knocks timorously at the door. He then is placed in this dilemma—that if the family is at home he feels he is an intruder, and if the family is away he has to wait about ten minutes at the door until the "party in charge" chooses to present herself, after a tedious unlocking, unbolting, and unchaining of doors; eventually enduring a long delay in all the reception rooms while the shutters are being opened. He is lucky if, when the owner of the house and his family are absent, a seedy-looking man in black attire does not open the door and say that the housekeeper has "stepped out" for half an hour, concluding by observing that he is her uncle or cousin. On the other hand, when the master is at home, it is not unusual for the servant who answers the door-bell to assume an air of injured innocence at the very imputation that the house is to be let at all, and to treat the would-be "viewer" as if he were a bailiff. When we ring the bell of a house with closed shutters and "To Be Let Furnished" posted in the windows, every passer-by seems to regard us with looks of pity. A baker's boy, with a basket on his back, wears an expression which we interpret to mean, "That is the house where they had the scarlet fever." A professional-looking man, probably a doctor, seems as though he would say, "I could tell you something about the drains at that house"; and when the confidential servant of the family opens the door, she is clothed in deep mourning.

The physical act of house inspection closely resembles the punishment of the treadmill. The climb from the cellars to the garrets of a large London house is beyond a jest; and the thorough examination of half-a-dozen houses between breakfast and luncheon is a matter of considerable bodily fatigue. After all his trouble, too, the amateur is often mistaken in fancying that he has made a thorough examination. Perhaps he returns to his hotel imagining that he has investigated everything, and carrying in his pocket copious notes; but a few questions from his wife soon enlighten him as to the true value of his labours. He is asked whether there are fireplaces in all the rooms in the highest story of one house, and whether hot water is carried up to the second-floor of another; he is also cross-questioned about various matters relating to the sculleries and offices. The probability is that he fails completely in his examination, and may even be called stupid, after all his trouble. This is a poor reward for unselfishly exposing himself to the suspicion of being a possible burglar in disguise at every house which he has inspected. The hours which he spends at his hotel are devoted to studying the map of London, on which he measures the distances from the houses which he fancies to certain objects of personal interest, such as his Club, the Park, the Opera, &c. Anxious examinations are made as to the whereabouts of the Underground Railway, as there are generally some most eligible mansions to be let immediately over the greater part of the South Kensington portion of that line. The house-hunter often imagines that he has found exactly the house that he wished for, when the rumbling of the trains, or the coloured line on the map, dash his hopes to the ground. The two great bugbears, however, of house-hunters are (or should be) defective sanitary arrangements and smoky chimneys. As regards the former, it is always desirable to send an independent and trustworthy agent, who has no interest in the letting of the house, to make a thorough examination, accompanied by a competent workman, who will climb on leads and handle waste pipes and traps. This only costs a small fee, and saves much after-trouble. But what shall we say of smoky chimneys? We remember taking a charming house for an interesting occasion. It was prettily furnished and the rooms were airy. The best bed and dressing room seemed all that could be desired. When, however, there was an addition to the family the wind changed, and the chimneys of the two chambers in question proceeded to smoke in the most vicious and determined manner; and we soon learned that smoky chimneys and a scolding wife are a trifle compared with smoking chimneys and Mrs. Gamp. We will not dwell on such horrors; but we may observe that servants appear to consider their masters personally responsible when a chimney smokes. They probably argue in some such manner as this—"Why did master take a house with smoky chimneys?" or, if the house is his own, "Why does he not have contrivances adjusted to them to prevent their smoking?" When the wretched man is summoned into a room in which the smoke is descending in volumes, no excuse that he can urge will be tolerated, and his domestics look at him as if they thought it was all his fault, and that the least he could do would be to stuff himself up the chimney, like a straw bag, in order to abate the nuisance.

Among the minor annoyances on taking possession of a house is the disappearance of everything which tended to make it look pretty and habitable when we first went over it. The nice pieces of old china are gone, and so are the Persian carpets and the handsome portières. The rich cretonnes are replaced by faded covers, and the stair carpet which we had so much admired has given place to a green drugget. We are horrified to find that one bedroom has been locked up, thus making us a room short of our calculations, and all the pretty things which we miss have been securely secreted in this chamber. But these are rather the future troubles in store for the house-hunter than his experiences when engaged in the actual pursuit, and it is with the latter that we have now to deal. One of the first of these is surprise at the variety of taste exhibited by the British householder. It is true that there is not much variety in houses which are habitually let. Houses of this class, like habitual drunkards, soon seem to lose self-respect; but there are many houses which are only occasionally let, and these do not acquire that "by the week" or "by the season" appearance which seems to claim for them a relationship to a four-wheeled cab. In the better-furnished houses of the "occasional" type there is plenty of variety to be met with. There is the black-and-gold style, the carved foreign oak style, and the "very respectable" style. There are houses in which Queen Anne reigns supreme, and houses in which the owners' leading idea seems to be crimson velvet. The upholsterers have decorated one house in a style which they are pleased to call Early English, and another in that of the later French Kings. Here we find the heavy mahogany furniture which was the fashion thirty years ago, and there are

comfortless chairs and sofas supposed to be made by the Chippendales. Occasionally we are sent to see a house whose inhabitants are victims to Tudor-mania or a devotion to dingy old tapestry; but worst of all is the house whose owner has filled it with treasures from remote parts of Asia, Africa, or South America. Now and then the house-hunter enters a mansion containing some pretensions to high art. To the ordinary caller this may be rather imposing; but it soon loses its effect upon the man armed with an order to view, as he almost always finds that the high art stops at the first floor, and if the lower stories savour of Christie and Manson, the upper ones are devoted to the productions of the cheaper shops in Tottenham Court Road. Some evil-disposed letters of houses have had the sagacity to discover that there is a style of decoration, much in favour at present, in which dark papers and dark fabrics are leading features, and the use of these affords them opportunities of making an affectation of artistic display, and at the same time concealing dirt. It is little consolation to a tenant to pass his days among æsthetic surroundings, if his nights are to be disturbed by those visitors which landlords of hotels and lodgings always declare that the victim has brought in his own portmanteau. Indeed with regard to the nights it is a pity that house-hunters cannot try the beds before taking a house, as in many mansions which house-agents term "noble" they are extremely uncomfortable.

Although the occupation of inspecting houses when their inmates are at home is far from being agreeable, it affords a certain amount of interest to the observer of manners and customs. He never sees life under exactly the same conditions at other times. Even in his own house he would be unlikely to go into and examine every room, whether occupied by friend or servant. Of course in the houses of his most intimate London acquaintances he usually sees only the reception rooms; but now he enters the homes of utter strangers, and invades them from attic to basement, going into every chamber as if he were a foreign police agent authorized to make a domiciliary visit. Although he is not, like a police official, in search of evidences of crime, he often sees things which are not altogether edifying. He observes ladies in their boudoirs, dressed in uncertain attire, reminding him of the child who had, as her nurse observed, neither washed her face, brushed her hair, nor said her prayers. We have, when on house-hunting expeditions, on more than one occasion, found ladies in fine houses in an untidy and unkempt condition unworthy of their maids; sometimes they were drawing in water-colours with more mess and confusion than would have been necessary if they had been painting in oils; and sometimes they were helping to make *réchauffés* of smart dresses, which afforded a striking contrast to the dowdy and faded attire which they were wearing at the time. In bedrooms we have been much struck by the extraordinary quantity of bottles often crowded upon chimney-pieces, washstands, and chests of drawers, a quantity sometimes rivalled by that of the wretched little pictures with which the walls have been unevenly dotted. In many cases the bed and dressing-room tables have been littered with a curious assortment of little books of devotion and two-shilling novels, and plaster angels have jostled boxes of face-powder.

It would be an endless task to dwell on half the incidents of a week's house-hunting. We should never have done if, for instance, we attempted to describe the varieties of house-agents, from the grand man, who scouts the idea of getting any house fit to live in under eight hundred guineas for the Parliamentary season, to the fatherly old humbug who hopes that we will, if possible, select out of his long list a house which belongs to a widow who has lost money in a bank; or if we entered into the peculiarities of the elderly females who are to be found in charge of London houses, or those of the "house-maids left." As to the vicissitudes of tenants in their after experiences, it would be easy to fill a book with them; but it is unpleasant to treat of painful subjects, and most people can recall unpleasant recollections of "furnished houses." There are, however, in our opinion, people who are even more to be pitied than house-hunters. The occupation of the latter may sometimes be wearying; but they may console themselves with the reflection that in a great many ways it is far preferable to that of tenant-hunting.

COUNT ARNIM ON THE FALK LAWS.

FROM his asylum in Austria Count Henry Arnim has issued a second pamphlet on the Falk Laws. The tone of the former one, *Der Nuntius Kommt*, was rather destructive than constructive. It criticized sharply the existing Bismarckian legislation, but the writer was in turn charged with having failed to suggest any alternative policy. That something must be done to meet the new pretensions of Rome he fully admitted, but how this was to be accomplished without the *Culturkampf*, as it is termed, he did not explain. He still thinks the *Culturkampf* a blunder, and a blunder which sooner or later will inevitably bring its retribution, and in that belief he is of course, as he reminds his readers, far from being singular. We have ourselves often pointed out that it is a common error of statesmen—and especially statesmen of the "blood and iron" stamp—to miscalculate the strength and intensity of moral forces. "A Pope in jack-boots," as Mr. Frederic Harrison once called Prince Bismarck, is apt to be beaten in the long run, though he be the master of twenty legions, and Prince Bismarck himself has so far manifested a consciousness of the danger that he has not refused to enter on negotiations, which are reported still to be pending, with the new occupant of the Papal throne. That he should openly confess himself mistaken in his original policy is more than can be expected even from "the brutal frankness" of so very outspoken a revealer of his own opinions as he has shown himself to be; but such a confession is tacitly implied in the willingness to modify it. Count Arnim however shall be left to state his view of the results of that policy for himself:—

> No one can be more convinced than I am that the Culturkampf must come to an end. It could never be doubted that Liberalism, on entering the combat sure of victory, had once more embarked in the well-known Ship of Fools of the time, which, driven by the winds and wanting a compass, must be wrecked on the rocks of the Church. We were to behold a conflict of heroes, and we have merely seen the scuffling and scratching of cats (*Katzbalgerei*), in which all authority and dignity have been lost. Instead of securing the supremacy of the Emperor over the Church, theory, by the paper majesty of its laws, has sought to establish its governing presence (*Mitregierung*) in the Church. I do not stand alone in this opinion. There is no European country whose soil I have not trod in late years, but I cannot remember anywhere having found a statesman, to whatever party belonging, who recognized the necessary fitness (*Zweckmässigkeit*) of the Culturkampf. To take only one example, Adolphe Thiers to wit:—"I am quite willing to admit," said he shortly before his fall, "that M. de Bismarck is a remarkable man. But what I cannot comprehend from any point of view is his religious policy. He will smart for it; he will smart for it. Write him on my part—no, do not write, but tell him when you see him that he is on the wrong track. And I may here tell you a story. Towards the end of the battle of Waterloo Napoleon was in despair. It was then that a great wag, M. Ouvrard, the contractor, went up to the Emperor and said:—'Sire, the English have lost an enormous number of men.' 'Yes,' replied the Emperor, 'but I have lost the battle.' It is thus that M. Bismarck will have one day to exclaim, 'The Church has lost enormously, but I have lost the battle.' He will smart for it; he will indeed."

It is always easy for a bystander to note the mistakes of the chess-players; it is not equally easy to say how the game should have been played. That is the point dealt with by Count Arnim in his present pamphlet, and there can be no doubt that he makes out, on paper at least, a very plausible case. It will surprise nobody acquainted with his previous career to find him taking, like Mr. Gladstone with us, what may be called a more theological view of the Vatican Council—which he regards as the *fons et origo mali*—than might suggest itself to a man who is a statesman and nothing more. But on that view he bases an elaborate superstructure of political action towards the existing Roman Catholic Church. First, however, he disposes of the suggestions already made by others for putting an end to the conflict. It seems that Herr Reichensperger had suggested three courses by which the *Culturkampf* might be brought to an end. There might be a new Concordat with the Holy See; or there might be simply a return to the *status quo ante;* or the Cavourian principle might be adopted of "a free Church in a free State." To the first of these proposals Count Arnim replies that, apart from the fact that Prince Bismarck would never for a moment entertain such an idea, many of the Catholics themselves would object to it. A return to the *status quo* is rendered impossible by the new aggression of Rome in the Vatican decrees, "which has completely transformed the long-established constitution of the hierarchy." Moreover, simply to abrogate the Falk Laws now would be at once a humiliation for the Empire, and an abandonment of their legitimate object in counteracting the dangerous influence of the Roman Curia on European politics. As to the third method suggested, Count Arnim asks—what is indeed a very pertinent question—whether any one understands what the application of Cavour's famous maxim would practically mean? He says that he himself once observed to Prince Bismarck that it might be translated by "a free Conspiracy in a disarmed State," and if the expression was exaggerated, he still considers that the experience of the English Government in Ireland, since Rome has gained a more complete and direct influence there, goes far to justify his estimate. At the same time he quite admits that the condition of things contemplated by Cavour might become inevitable, and have to be chosen as the less of two evils; and he adds that this is also the opinion of Prince Bismarck himself, who said to him, when the struggle with the Vatican was already in full swing, that the state of things which existed in England and Belgium appeared to him desirable. Count Arnim adds, not unreasonably, that many would find it difficult to build the bridge by which the Imperial Chancellor could pass the gulf between the *Culturkampf* and a free Church in a free State, but meanwhile his statement "affords a conclusive proof that he would not be surprised to find the extreme consequences of his policy lead to an intolerable state of things."

So much for the possible remedies of the actual difficulty. But Count Arnim's main object is to show how the difficulty might have been avoided. And here he goes back at once to the Vatican Council, and repeats the proposal made at the time in Prince Hohenlohe's despatch but rejected by those to whom it was addressed, that the European Governments should have insisted on their right to send ambassadors to the Council. It was abundantly clear that Pius IX. had long made up his mind to give battle to the ideas on which the existing order of States, including Prussia, rests, and they ought to have accepted the challenge. The gain would have been immense if the Pope had lost the battle, and such a result was by no means impossible. But even if the Pope had refused to admit ambassadors, a great point would have been gained, for the King might fairly have forbidden his bishops to

attend an assembly sure to concern itself—as in fact it did—with political questions, while closing its doors against his own emissaries. And Count Arnim thinks that the Prussian bishops would have obeyed such an order. But supposing the Pope had consented to receive ambassadors, they might have told the bishops plainly that, if by their votes or their silence they allowed the constitution of the Church to be changed, their cathedral doors would be shut in their faces on their return home. This would probably have balked the scheme of the Curia. But if the worst came to the worst, and the Vatican decrees had actually been voted, Count Arnim is still prepared with a policy which he thinks would have averted the existing complications. He would have declared that by the new position given to the Pope, "the Catholic Church," with which the State had entered into contracts, "no longer existed," and therefore all ecclesiastical property reverted to the State. And he enters into an ingenious argument, which we cannot stay to examine here, to show that by the canon law and feudal law of the middle ages the *dominium directum* of Church property belonged to the Emperor. But he would have left the present owners undisturbed in the use of it on certain conditions which are thus summed up:—

1. The heretofore Roman Catholic Church, in consequence of the *Pater æternus* Vatican Constitution decreed by the Pope, and accepted by the Prussian Bishops, has ceased to exist. The *Rechtssubject* for the rights of the ancient Church fails. All ecclesiastical property reverts to the State. 2. The State recognizes the Church ruled over by the Bishop of Rome as a legally existing religious society, and assures it the usufruct and management of the means and moneys due and appertaining to the ancient Church. 3. The Cathedral Chapter must choose no one for Bishop without having become assured that he is a *persona grata*. With respect to Cathedral offices and prelacies the existing laws will remain in force. 4. If a Chapter chooses a *persona ingrata* for Bishop, it will be presumed of the Cathedral dignitaries who have assisted in his election that they no longer desire to belong to the recognized Church and that they have relinquished the enjoyment of the incomes appertaining to their posts. The Bishop thus elected will likewise be refused admission into the episcopal residence, and will in every respect be regarded as having of his own accord seceded from the recognized Church. 5. The Bishops are bound to name to the President-Superior every clergyman whom they have to appoint, and to assure themselves that he is a *persona grata*. The aforesaid President shall reject candidates who are not German, and who have not passed the final examination at a national high school. 6. If a Bishop appoints a clergyman without (previously) naming him to the President-Superior, the Bishop as well as the clergyman will be held to have relinquished the enjoyment of the income and the dwellings appertaining to their posts. 7. The stipulations contained in Article 5 also apply to professors and teachers in ecclesiastical colleges (*Seminarien*). These and other educational establishments for the clergy will be subject to State supervision with respect to discipline, domestic order, &c. Those ecclesiastical superiors who resist the agents of the Government in regard hereto will lose their right to draw stipends from the Church. An establishment may ultimately be closed by the President-Superior. 8. Decrees of ecclesiastical discipline carried out by other than German authorities are not valid. Sentences of the same which injuriously affect the fortune of the condemned or restrict his freedom, cannot be executed against the will of the latter. The person in question will be protected by the civil authorities. Prosynodal tribunals will not be regarded as non-German authorities. 9. The *recursus ab abuso* is permitted. The Council of State is the competent authority to deal with the *recursus*. 10. From the retained temporalities a religious fund will be formed, as to the use of which special provisions will be made.

Whatever weight may be attached to the theological or canonical arguments by which this scheme of policy is supported, there can be no doubt that it possesses some obvious advantages over the Falk legislation, while it appears to provide equal security for the rights of the State. It avoids all direct interference with the internal affairs of the Church, while it offers protection to her ministers against tyrannical superiors, in all matters concerning "the man" as distinct from "the priest." And it avoids those punishments for conscience sake which have made the Falk Laws odious, and drawn on them the charge of persecution; for the withholding of temporalities from those ministers of the Church who refused to comply with the civil regulations would not be inflicted as a punishment; it would be simply the consequence of acts disqualifying them for membership of the State Church as such. Count Arnim of course fully allows that Pius IX. would have had no patience with a law which began with denying his rights as the legitimate successor of St. Peter, but he thinks that even he would have eventually come to terms, and adds—what is no doubt true—that there were times when Pius was inclined to yield. One such time is said to have been just before he delivered the Allocution in which Prince Bismarck was compared to Nero or Attila, and Count Arnim, speaking apparently from some private sources of knowledge, says that "the Prince would be greatly surprised to learn how and by whom that Allocution was occasioned." It may be added that the scheme suggested would perhaps not have provoked so much ill will and resistance as the Falk Laws among the Catholics generally, for it would not have had the same appearance of persecution, and would not in fact have made so many martyrs, nor would the martyrdom suffered have been of so serious a kind. There are no doubt those among the Ultramontane party who for this very reason prefer the existing law, the severity of which, and its interference with conscientious convictions will, they think, lead to its eventual overthrow. But Count Arnim is probably right in believing that the pressure on the great body of Prussian Catholics would have been less heavy under the system he advocates, and the danger of ultimate failure proportionately diminished. At the same time the detailed application of his plan would be beset with many practical difficulties. It comes in fact to something very like Cavour's, and thus shares what is shown by experience to be the inherent weakness of all theories of the separation of Church and State. They look smooth and symmetrical enough on paper, and are capable of the most irrefragable logical defence. But somehow or other the attempt to reduce them to working order has never yet met with anything like complete success. And a problem which is found so difficult of solution on the virgin soil of America would certainly not be more easily solved amid the bureaucratic traditions of German imperialism.

DINNERS.

IN the famous scene in *Le Misanthrope* where so many unfortunates are dissected, the pitiless Célimène is specially incisive about a man who has some reputation as a dinner-giver. Clitandre says to her:—

> Mais le jeune Cléon chez qui vont aujourd'hui
> Nos plus honnêtes gens, que dites-vous de lui?
>
> CÉLIMÈNE.
>
> Que de son cuisinier il s'est fait un mérite,
> Et que c'est à sa table à qui l'on rend visite.
>
> ÉLIANTE.
>
> Il prend soin d'y servir des mets fort délicats.
>
> CÉLIMÈNE.
>
> Oui; mais je voudrois bien qu'il ne s'y servît pas.
> C'est un fort méchant plat que sa sotte personne.
> Et qui gâte, à mon goût, tous les repas qu'il donne.

Even if the condemnation was deserved, Cléon's case was not hopeless. If told of the criticism, he could have replied that it was not his fault that he was stupid, but that it certainly would be his fault if his table were otherwise than well served; and he might have added that at all events he did what he could to give pleasure to his friends. Gastronomes in our own time are sometimes made the subjects of criticism much resembling that of Célimène, if not quite so neatly expressed, by people who may be supposed to have come to the conclusion—doubtless on good grounds—that meetings at their houses have intellectual charms which are a quite sufficient boon for their friends, and that it is unnecessary to devote serious attention to the vulgar question of food. The *gourmet* who is thus condemned may make the modest defence which has been suggested, and may possibly say that, judging from a good many of the dinners which are offered him when he goes out, he must have a very fair proportion of brilliant people amongst his acquaintance. Perhaps even he may go so far as to argue that contempt for material pleasures, however worthy a feeling, may be carried too far, and that, without being devoted to gluttony, the masters and mistresses of houses might surely so far consider the arrangement of their tables as to abandon a custom invented in a time of ignorance, and not have their dinners served upside down; for upside down English dinners, when not of a simple kind, almost invariably are.

This may easily be shown to be the fact by comparing them with the French originals of which they are supposed to be a copy. No doubt it may be objected that Englishmen have as much right to arrange how they will eat as Frenchmen have, and that, if they choose to depart in some respects from the French custom, it is not to be assumed that they are necessarily wrong. Certainly people are entitled to take their food in the way that seems best to them, and if a man chose to begin his dinner with apricot tart, no one could blame him provided he really liked such an arrangement; but if it was found that he did this under the impression that he was following an orthodox course, he might be thought rather foolish. Englishmen, when they adopted the French dinner for feasting days, altered it in the point wherein it most closely resembled the English meal, and apparently did not make this change from any original ideas, but because they did not understand the system followed by the French cooks, or the difference in a staple article of diet in France and England which made it to some extent unfit there for the kind of cooking which produced the best results here. The change, then, was certainly not likely to be an improvement; but as the manner of serving a dinner into which it was introduced is still adhered to, it may be well to point out somewhat fully how the alteration was made, and how much it is opposed not merely to gastronomy, but to common sense and to due regard for digestion. The error which the Englishman makes in ordering his dinner has indeed been already very clearly pointed out in one of the most amusing works ever written about cookery, *Kettner's Book of the Table*, and we have spoken of it previously; but there can be no harm in reverting to the subject, as a great deal of expostulation will be necessary before men can be induced to depart from what, according to a tradition now of some standing, is the proper mode of arranging a feast.

The rule of the French kitchen, which for a long time past has been invariably followed in France, is that the most substantial kind of food should be given first at dinner, so that people may eat it while their appetites are vigorous, and that the lighter kinds should follow. It is also a rule of the French kitchen—not now unfortunately followed as strictly as formerly—that the simple flavours should come first and the more marked ones afterwards. In a French banquet, then, just as in the excellent old-fashioned English dinner, the soup was succeeded by large fish and by joints or big pieces of meat, or by substantial birds. These were called *relevés*, because they were put in the place of soup-tureens which were taken

away. "Un nouveau service ou un nouveau plat qui en remplace un autre" is one of the definitions of the word *relevé* in M. Littré's Dictionary, and in old French bills such expressions occur as "grandes entrées pour relever les poissons," "entremets pour relever les salades." For a long time past, however, the term has usually been applied only to the dishes that come next to the soup; and the French *relevés*, sometimes subdivided into *relevé de poisson* and *grosse pièce* are therefore the exact equivalent of the fish and joint of the English dinner. In the cooking, however, there is one important difference. Although the *relevé* may consist of roast, it far more frequently consists of braised, meat, the simple reason for the fact being that French meat, inferior to the English, is much better adapted for braising than roasting. M. Urbain Dubois, in the preface to the English translation of the elaborate work on Cookery written by himself and M. Bernard, explains the reason, while claiming, like a patriotic *chef*, as much merit as he can for the meat of his own country. He points out that in France bullocks are not slaughtered until they are four or five years old, and have gone through a certain amount of work, while in England bullocks are fattened to be slaughtered "as soon as they have attained the requisite qualities." French beef is therefore unfit—is in fact too tough and fibrous, though M. Dubois does not like to say so—for roasting, and requires to be softened by the long process of braising. English beef, on the other hand, being much more tender, is admirably suited for roasting. French mutton is also far inferior to English, and, though more often roasted than beef, is, generally speaking, better when braised. The method of dressing which was found most suited for these two kinds of meat has been followed with others, and naturally enough the practice of the French kitchen has been to braise the joints or large pieces of meat which constitute the first and most solid part of dinner. Naturally enough, also, the same kind of food has in England been roasted, but, subject to this difference, made necessary by the different qualities of what had to be prepared, the old-fashioned English dinner was in one respect similar to the French one. Substantial food was given early in the meal, when people were likely to be able to enjoy it and, we may add, to digest it. This rule, however, which is clearly founded on good sense, and not on any fanciful gastronomic theory, English dinner-givers thought fit to reject when they partly adopted the French system. The fish they retained, but they seem to have been not a little puzzled by the other *relevé* which preceded the made dishes. Rightly enough, they changed the braised meat of France for the roast meat so dear to Englishmen, without which a dinner would have been regarded as contemptible; but, having done this, their good sense appears to have been exhausted, and they wisely proceeded, for some inscrutable reason, to put the meat *relevé*, or *grosse pièce*, some distance on in the dinner, placing it after the *entrées*. By this sensible arrangement the whole scheme of the French dinner was upset, and the advantages of the simple and excellent English repast were also sacrificed. With singular happiness the arrangement of the dishes was made equally objectionable for those who liked dining in the French way and for those who cared only for plain fare. A further merit of this brilliant plan was that a roast immediately followed a roast, in opposition to the fundamental rule of French cookery.

The mistake was probably due to the difficulty which was felt, when dinners after the French fashion were first given, in disposing of the great piece of beef or mutton, accompanied by a mass of vegetables, which had to make its appearance somewhere in the feast. People did not the least understand that French joints were braised because that was the best way of cooking them, and could not see where the proper place for their own big dish was. They saw, however, that there was a *rôt* amongst the French *plats*, and, not knowing that this was a very different feature in a French dinner from what a roast was in an English one, concluded that the sirloin or saddle had better come close to the *rôt*, thus cleverly hitting on exactly the wrong place. This arrangement, caused apparently by pure ignorance, became the fixed rule of English dinners, and it has now been followed for so long, and is regarded as so imperative, that few even of the dinner givers who know better dare depart from it. Yet it is thoroughly absurd, both from the point of view of those who have studied the intricacies of the French system and of those who despise them. The result, as seen at any ordinary dinner-party, is sufficient to prove this. A man who has eaten of two or perhaps three *entrées* has placed before him a great slice of mutton, and immediately afterwards finds proffered at his side a sort of small chaldron, with divisions, from which three kinds of vegetables steam. When, in order to get rid of it for good, he has helped himself, a stern attendant very likely thrusts some salad on him at the point of the bayonet, and this trifling plateful—a meal in itself—he is expected to get through when he has more than half finished dinner. Close to him is perhaps a luckless guest who detests made dishes, and would have liked to have dined off fish and roast meat; but he has had to wait so long for the latter that, when it comes, he has no appetite for it. There is certainly singular felicity in the arrangement so well calculated for every one's discomfort. Will no gastronomic reformer arise sufficiently eloquent to gain the ear of the many hospitable and clever people who give dinners, and to persuade them not altogether to despise the science of the kitchen, and to direct a little of their overflowing wit to the manner in which those feasts are served to which they bid their friends?

If it be asked whether the principal feature in an English dinner can really be introduced into a French one without producing a ridiculous and incongruous meal, the answer is that this was done long ago by the greatest of all French cooks. Carême worked a good deal for Englishmen, and on several occasions took no small trouble to modify the French system to English tastes. To most people who have heard of this cook, his name probably suggests nothing but vanity and the most silly grandiloquence. Very vain and grandiloquent he certainly was, but perhaps this was not unnatural in a man who, springing from the dregs of the people, found himself sought by kings and emperors. Despite the nonsense which he frequently talked, he was a person of considerable intelligence and of most remarkable energy. Beginning his career at a wretched *cabaret*, he rose to be the first cook in France, and contrived, while slaving hard in the kitchen and mastering his business in the most thorough manner, to educate himself and to learn how to draw. He devoted immense attention to the best way of arranging dinners, and sometimes when he cooked for Englishmen he showed the versatility of a really great *chef* by introducing the mighty English roast, with its accompaniments, into the French dinner. But he did not put it near the end of the meal, after the absurd fashion now followed. He simply substituted it for the braised *relevé*. The following, for instance, are the beginnings of four of the dinners which Carême cooked for English patrons:—1. *Purée* of pearl barley, sturgeon stuffed in a peculiar manner and served with *maître d'hôtel* sauce, and saddle of mutton served with a *purée* of potatoes. 2. Very light green-pea soup, fish with Dutch sauce, and roast beef. 3. Turtle soup, trout served in a manner of his own, and fillet steaks with a full brown sauce. 4. Light white soup flavoured with celery, pike with brown sauce, and roast beef. Such were the first portions of some of the repasts devised by Carême for Englishmen, to whom he offered after their fish either roast meat or else the one other thing equally liked by them, broiled steaks. Of course in each of these dinners *entrées*, *rôts*, and *entremets* followed in due course; but we have not given them, as our intention has been merely to show how Carême met the difficulty of introducing the principal feature of an English dinner into a French one. This very skilful and intensely conceited French cook would never have sent in the English joint as a *relevé* or *grosse pièce*, if he had thought that doing so was contrary to the principles of what he looked on as a beautiful art; and in such a matter his authority may fairly be looked upon as indisputable. The severest principles of gastronomy and common sense are therefore at one, and there is no conceivable reason why the English national dish should not be restored to the place at feasts from which it has been wrongly degraded.

ENGLISH COMPOSITION.

PROFESSOR NICHOL is a bold man. In a little book, so cheap that every one can find money to buy it, so short that every one can find time to read it, and so clear that every one can find brains to understand it, he makes a daring attempt to destroy one of our best-established industries. He aims at teaching people to write briefly and clearly. Since the days of the Clerk of Chatham we doubt whether a scholar has been caught who has more deserved to be hanged with his pen and ink-horn about his neck than this Glasgow Professor. It is true enough that he can plead that he is not the first who has been guilty of the same attempt. Others, we admit, have attempted to teach the art of brief and clear composition. But he will not find his plea of any avail. The whole circumstances of the case are changed since their time. Had he lived a hundred years ago, or even fifty, he could have done little harm. Men could write briefly and clearly then without the risk of bringing whole industries to utter ruin. We beg him for one moment to consider what would be the sure result should his teaching be followed. He aims at imparting, among other things, simplicity, brevity, and precision. He would do away with roundabout, inflated, or pedantic words or phrases, with tautology, pleonasm, and verbosity, with ambiguity and obscurity. Good heavens! we exclaimed, has the man no heart? What will become of our novelists, our special correspondents, our leading-article writers, our poets, and our penny-a-liners? How are sermons to be composed, parables to be expanded, speeches to be made in Parliament, and letters to be written to the *Times*? How many printers, and printers' devils, and paper-makers, and ink-makers, and newsagents would be starved to death in a month by his simplicity, brevity, and precision. Let him follow in his mind the almost countless trades besides those we have mentioned which are connected with printing, and let him reflect what a blow he wishes to strike at these honest industries. Let him consider how many honest workmen would have their livelihood taken from them should one of our popular novelists—Miss Braddon, for instance, or Mrs. Henry Wood—give up the use of inflated phrases, pedantic words, verbosity, and the rest. At once their three volumes would be cut down to one. They have between them produced, at the very least, a hundred and twenty volumes. It is certain that, had they written under Professor Nichol's guidance, they could have said all they had to say in just one-third of the space. And how hard would have been the fate of those who have made a living by printing these eighty superfluous volumes! When we consider the great demand there is for

these ladies' writings, and the thousands of copies that are printed of each of their novels, we ought surely to hesitate before we strike a blow at so vast an industry. Johnson, in criticizing the style of a bad writer of earlier days, said that, "were a man to write so now, the boys would throw stones at him." Were we all to begin to write as Professor Nichol tells us, then, as the master-printers for want of business turned off their men, there would, we fear, be plenty of stone-throwing. Let us hope that it will not be our heads, but the Professor's, as the real source of all the mischief, that the young printers' devils will take as their mark. He has never, we feel sure, had to edit a daily newspaper, for he would have learnt by experience how true to nature is Fielding when he likens a newspaper to a stage-coach which has to travel the same journey whether it is full or empty. Now it is by verbosity that the columns are always kept full, and that a naked look is avoided. When there is an over-abundance of news, what can be easier for the editor than to give notice to his subordinates to strike out every second substantive and two adjectives in every three? Everything is told that needs telling, and no piece of news of any importance is left out in the cold. On the other hand, when a slack time comes, when no mail has arrived from the Special Correspondents in India, when criminals have been quiet, and neither trains nor steamers have come into collision, then the opposite order goes forth. Substantives that day run in pairs, and adjectives are yoked together like the horses in the tramway-cars.

It is a pity, however, that the necessities of modern life do not allow us generally to follow the advice given in this little *Primer of English Composition*. Were it not for the blow that it strikes, as we have shown, at one of our most important trades we could heartily recommend it to young writers. To recommend it to old writers would be useless. The more they read it the less they will be likely to turn it to use. We should like, indeed, not from any belief that it would do them any good, but from a desire for a mild revenge, to have the power to sentence our female novelists to learn it by heart. They have so worried us by their bad English that we should be glad in turn to worry them by making them study good English. But, after all, the end of punishment, as some philanthropists tell us, is not vengeance, but reformation, and reformation we feel in their case is hopeless. There are, however, not a few by whom this Primer might be studied with great advantage. For instance, were it used as a text-book in our schools it might possibly teach the masters to speak with some approach to correctness. It has been noticed that ever since these gentlemen shook off that awful pomposity which was once as much the mark of a schoolmaster as the gold-headed cane was of a physician, they have fallen in their talk into the use of the most slovenly English. They seem to have entered into a kind of compact with their pupils that, in return for teaching them Latin and Greek, they should themselves be taught slang. We see that a warning is given by Professor Nichol against using some of the common English vulgarisms, among others "exam." It is but a few weeks since we heard of a father writing to his son at school to ask him whether he was so hard worked that he had not time to write "examinations," but cut it down to "exams." The lad modestly enough answered that the master always spoke of the "exams," and so he thought it was the proper word to use. "Awfully nice" is another of the expressions which the young reader is warned against. We fear that nothing can drive awfully, and terribly, and tremendously and frightfully back to their proper uses. We were present a week or two ago when a fond mother lamented that her child would say "awfully jolly." "It is," she pathetically said, "so tremendously exaggerated." We are surprised, by the way, to find included among these vulgarisms such phrases as "currying favour," and "they fell out." To "curry favour," is not, we admit, an expression which we much like. It can, however, as we see by Johnson, plead the authority of Hooker and L'Estrange, while "to fall out," in the sense of "to quarrel," is so good a piece of English that it needs no dictionary authority to uphold it, though plenty could be produced. Neither has it, we hope, become one of those obsolete terms which, as Professor Nichol points out, it is so much the fashion to attempt to drag back into life. Among the most frequent sources of barbarism which he notices, he does not give, by the way, the use of what we may perhaps call pet words. Most writers, as has been often noticed, have certain words to which they give an unfair preference. But beyond this, each age also has its favourites. Thus "factor" and "outcome" have shot up in a most wonderful way within these half-dozen years; and the barbarous affectation of "cultured" has grown to the dimensions of a common nuisance. Again, a hundred years ago, those whom we now call clever were all "ingenious," while "respectable" held a position far above those who keep a gig. It was very widely applied, and was in fact in high favour. Madrid was described as a respectable city, the aged Lord Mansfield as a respectable visitor, while Chesterfield in writing of the hour of death said, "That moment is at least a very respectable one, let people who boast of not fearing it say what they please." A writer of the present day would perhaps contrive to make "notable" supply most of the senses in which respectable was used by our forefathers. He would write of a notable city, a notable visitor, and the notable moment of death. This word and its adverbial form, notably, have indeed shot up into favour in the last few years with astonishing rapidity. The rise of "tender" has been sudden, but it is chiefly confined to people who criticize art and poetry, while notable and notably are favourites of all who write. [illegible] in the spoken language. Notable had once fallen so much out of fashion that Johnson in his Dictionary says that it is now scarcely used but in irony. In Northcote's Life of Reynolds there is an amusing instance of the double signification of the word. He had, he said, long wished to see Goldsmith. Sir Joshua suddenly introduced him to the great writer, saying, "This is Dr. Goldsmith; pray why did you wish to see him?" "I was much confused," writes Northcote, "by the suddenness of the question, and answered in my hurry, 'Because he is a notable man.' This, in one sense of the word, was so very contrary to the character and conduct of Goldsmith that Sir Joshua burst into a hearty laugh, and said that Goldsmith should in future always be called the notable man." In fact, to any one who is at all familiar with the writers of last century the present use of "notable" often has a somewhat comical appearance. He remembers how Mrs. Primrose "was a good-natured notable woman. She could read any English book without much spelling; but for pickling, preserving, and cookery none could excel her."

Useful is the warning—would that it were likely to be followed—that Professor Nichol gives against the use of foreign words. "Coleridge," he writes, "and others are wont to use Germanisms, as *Vernunft* and *Verstand*, to veil a confusion of thought. They think that certain distinctions cannot be expressed in English; being imaginary, they cannot be expressed at all." It is not, we feel sure, to any wish to veil a confusion of thought that the use of foreign words is due among most of our writers. Like savages who have managed to pick up a few articles of foreign finery, they are merely anxious to make a very harmless display, and to dazzle the eyes of their less fortunate countrymen. If the truth were once generally recognized that the more a man knows of a foreign language the less he is likely to mix it up with his own, we should soon be free from the jargon in which the novelists and special correspondents above all so much delight. For his instances of incorrect sentences Professor Nichol has searched far and wide. Not a few writers of some renown will, we fancy, find in his little book some of their careless sentences carefully corrected. In no case, however, is the author's name given. We do not know whether, among the examples of mixed metaphors that he has selected, there is any one quite equal to the following, which was last autumn brought before our notice:—"The harvest season is now near, and it is time to unleash the dormant sickle." The following, however, has a humorous touch about it which is irresistible:—"When even an archbishop began to *hold his nose*, and to complain of the air being poisoned in the vicinity of his palace, the *pressure* became irresistible." The ambiguity of the following phrase is amusing enough:—"A self-made man arrived in California with only one shirt to his back, and since, he has contrived to accumulate over ten millions." It is a great pity that grammars, whether English or foreign, are not enlivened by such touches as these. If the hard terms of the Public School Primer—those learned absurdities, if we may so term them—were turned out, and a few of these unlearned absurdities were put in, how much easier would be the task both of pupil and teacher. Grammars would cease to be dull, and would be studied to some effect. But then, in that case, all those injuries would most certainly be done to trade which, as we have already pointed out, in some degree threaten us from the publication of even so unpretending a little work as this *Primer of English Composition*. It is better surely to have pedantry, tautology, and verbosity in our language than half-starved printers and paper-makers in our streets. We can with greater patience see the Queen's English misused than the Queen's subjects brought to ruin.

NATAL AND THE ZULUS.

SINCE the suppression of the Caffre outbreak in the Cape Colony, Natal has become the centre of political and military activity in South Africa. Owing to the recent absorption of the country of the Pondo Caffres, which intervenes between the Cape and Natal, the British dominions now extend continuously from Table Bay to the Tugela River, the frontier of Zululand. Natal thus at present becomes the outpost of civilization in contact with the Zulu power, the bulwark of barbarism. Military head-quarters and all the available regular troops have in consequence been transferred thither, leaving the Cape Colony to provide in a larger measure than heretofore for its own internal security. This movement was inevitable, since, whatever the projects conceived by the Zulu King, it would be manifestly imprudent to confide in the constancy of his feelings and intentions. Sir Bartle Frere, as Her Majesty's High Commissioner, has recently taken up his residence at Pietermaritzburg; and during his stay he will doubtless adjudicate on the various questions pending between our Government and the King. He may subsequently proceed to the Transvaal to regulate the affairs of that recent and costly acquisition of the British Crown, where not only civil discord is rampant, but the Caffres of Secoceni have once more flown to arms. Ensconced in their inaccessible strongholds about the Olifant River, and powerfully aided by prevalent drought and disease, they have hitherto held their own. It is matter for serious reflection that the services of two entire British battalions should be engrossed in operations against this insignificant foe.

The ordinary reader who takes a cursory interest in news from distant provinces of the Empire can form but a faint idea of the nature of the crisis through which South Africa is now passing. At the conclusion of the war in the eastern districts of the Cape Colony, it was perhaps hastily assumed that the fires of rebellion had been extinguished. On the contrary, recent disturbances appear to have been but the prelude to more formidable difficulties. Vast masses of natives are seething under the influence of a vague impression that the hour long foretold has sounded when the white intruder shall be chased into the sea. The powerful Zulu King, with his forty thousand warriors, is naturally looked up to as the champion of the national cause. These again, never having as yet experienced defeat at the hands of Europeans, are deeply imbued with the sense of their own strength which is due to uninjured morale and formidable numbers. It is to be apprehended that the strength of Her Majesty's troops now present in Natal is barely adequate to cope with this emergency, since the population is so scanty that volunteers cannot be obtained in any great numbers, as in the Cape Colony. The occurrence of even a trifling mishap to our troops would be inevitably magnified by native report, and might possibly result in Caffre risings on an extended scale. It is to be hoped that no considerations of false economy will be allowed to lead to such destructive consequences.

Within a very short time the question of peace or war with the Zulus must be decided. The King, having concentrated all his available forces, has rendered corresponding movements for the protection of our frontier indispensable. An accident may in this, as in all similar cases, precipitate the final rupture. Our demands on him will, moreover, no longer be confined to the acceptance of the award of the Commission of Arbitration in the disputed territory about the Blood River. Various acts of outrage proceeding from the King or his subjects, with or without his cognizance, have been committed during the last few months. On one occasion two women, who fled across the border to seek asylum on British territory, were pursued thither and brutally murdered. On another, a surveyor was seized near the border by a band of armed Zulus; and, though ultimately released, did not escape without rough treatment. Outrages of this description demand prompt and condign retribution; and, unless amply repaired, constitute a case of war legitimate enough to satisfy the most determined stickler for principles that are totally inapplicable to existing circumstances. The great natural abilities and craft of King Cetewayo are unquestionable, and, were his actions unfettered, he would doubtless be loth to engage in a struggle with the English. Yet, like more renowned potentates in Europe, he may be forced into war in order to save himself from the more pressing perils of internal revolution. There is said to be a powerful party in Zululand which supports the pretensions of the King's brother, Uhamu, to the crown, and it is considered probable that, in the event of war, this body would separate itself from the royal cause. It is, on the other hand, conceivable that, by appealing to the national sentiment, the King may unite his various chiefs in a common effort against the foreigner. A variety of motives, difficult of appreciation to all but persons intimately versed in Zulu politics, will thus influence his decision. But, even were he to accept the award of the Commission of Arbitration, and also to grant ample reparation for the insults offered to British territory, it has now become a question whether the Government would not act prudently in proceeding a step further in the interests of the peace and security of South Africa. The forty thousand warriors of the Zulu King constitute a standing menace to our dominions in that quarter of the globe. Even in Europe the maintenance by a neighbouring Power of an army of corresponding strength would lead to diplomatic explanations and perhaps eventual hostilities. A summons to disarm would, under these circumstances, not be opposed to the principles of international law, while it would tend to promote civilization amongst the Zulus themselves, and would accomplish an indispensable stage in the consolidation of our South African dominions by removing a constant menace to their peace and security. Should the requisite authority and means be conceded by the Home Government, measures will doubtless be taken to place the prosperity of Natal upon a permanent basis. In any case, a strong garrison of regular troops must be maintained for many years to come in the colony, to guard involuntary conquests, and coerce populations indisposed at the outset to accept the benefits of British rule.

Adverting to the Transvaal—so intimately connected with Natal that the two colonies may for most purposes be considered as one—we see the administration hampered by civil discord and commotion, as well as annoyed by Caffre aggression. It is asserted, and not without show of probability, that the natives have been incited by discontented Boers to take arms against the British Government. The tribes subject to Secocoeni occupy a most difficult country, and appear to imitate the dilatory tactics of the deceased Sandilli when established in his fastnesses in the vicinity of King Williamstown. Our troops have been compelled to retire from the chief town of the tribe, owing to dearth of water and the ravages of a pestilence which attacks horses with extreme severity. Thus active operations have been suspended until the arrival of a more favourable season and sufficiently copious falls of rain. All over South Africa the severity of the drought has multiplied indefinitely the difficulties usually attendant on supplying bodies of troops at a distance from their base. The land is literally baked up, and a uniform brown tinges the country, which should now be clad in the green of spring. The grass is withered, the springs are dried up, and oxen, the draught animals of the country, can find no sustenance. The movement of troops has thus become a difficult operation everywhere. Meantime the obstacles encountered in the civil administration of the province by Sir Theophilus Shepstone have been considerable. If it may be conceded that the policy he carried into effect was somewhat high-handed, it is nevertheless certain that in this matter he received the countenance of a large section of the population, including its most respectable citizens. Many of these were Englishmen who, having acquired property in a distant land, were desirous that the British flag should guarantee to them its undisturbed enjoyment. Others, with fortunes still to make, hoped that the establishment of British rule signified increased expenditure and an extension of trade and commerce. But the most troublesome of the friends of the new order of things were adventurers actuated by delusive hopes of lucrative employment, and filled with exaggerated notions of their own capabilities. From such unpromising material nothing could in the long run be looked for, as the event has proved, but annoyance, covert intrigue, and unmerited abuse. Sir Theophilus Shepstone, having educed comparative order out of this chaos, and secured some respect for the law, may justly claim admiration for his administrative talents.

It may fairly be urged that considerable progress has been made during the past eighteen months in laying the foundations of the future South African Confederation. Time, as in all such cases, is requisite, and indiscreet haste might prove ruinous to the whole scheme. Still more indispensable is it that the needful support should be accorded by the Government to those engaged in its execution. British interests in remote corners of the Empire are apt to be neglected till some striking disaster startles the public mind; nevertheless, as we are an Imperial people, we must pay ungrudgingly the price of empire. Though the outlook is clouded, so far as foreign affairs are concerned, internal politics are in a satisfactory state in the leading colony of South Africa. The Sprigg Administration has proved equal to its duties, the Cape Town Parliament has been dissolved, and Confederation will be avowedly the test question at the approaching elections.

TRADE PROSPECTS.

At the beginning of a New Year it is natural to try to forecast the immediate future. The depression of trade has now lasted nearly five years and a half. In the beginning it was little more than a slackening of the too rapid pace which had been kept up for some time previously; but things have gone from bad to worse until at last a portion of the working-classes are involved in actual distress. Is the depression likely to continue much longer, or may we expect an early revival? It is in itself a favourable omen that the majority of those who venture to give an opinion on the subject are inclined to take a reassuring view, and that the most competent are certainly not the most despondent. Nor is it difficult to find grounds for hopefulness. We have just passed through a financial crisis of extreme intensity, which gave a shock to credit such as has rarely been experienced. Last week we pointed out the effect of this crisis in aggravating the depression, yet outside the banking circles immediately affected by it there has been only one failure of real magnitude. We do not wish to draw from this circumstance a wider inference than the facts justify. The crisis was financial from first to last, and, except in the indirect ways which we explained last week, did not at all affect trade proper. Besides, it is always rash to conclude that everything is safe merely because unsoundness has not been brought to light by occurrences which may have seemed calculated to detect it. Still it is a fact of some significance that, in a period of protracted depression, an extreme shock to banking credit, resulting in an extraordinary and sudden restriction of the accommodation upon which business always reckons, has thus far produced no commercial bankruptcies worth speaking of. The presumption is that trade generally is sound, and is being conducted on prudent principles. If this presumption be well founded, there only needs a revival of confidence and an increase of consumption to bring back more prosperous days. As regards the first condition, it is in the way of being rapidly fulfilled. The banks are relaxing their rigour, the rates of money are easier, and if we have no more failures like those witnessed during the past few months, we may fairly hope to see credit re-established in a very short time. All this of course depends upon contingencies which may or may not happen, but, at any rate, the apprehensions which of late prevailed so strongly are allayed.

As regards the increase of consumption, likewise, there are several encouraging symptoms. To begin with the Revenue Returns published on Wednesday, we find at last an increase in the yield from Excise. The Excise revenue was the first to feel the depression; it has been decreasing for a couple of years, and it continued to decline through the summer and autumn. The last two months, however, show an improvement, as compared with the corresponding period of last year. It is true that the Returns, taken as a whole, are at the best neutral; that Customs, the other great index of consumption, do not show a favourable result; and that Stamps are decidedly unfavourable. But Stamps are the index to the amount of business done, whereas we are now inquiring into

consumption and the fact that even one of the great branches of revenue dependent on the consumption of dutiable goods gives evidence of recovery is, so far as it goes, encouraging. The inference suggested by the Excise figures of the past two months points to improvement in the condition of some part of the population, and the late harvest tells us where to look for that improvement. The past year was favourable to agriculture. The grain harvest, as a whole, was good; the green crops, hay and grass, were excellent. A single year does not make up for three bad ones; but, in spite of many adverse appearances, the agricultural classes are better off than they were, and there is a more hopeful feeling amongst farmers. Even a slight improvement in our greatest industry—for such agriculture is beyond all comparison—would be calculated to produce a great result. No small part of the existing depression is due to the poverty of the agricultural classes in consequence of three years of deficient harvests, bad hay and root crops, and serious cattle disease. They are now better able to support manufacturers by their purchases. But perhaps the most influential of all the forces working towards a revival of trade is the almost unprecedented cheapness of bread. According to the *Gazette*, the average price of wheat throughout England last week was only 39*s.* 9*d.* the quarter. The present generation has never before seen the price below two pounds. The importance of this extraordinary cheapness can hardly be overrated. Wages which only twelve months since would have barely sufficed to provide a family with bread now furnish a surplus of about one-third for other outlay. In other words, two shillings go very nearly as far in buying bread as three shillings went a year ago. Considerable as has been the fall of wages, in the interval, it has not been in anything like this proportion. The working classes, therefore, are better off than they were twelve months ago, when they are in employment. That is to say, they have a greater command over the necessaries and comforts of life; or, to put the matter more correctly, after providing themselves with their staple food, they have a larger surplus to lay out upon other things. Notwithstanding all that we hear about distress, there is no reason to believe that, outside a few trades, such as the iron and cotton, any more than the surplus labourers have been discharged—namely, those who are taken on in active and dismissed in stagnant times. Assuming these to form a tenth of the whole working population, the remaining nine-tenths have the means of spending more largely than before with the grocer, the beerseller, the shoemaker, and the butcher. All these tradespeople benefit by the increased expenditure as well as by their own reduced bread bills, and in turn become better customers of the dressmaker and the tailor. Thus the current of increased outlay is diffused through every branch of trade.

The very depression itself has been slowly preparing the way for the revival which we are all so anxiously awaiting. In the period of inflation that followed the close of the Franco-German war prices were run up to an exorbitant height. Everybody believed that he was rapidly becoming rich, and that every one else was in the same enviable road. Everybody, therefore, was ready to trust everybody else; and loan after loan was floated for all sorts of adventures—public, corporate, and private. By means of these loans and by the reckless use of credit prices were inflated beyond all reasonable limits. The crash came and prices fell. Naturally it was in manufactured articles that the fall first occurred, but gradually the raw material followed. Then came the struggle to readjust wages. In the inflation period they had gone up, like everything else; very naturally the workpeople were unwilling to lose what they had gained, and they foolishly attempted to prevent the inevitable. Strikes followed in great numbers, inflicting unavailing suffering on the workpeople, adding to the losses of the country, and deepening the depression. They were unsuccessful, of course, and now the necessary readjustment of wages is nearly completed. When it is fully effected, our manufacturers will be in a position once more to take their old place in the world. The prices of manufactured goods are as low as is needful; those of the raw material also seem not to admit of further reduction; and when wages and hours of labour are readjusted so that the cost of production will allow of profitable sales at existing prices, the main difficulty under which our manufacturers have laboured will be removed. It has often been contended by the Trade-Union leaders that cheapness does not stimulate consumption, that the public wants only a certain quantity of a given article, and that it will not be tempted into buying more by a halfpenny or a penny being taken off in the yard or the pound. The recent experience of the Eastern trade refutes this argument. All the world knows that India and China have suffered grievously from famines which have lessened the purchasing power of the populations. Nevertheless the export of cotton goods has gone on from this country, prices have been reduced below the cost incurred, and a larger quantity has been disposed of in the past three years than at any former period. This has been accomplished at a loss, but the material point in our present contention is that cheapness did in fact stimulate consumption. The problem for the manufacturers is to reduce the cost of production until the loss disappears; and then they will be able to push the trade to advantage. There are many signs that the problem is advancing towards solution.

One other favourable circumstance remains to be noted. For nearly four years the Eastern question has kept Europe in anxiety and apprehension. Traders were afraid that a general war might break out, and they did not dare to embark their capital in any enterprise that would extend over much time. They lived, therefore, from hand to mouth. Besides, if war had broken out, apart altogether from blockades and risks at sea and loss of markets, all national energies would have been diverted into what we may call the belligerent arts—shipbuilding, cannon-founding, riflemaking, and the like. Lastly, financiers foresaw vast loans opening prospects of indefinite fortunes. While the fear of war lasted, therefore, any real revival of trade was impossible. But the improved political prospect alters the situation. If the Treaty of Berlin is carried into execution, a period of repose may reasonably be calculated upon, and enterprise will be stimulated. The prolonged suspense has given time for stocks generally to run down, and there is probably, therefore, a void to fill. In any case the newly-felt relief will be a spur to activity. When the Berlin Treaty was concluded its influence upon commerce was very distinctly felt, though it was soon checked by the political suspicions which sprang up, and by the bank failures that occurred in more than one country. Should these suspicions be eventually proved to be unfounded, we may reasonably trust to see the hopes of last July realized in the New Year. The decided improvement already manifest in the United States cannot fail to cooperate towards this result. The bountiful harvest with which they were last year blessed, the vast European demand for the produce of their soil, the enforced thrift of recent years, the greater industry necessitated by adversity, and the reduction in the cost of production brought about by the lowering of wages, have at last terminated the distress from which the Americans have so long been suffering, and they are now to all appearances entering upon a fresh period of prosperity. This will naturally react upon ourselves, and the resumption of specie payments which is now a fact will make the trade between the two countries less speculative and more sound.

THE GROSVENOR GALLERY.

IT was to be expected that the subsequent winter exhibitions at the Grosvenor Gallery should not quite come up to the exceptional excellence of the first, but as yet there are hardly any signs of falling off. The old mines are still yielding apparently inexhaustible supplies of art treasures, whilst new ones are discovered of scarcely inferior richness. Although there is nothing to equal the unrivalled series of Lionardo drawings lent last year by the Queen, yet an almost unknown collection, belonging to Christ Church, Oxford, has been laid under contribution for examples of that master and of others, with results of the highest interest; whilst the Earl of Warwick, Mr. Malcolm of Poltalloch, Mr. William Russell, and other former contributors, are amongst the most prominent supporters of the present exhibition. With the exception of Raffaelle and Holbein, all the great masters are well represented—the Dutch school in particular; and to show, we suppose, that the old painters had not a monopoly of good drawing, a whole room is devoted to the studies of M. Ingres—a somewhat cruel kindness. When we add to all this a carefully selected and really representative collection of water-colour drawings by living English artists, it will be seen how much the Grosvenor Gallery has done for the lovers of art.

Without wasting our time on productions fancifully ascribed to Cimabue and Margaritone, we will begin our review of the Italian schools with that earliest of the great masters of the Renaissance, Masaccio—a man who was so much in advance of his age that we can very well believe him to be the author of the "Figure of a Youth" (40), which, in the case of its attitude and the perfection of its drawing, would seem to belong to the greatest period of art. This, and another study of a "Young Man Reading" (59), may in their unaffected truth to nature be instructively compared with the pseudo-classicism of Mantegna, who joined to great powers of design and composition a total inability to draw living people. Of this master there are many very interesting examples; perhaps the finest is a "Design for a Chalice" (35), which, for delicacy of execution and richness of invention, could scarcely be surpassed, although his imperfect drawing is revealed in the surprising badness of the perspective. "Hercules Slaying the Lion" (14) is a specimen of his most vigorous drawing and design; and "The Entombment" (28) is an important example of his ordinary style, a style in which the figures look like old statues suddenly galvanized into violent movement, and which, in spite of his imitation of antiquity, is deficient in the simple grace and harmonious proportion that distinguished all Greek art. A fine series of prophets and sibyls, lent by Mr. Malcolm, are certainly not by the master himself, but are excellent works of his school.

Verocchio was another artist who made a diligent study of the antique. In No. 642 we have various studies of proportion (mostly drawings of old statues) which he is said to have made for the benefit of his pupil, Lionardo da Vinci. He appears to have adopted two standards—one the length of the hand, ten of which made up the figure, which was also divided into eight parts, each the length of the foot. What sort of progress his pupil made may be seen in the drawings unearthed from the gloomy recesses of the Christ Church portfolios, where they have remained ever since General Guise bequeathed them in the last century, and into which we trust they will never again return. The finest of these is certainly the Portrait Study (88), the sex of which the Catalogue has cautiously left undecided, but which, in spite of the somewhat feminine features, we believe to be male, the form of the cap alone being sufficient to decide this. Nothing more refined and, at the same time, firm and vigorous has ever been done

in portraiture, the only fault to be found with this magnificent drawing being a certain over-blackness of the pupils, probably retouched. The large cartoon (64) has apparently been much injured. The heads are beautiful, and undoubtedly by the master's hand; but there is something hopelessly wrong about the figure of the Virgin. No. 90 is a study of drapery less elaborate than the famous one at the Louvre, but quite as exquisite in its finish and delicacy. The "Study of a Head" (92) is very lovely, but scarcely powerful enough for Lionardo. It may perhaps be ascribed to Luini. After these drawings, it is cruel to turn to the mannered grace and facile execution of Correggio, who is, however, very well represented. Nos. 106, 113, and 117 are studies for the famous cupola at Parma. Perhaps the best of his work is a very beautiful, but rather faded, sketch of three Amorini (120). No. 124 is a good study of a sleeping child.

Turning to the Venetian school, we get some admirable examples of that rare master Giorgione. Nos. 136 and 140 are both landscapes with figures, executed with the point of the brush, and not with the pen, as was Titian's custom. Perhaps it is partly owing to this that they have a softness and refinement to which the latter master never attained, the distance—especially in 140—being of an almost inconceivable delicacy. As compositions they are both of them admirable, the figures appearing in perfect keeping with the landscape, which again has more an air of nature than one ever finds in Titian's studies. No. 132, which is ascribed to Giorgione, may perhaps be the work of some other great Venetian—perhaps Palma Vecchio—but it is in any case a most delightful drawing, with the air of richness and sumptuousness that is typical of the school. Of Titian himself we have nothing quite worthy of the greatest painter (though not the greatest draughtsman) that the world has seen. No. 130, evidently the head of the woman called Titian's daughter in the picture at Madrid, is probably by a pupil, though a fine bold work, but 133 is undoubtedly a genuine specimen of Titian's freest and most spirited manner. The Venus has a sort of healthy robust grace, very characteristic of the master. No. 138, "A Study for the Peter Martyr," is merely a coarse piece of effect, quite unlike Titian's execution, and 131 is a rather commonplace example of his ordinary landscape work.

Before we leave the Italian pictures we must go back to a very curious sheet of studies of men hanging by Andrea del Castagno (403); they are supposed to represent the Pazzi conspirators, whom, according to Vasari, Andrea painted outside the old palace in the very places where they were hanged. But Von Reumont entirely disposes of this story, declaring that Andrea was dead long before the conspiracy, and that the frescoes were really painted by Botticelli. These drawings, however, are certainly not by Botticelli, and may very well be by Castagno. Vasari says that the Pazzi conspirators were hanged by the heels. The drawings represent men hanging by the neck, so we should doubt their referring to this celebrated conspiracy.

We have already said that the Dutch school is very well represented. Of Rembrandt there are numberless examples—many of them very fine. Among the most interesting are two sketches of "Christ Walking on the Sea" (292 and 299), in the latter of which the composition is immensely improved; the figure of the man getting out of the boat being singularly natural in its unaffected awkwardness. There is a sheet of heads (309) which show to perfection Rembrandt's powers of vigorous and subtle portraiture. No. 302 is a very characteristic study of the nude; whilst 305, a roughly-sketched female figure, has a certain charm in the face and limbs that one does not generally look for in Rembrandt. There are also many excellent examples of his landscape work—amongst others a charming sketch in water-colours (209). Rubens is seen at his best in his masterly portrait of his wife (158). She has a sort of exuberant dignity which was the nearest approach to feminine beauty that Rubens ever made. Very fine and bold is his "Portrait of the Earl of Arundel" (163); whilst his "Studies of Venus and Cupid" (165) show how refined his execution (though not his outline) could be when he liked. No. 176 is a very interesting drawing of his after a Bacchus of Mantegna. It is curious how human Mantegna's figure has become, and also how vulgar. Vandyke is fairly well represented. No. 181 is a study in red chalk for a celebrated etching in the "Icones." No. 187 is a good portrait, but the best of his drawings here is undoubtedly the life-sized head of "The Duke of York when a Child" (269). Frans Hals and Terburg have each a good portrait study (236 and 250). The one is excellent in its bold freedom, the other in its refinement and precision. The landscape-painters Cuyp, Berghem, Ruysdael, Van der Velde, are numerously represented; but we can do no more than refer to them.

Passing from the East Gallery to the Vestibule, we come again to the Italian school in the person of perhaps its greatest representative. There is a life-sized cartoon by Michael Angelo (490) at the end of the room, very dark and much injured, but still grand and powerful. The figure on the left especially is in his best manner—the one representing "Charity" appears less happy, but it is very difficult to make out properly. Of the smaller drawings there is one of the highest excellence. The studies for the Dead Christ (495) have a beauty of line such as Raffaelle never attained. In these drawings there is no exaggeration, no straining after effect, but simply the beauty of consummate draughtsmanship, with a tenderness of feeling very unusual in Michael Angelo. A Holy Family (496) is a fine example of his most elaborate drawing, but it looks a little retouched. The rest of the Vestibule is filled with the works of the French school. The Claudes are very fine, but there is nothing else of much interest, save some portraits by Dumoustier, and these are very unequal.

In the sculpture gallery we come to the Raffaelle drawings. These are few and of no great merit; the best being a Deposition from the Cross (522), and a bacchanalian scene (573), both good examples of his free and facile manner. No. 535 is an interesting study in his early manner for the frescoes at Siena that were painted by Pinturicchio from his designs.

On the other side are some fine Albert Dürers. Nos. 583, 589, and 599 are life-sized heads, the latter especially good. No. 601, "Design for a Tomb," shows his free yet careful execution at its best. No. 600 is rather puzzling; it is a copy with variations of a well-known engraving. It was never the artist's practice to make such elaborate pen-and-ink studies for his engravings; at the same time the workmanship is so wonderful that it is difficult to assign it to any one but the master himself. We must call attention to a marvellous head by John Van Eyck (629), and then pass on to the room which is devoted to the works of M. Ingres.

There has been so much controversy as to the merits of this artist, that it may be as well to devote a little space to a critical examination of them. By his admirers (amongst whom there are artists and art critics of all schools) he is called the finest draughtsman since Raffaelle, with whom he is supposed to have a remarkable affinity. His detractors assert that, not only he cannot paint (which is undeniable), but also that he cannot draw; that his figures are mostly out of proportion, and always feeble; that his compositions are poor and conventional; and that his success lay, not in striving after the ideal beauty of Raffaelle, but in painstaking realism in the portraiture of vulgar people. Now we will say at once that, in our opinion, his works at the Grosvenor Gallery go far to confirm the latter view. Let us take the large and ambitious composition called "The Apotheosis of Homer." Was anything more commonplace ever invented? Homer sits awkwardly in the middle of the picture, with numerous figures of ancient writers and artists standing in conventional attitudes on each side of him. On a lower level, and much too small to be consistent with perspective, the study of which Ingres always despised, stand more modern heroes, the grouping and attitude of whom seem to have depended chiefly on prints and portraits from which they are copied with almost slavish fidelity. The drawing is throughout feeble, all the illustrious Greeks and Romans being much too short in the leg. This peculiarity comes out well in the studies made for the separate figures, such as Nos. 662, 664, and 665, all of which dwindle curiously as they go downwards. That Ingres had no eye for proportion can be seen in most of his studies, notably in 635, where the hand is much too big; 633, where the forearm is too long; 643, which is wrong all through; and 652, which is as thoroughly bad a study of a female figure as one could see anywhere. What his feeling for grace of line and poetry of attribute was may be well seen in the picture of "The Odalisque" (696), which is neither more nor less than disgusting. On the other hand, when he confined himself to accurate and careful portraiture of the men and women around him, he reached a very remarkable degree of realism, though one may regret that so much care and pains was bestowed generally on such very unfortunate subjects; where he endeavours to idealize a portrait, as in No. 693, the result is merely ridiculous.

We can but mention the excellent collection of modern drawings which so worthily complete the historical retrospect of English water-colours which was begun last year. The collection appears to be truly representative, and shows a richness and variety which prove that, in some directions at least, a great stride has been made since the days of the founders of the art.

HAMLET AT THE LYCEUM.

PROBABLY never in the recent history of the English theatre has any event been so eagerly expected as the opening of the Lyceum Theatre under Mr. Irving's management, which took place on Monday last. It was known that the actor's object in taking upon himself the conduct of the theatre was not so much to display his own great powers as to do honour to his art by securing as near an approach as possible to the combined excellence and smoothness of the best Continental theatres. In the general arrangement and mounting of *Hamlet* much was expected from Mr. Irving's study of the poet, and his keen eye for picturesque effect. It was to be supposed that his fine taste would hit the right point between a mean or shabby illustration of the drama's action and an over-elaboration of gorgeous or so-called realistic scenery. It may be at once said that in none of these matters has expectation been disappointed. What was even more important and aroused a deeper excitement was the announcement that Miss Ellen Terry was to appear as Ophelia. We have often expressed our conviction, founded heretofore on what may have seemed insufficient grounds, that there is scarcely any character in the poetic drama beyond the reach of this actress; and her performance of Ophelia, which is to our thinking more difficult than many parts which are considered greater, has confirmed us in this belief and proved her to possess distinct genius.

Before going into detailed criticism of the acting of the play, it may be convenient to say something of the alterations and improvements made in the scenic arrangement, an account of which

is given in an interesting preface, signed "F. A. M.," to Mr. Irving's acting edition. "In Act I.," to quote from this, "the first scene has been so constructed as to allow of the ghost appearing to Marcellus, Bernardo, and Horatio on the battlements of the Castle, and not, as generally arranged, merely crossing over the front portion of the stage." It is shown by various passages in the dialogue that this scene is supposed to take place between midnight and the first approach of dawn, and accordingly this has been indicated by the painter, while "in the sky may be seen the star of which Bernardo speaks (line 35), 'When yond same star that's westward from the pole.'" In the last scene of this act an alteration from the usual plan of placing it in another part of the platform has been suggested by the lines, "What if it tempt you towards the flood, my lord, or to the dreadful summit of the cliff," &c., and by Hamlet's exclamation, "I'll go no further." Such a speech is certainly more natural in the circumstances shown in the present performance than it would be if the old direction, *another part of the platform*— supported, as the writer of the preface says, by no particular reason or authority— were followed. Besides, if it was only to another part of the platform that the Ghost led Hamlet, Horatio and Marcellus would hardly have had to spend much time or trouble in finding him. It is of course probable enough that not one of these considerations occupied Shakspeare when he wrote the play; but what is worth doing at all is worth doing well; and, as scenery is in these days universally preferred to the use of placards, it is well that it should be made to serve, as Mr. Irving makes it, its true purpose of illustrating, consistently and picturesquely, the action of the play. In former representations of *Hamlet* at the Lyceum the effect of this scene was undoubtedly marred to some extent by the unhappy arrangement which made the Ghost deliver his speech from a kind of pulpit in a tree, which had apparently been specially established for his use. As it is now managed, the battlements of the platform disappearing reveal a wild spot on a rock-bound shore. The Ghost is discovered standing in the moonlight on a commanding eminence of the rocks, through and down which he sinks when he is summoned back to his torments. In the last scene of Act III., represented, as usual, as an antechamber to the Queen's bedroom, the Ghost is made to enter, not in armour, but "in a kind of dressing robe (the *night gowne* of the stage direction in the first quarto)," which, though it is a comparatively small matter, we conceive to be a decided improvement. In the churchyard scene, "the church is supposed to be built on the hill above the royal palace, and the procession is seen coming slowly up the ascent just as evening is changing into night;" and the scene in which Osric appears is placed out of doors, instead of in a hall in the palace as has been customary. The reason of this change, on which the writer of the preface has some pertinent remarks, is to be found in Hamlet's request to Osric to put on his hat, and in what he says about the weather. Finally, the last scene shows a vestibule in the palace, with arches at the back of the stage, through which is seen the orchard, referred to by the Ghost. The grouping and arrangement of colour in this scene, about which there is a curiously pre-Raffaellite air, are admirable. In the text of the play Mr. Irving has indulged in what seems to us a needless love of emendation in various slight alterations, for all of which some authority is to be found. An instance of this is to be found in Act I. sc. 2, where "whilst they *bestil'd* almost to jelly with the act of fear" is given instead of *distilled*. The more usual reading is as graphic and natural as a thing can well be, and the alteration appears to us to be singularly far from being wise or advisable. The association of a jelly—a tremulous substance—with the act of fear is perfectly easy; not so its conjunction with the word *bestil'd*. To bestil is, according to Richardson, "to tranquillize, to calm"; and to bestil to a jelly is to tranquillize to shakiness, which is plainly absurd. Again, in Act II. scene 2, Mr. Irving reads "For if the sun breed maggots in a dead dog, being a *good* kissing carrion," for *god*, which we like no better than the previous alteration. We had a strong impression, which we are glad to find is not borne out by the published edition, that in the last act Mr. Irving, in the line "The cat will mew, the dog will have his day," changed *day* to *bay*— an alteration about as valuable as that of "The child is father to the man" to "The man is father to the child." One other point, which is not new, strikes us as not completely satisfactory. In Mr. Irving's version Hamlet's speech to the King before he kills him runs thus:—

> Here, thou incestuous murderous damned Dane,
> Drink off this potion.
> Follow my mother. (*Stabs the King.*)

In the original text Hamlet stabs the King at the words, "Then venom to thy work," and after the King has exclaimed, "O, yet defend me, friends, I am but hurt," come the lines, "Drink off this potion, is thy union here? Follow my mother." Some actors have illustrated this line by the somewhat clumsy process of forcing the contents of the poisoned goblet down the King's throat, as if he were an animal being dosed. There can be no reasonable objection to Mr. Irving's being content, for stage purposes, with killing his enemy once; but we may, we think, fairly object to his retaining the words, "drink off this potion," which, according to his arrangement, are either superfluous, or must bear a meaning that hardly belongs to them. As to the actor's view of the passage in the scene with Gertrude, "Look here upon this picture and on this," &c., that is, it appears to us, a matter upon which every one must judge for himself according to his taste and feeling.

In criticizing such a performance as that of last Monday it is generally fair to remember its exceptional nature, and the nervousness probably experienced by the people upon whom the chief share of the work falls, however great may be the encouragement given to them. Certainly no actor or manager could wish for a more enthusiastic welcome than that which was given to Mr. Irving; and the only point in his performance for which it was necessary to find any excuse was a tendency to too great slowness in the earlier scenes. In the Ghost scene, in which he has restored the "wild and whirling words" concerning the "old mole" and the "fellow in the cellarage," the actor appeared to us to catch more nearly than he has ever done before, in spite of this slowness, the reaction of wild excitement which possesses Hamlet; but we still find him too lachrymose, too little carried away by an unnatural mirth. From this point onwards Mr. Irving's performance seemed to improve. Throughout the rest of the play he rendered, with even greater force and fineness than before, by turns the bitter irony, the rage, the abandonment to grief, and the lighter moods of the Prince. In the scene at the grave his acting seemed to have assumed more meaning and to be more perfectly under just control; and, as on former occasions, in the dialogue with Horatio just after Osric's exit, he conveyed in a few words a whole history of tragedy. In the scene with Ophelia Mr. Irving's acting has always been marked by strikingly poetical perception and delicate execution. On Monday last he reached in this a height of passion and tenderness which before he has scarcely approached. Something of this effect may no doubt be due to the fresh inspiration derived from the singularly beautiful acting of Miss Ellen Terry.

Throughout *Hamlet* Miss Terry's Ophelia is the essence of grace, simplicity, and tenderness. There is a remarkable charm about her acting of the lighter passages in the early scenes, and her mad scene was exquisite in its thought, its power, its complete unconventionality and its natural pathos. A striking instance of her hold over her audience was found in the deep impression produced by her delivery of the words, "To have seen what I have seen, see what I see." Miss Ellen Terry's performance is one that dwells upon and haunts the memory.

Mr. F. Cooper appears as Laertes. He speaks and moves well, and at times his acting has real merit; at others it seemed ineffective; but, as has been said, we are now speaking of a representation in which probably every one had more or less nervousness to contend with. Mr. Cooper fenced extremely well in the last scene, as, in a less practised method, did Mr. Irving. The exchange of foils was managed probably as well as so strange an affair can be managed. The movements just before it might perhaps be improved. As far as we could see they consisted of rapid thrusts and parries in *seconde*, a guard sparingly used by experienced fencers. It was probably by inadvertence that Mr. Irving wore his hat during the salute and the first part of the assault. Mr. Mead and Mr. Chippendale retain and played excellently their old parts of the Ghost and Polonius. Mr. Swinbourne appeared as Horatio, and Mr. Forrester gave to Mr. Swinbourne's old part of the King a plausible air which it too often wants. Miss Pauncefort seems to us to have improved her performance of Gertrude. The grave-diggers were played with commendably quiet humour by Mr. Johnson and Mr. Andrews; and the minor characters, notably that of Osric, by Mr. Hellew, and the small but important part of Marcellus, by Mr. Gibson, were well filled. The new manager may be warmly congratulated on the success in every direction of his first production. If we might venture on a suggestion, it would be that, having done so much for the drama, he should take one more step forward, and refuse to subject himself to the fatigue of playing such a part as Hamlet every night in the week.

REVIEWS.

BAGEHOT'S LITERARY STUDIES.*

MR. BAGEHOT'S critical Essays are well worth preserving. Mr. Hutton in his graceful and instructive Prefatory Notice expresses a kind of regretful irritation at the praise which had been deservedly, but too exclusively, bestowed on his friend's political and economical writings. Nothing could be more natural than the selection by eulogistic critics of the qualities for which Mr. Bagehot was most generally known; but Mr. Hutton's feeling will be understood by those who have mourned over the premature extinction of intellectual gifts which were only appreciated by a few. That the Editor of the *Economist* discharged with great ability an important public function was known to many who had no means of appreciating the varied gifts which Mr. Hutton lovingly enumerates. Mr. Bagehot's literary criticisms in some degree justify the assertion that in his "buoyant, subtle, and speculative nature the imaginative qualities were even more remarkable than the judgment." His reputation for "the gay and dashing humour which was the life of every conversation in which he joined" must rest on the testimony of his friend. The boldness, approaching to paradox, of some of his literary judgments renders it probable that he was, as Mr. Hutton says, lively

* *Literary Studies.* By the late Walter Bagehot. With a Prefatory Notice, edited by Richard Holt Hutton. London: Longmans & Co. 1879.

and humorous in conversation. In ordinary society he appeared exempt from the desire to startle or surprise, and indeed from every form of eccentricity. He may probably have reserved his gayer moods and his more subtle play of thought for a narrower circle. One characteristic attributed to him by Mr. Hutton was a deliberate sympathy with what he called stupidity, which was, in truth, commonplace opinion. No competent observer of social and political life will underrate the power and the probable soundness of common judgment and established custom; but habitual tolerance of prejudice, and even of dulness, is easier when it is accompanied by a feeling of amusement. A greater humourist than Mr. Bagehot considers it an admirable quality in the English nature that it yields slowly or not at all to logical demonstration. Mr. Carlyle even found something to admire in the pertinacity with which men believed in the Corn-laws after they had been conclusively proved to be foolish and mischievous. When nothing more could be said in their defence, people still doubted whether there might not be something on that side which could not be said. Mr. Bagehot founded a political theory on a predilection for popular tenacity. In some letters on the *Coup d'état* of 1851 which caused some scandal to his Liberal friends, Mr. Bagehot maintained that the French were too clever for freedom. On maturer experience he modified his admiration of the Bonapartist system, though he still regarded the Empire as the best Government for material purposes which the French had yet enjoyed. It is not known whether he would have shared the admiring confidence which the French Republic now excites in England. If he had believed that the experiment would ultimately succeed he might perhaps have reconciled the fact with his own principle by reference to the obstinacy, ignorance, and indifference to freedom of the rural population which has now become a principal power in the State. In time, perhaps, the French may acquire the wholesome English instinct of taking things for granted and letting well alone.

It would seem that Mr. Bagehot himself was, notwithstanding his party associations, inclined to be a Conservative of the utilitarian and sceptical type. It is to be regretted that, by a curious inconsistency, he ran counter to history and to the national character by renouncing all the Imperial traditions and associations of England. He would, if he could, both have abandoned India and the colonies, and have accepted for his country the position of a fourth- or fifth-rate European Power. It would be unreasonable, except as far as the doctrine seems to involve personal inconsistency, to discuss a heresy which is not shared by his present editor. It was not in general Mr. Bagehot's habit to struggle against the unforeseen results of natural causes. If India or the colonies had been acquired in pursuance of a theory, the proof that they were pecuniarily unprofitable might suggest a doubt of the expediency of creating an Empire. Mr. Bagehot might have been expected to infer, from the long-continued and triumphant exertion of past energies, the disadvantage of depriving them of their accustomed field. In modern times the government of the colonies requires good sense and good temper in dealing with practically independent communities rather than courage or genius; but the responsibility of keeping and ruling India is in itself a liberal education to Englishmen. An interesting biographical notice of Mr. James Wilson by his son-in-law and successor explains the principle on which both conducted the *Economist*. In knowledge of the details of commercial business Mr. Wilson was probably superior, though as a banker Mr. Bagehot had, like the founder of the journal, the advantage of practical experience of trade. His wider intellectual sympathies never diverted him from the consideration of financial and economical expediency. In his time the principles of political economy had almost ceased to be subjects of controversy, though the practice of taxation and currency still requires all the care and knowledge of statesmen and their skilled advisers. According to his biographer, Mr. Bagehot attached only secondary importance to the reduction of public expenditure. On his economical policy in general it is not Mr. Hutton's present purpose to dwell. He only touches in passing on a fundamental difference of political opinion or temper between himself and his friend. Mr. Bagehot held, in common with the great majority of his educated contemporaries, that government ought to be in the hands of the refined and cultivated classes. Mr. Hutton reserves his own well-known preference for a democracy which will, as he thinks, most adequately consult the interests of the bulk of the population. No mention is made in the Prefatory Notice of the excellent work on the English Constitution which will probably be better remembered than any other of Mr. Bagehot's writings. The imaginative power which is ascribed to him by Mr. Hutton is exemplified in his faculty of distinguishing the real forces of government from constitutional fictions. Imagination, indeed, may be defined to be the faculty of seeing things as they are. The history and theory of English institutions may be conveniently studied in Blackstone. Mr. Bagehot performed the further service of explaining the actual results of a complicated series of causes.

Nearly all the critical Essays which are now republished have the advantage of interesting subjects. Mr. Bagehot had something original to say on Shelley, on Cowper, on Scott, on Milton, and even on Shakspeare. No writer has more clearly apprehended Shelley's incapacity to create or understand a complicated character. As he happily observes, the extravagant wickedness of Cenci is conceived in the spirit of a child who thinks that anybody who is bad is very bad. It is also true, as Mr. Bagehot says, that Cenci belonged to a class which was always hateful to Shelley. "In most of Shelley's poems—he died under thirty—there is an extreme suspicion of aged persons. In actual life he had plainly encountered many old gentlemen who had no belief in the complete and philosophic reformation of mankind." It was perhaps from his excessive dislike of his own father that Shelley formed his generalization of the odiousness of age; but, even when he was less deeply prejudiced, he had no power of representing human nature. Mr. Bagehot acutely remarks that, while the unearthly beings of other poets are generally failures, "in Shelley such singing solitary beings are almost uniformly successful; while writing, his mind really for the moment was in the state in which theirs is supposed always to be. He loved attenuated ideas and abstracted excitement. In expressing their nature he had but to set free his own." Mr. Bagehot agrees with other capable critics in recognizing the perfection of Shelley's style. He has not left any special notice of Wordsworth, whom he preferred to all modern English poets. Like other admirers of Wordsworth, of Shelley, and of Keats, he would probably have relegated Byron to the second rank of poets. In his review of the *Waverley Novels*, Mr. Bagehot cordially appreciates, not only the creative genius, but the manly cheerfulness and the penetrating sagacity of Scott. No better vindication has been written of the admirable romance of *Ivanhoe* against the one-sided criticisms of antiquaries. It is undoubtedly true that no such characters or events could have been found either in the reign of Richard I. or at any other historical period; and it also must be admitted that Scott borrowed without inquiry from Thierry a false conception of the relation between the descendants of the Norman conquerors and the general English population. Yet, as Mr. Bagehot says, Scott has produced a picture of the ideal middle age which would only have been spoiled by minuter accuracy. The compositions of the great Italian painters diverge as widely from the scenes which they profess to reproduce; but their successors of the present day have not advanced religious art by copying the features of Jewish beggars or Arab vagabonds, or even by studying the geologic formation of Mount Sinai. Mr. Bagehot more than once recognizes the value, not of Scott's abstract opinions on political economy, but of the materials which he supplies for economic investigation. No critic was better qualified than Mr. Bagehot to appreciate the admirable and instructive narrative of the innovations by which the Laird of Ellangowan lost his popularity and embarrassed his fortune. It is the highest praise of Scott that he alone among English writers may at a distance be said to resemble Shakspeare. The same vigorous and joyous temperament enabled both to enter heartily into the life of imaginary characters. After quoting from *Venus and Adonis* a minute description of the windings of a hunted hare, Mr. Bagehot says that of Shakspeare we at least know this, that he had seen hares hunted with keen perception of the nature of the sport. The music of the cry of hounds is also described with sympathetic interest in the *Midsummer Night's Dream*, and in the prologue to the *Taming of a Shrew;* but some careful student has rightly observed that the affection of dogs for man is the only familiar relation which Shakspeare has nowhere recorded. The Essay on Shakspeare may be read with profit and pleasure after a thousand lucubrations on the same inexhaustible topic. Mr. Bagehot's criticism on Milton contains the result of intellectual conviction rather than of simple enthusiasm. With the harsh austerity of Milton's character he had evidently little sympathy; and he denounces with just severity the preposterous fiction on which the plot of *Paradise Lost* is ostensibly founded. Such a story was scarcely a performance of the undertaking "to justify the ways of God to man"; but, like a poet even greater than himself, Milton redeemed by consummate execution the faults of a vicious plan. The *Paradise Lost* is much less monstrous than Dante's Hell and Purgatory and Paradise, and it almost equally defies all but fragmentary criticism.

Essays on Gibbon and on Bishop Butler, written between twenty and thirty, display in some passages a levity which, if not consistent with perfect taste, may easily be pardoned in a young writer. At a maturer age Mr. Bagehot would have dwelt less on the foibles of Gibbon and attached greater importance to the conscientious accuracy which has astonished all his followers in the obscure region of Byzantine history. The metaphysical acuteness of the argument against Butler's famous doctrine perhaps belongs to youth. The zeal and freshness which inspire philosophic subtlety naturally precede full and tolerant knowledge of human life. Mr. Bagehot's reviews of Macaulay and Dickens are more valuable than his earlier criticisms. In both instances he had the courage to point out in the height of their popularity some defects which are now generally acknowledged. No writer has denounced with stronger or more merited contempt the absurd pretension of Dickens to the character of a social and political reformer. Mr. Bagehot also felt an extreme distaste for the coarse and histrionic pathos to which Dickens owed the vulgar popularity of his worst and latest works. An essay on Sterne does more justice to one of the first of humourists than the carping criticism of Thackeray; but Mr. Bagehot himself scarcely appreciated Sterne's astonishing power of creating living characters. For Thackeray himself Mr. Bagehot entertained a warm admiration which was not incompatible with a perception of the elements of weakness which belonged alike to his genius and his character. Criticisms on critical books are open to the

objection which in former legal procedure forbade a demurrer on a demurrer. It is more desirable to call attention to the literary remains of a man of extraordinary ability than to inquire whether his judgments were uniformly correct.

GORE'S ART OF SCIENTIFIC DISCOVERY.*

THAT an art of scientific discovery exists may be taken as sufficiently proved by the fact that discoveries in science are made, and those who make them do not work at random. The real question is whether, by what means, and to what extent, this art can be taught; εἰ διδακτὸν ἡ ἀρετὴ in this special class of applications. While philosophers were discussing theories of method, the common sense of mankind has long ago settled that the only sure way to learn an art practically is to work under the masters of it. In this way schools and traditions of every craft have been established, quite irrespectively of the capacity of those who practise it for giving a systematic account of their procedure. When they do try to give one, it is mostly inadequate, and to outsiders often unintelligible. To begin with an example from an art both homely and necessary, but admitting of much refinement; who could ever learn to make an omelette from any of the numberless cookery-books that have been written? The only way to improve the dulness and wastefulness of English cooks is, as Mr. Buckmaster and others have justly seen, to teach by example and found a practical tradition. Again, every parish in England was a school of archery till the musket finally prevailed over the long-bow. The art is not very difficult in its elements, but there are many niceties about it. The descriptions and precepts which have come down to us in Ascham's *Toxophilus* and other works are, however, imperfect on many points and perplexing on some; and we really have no distinct knowledge of the power or accuracy of our ancient national weapon in its best days. It is familiar to classical scholars how the souls of commentators have been vexed by the technical passages of Greek and Latin authors in which building, engineering, and the like matters are discussed; and this although the places in question may profess to give full and minute descriptions. When we come to the fine arts proper, it is still more evident how imperfect are the best efforts of language to render their methods. The mechanical operations of painting or sculpture can be prescribed, warning can be given against obvious faults, and certain necessary conditions of success can be enumerated. But no one has ever been able to determine what conditions are sufficient for the production of an excellent work of art; and, even as to those which appear necessary, it is every now and then found that genius triumphs over rules and defeats all expectation. And it is in the fine arts, perhaps, that we most clearly perceive the advantages of the continuous teaching by actual work and example which forms, as we say, a school. The disadvantages of its absence have been too long and too much exhibited in our own country; and it is certainly not by the speculative study of æsthetics that we shall repair them. The most consummate masters of art who ever lived would have been unable to lay down anything like a complete theory on the subject. We are apt to forget that language is only one instrument of human thought and action, and by no means the most delicate. Man can do, feel, and perceive many things which his words are inadequate to measure. This is true of the use of language itself, considered as a special art. Such an art has been deliberately cultivated in various ways in ancient and modern systems of education. Rhetoric, whose name is now almost a term of disparagement, was once esteemed an indispensable branch of learning. Here, again, grammatical errors and obvious blemishes of composition may be corrected; and assiduous criticism working under favourable conditions may even produce, as in modern France, a national school of style. But the charm of good writing is something that defies analysis; it cannot be prescribed by rule; it is more subtle than any measurable balance of clauses or harmony of cadences; it is a power felt but imponderable.

Now the process of scientific discovery is peculiar in the range and diversity of its operations. It is both mechanical and artistic. It demands the strenuous industry of the handicraftsman for its foundations, the most delicate skill of manipulation for its critical moments, and something of a poet's genius for its consummation. No great discovery was ever made without a great exercise of imaginative understanding. The constructive effort that goes to frame scientific conceptions may be partially measured by the effort which the learner must put forth to grasp them, even when they are fully explained and illustrated. Some of the great advances, and those in the exact sciences, have been made in a kind of obscurity which the discoverers themselves did not remove. Results have been proclaimed and accepted long before formal proof of them was given; and posterity has been left to verify the methods used, or even to supply whole demonstrations. This being the nature of the art, is it to be expected that its methods should be more plain and more easily reducible to set terms than those of any common handicraft? Surely not. One may describe, just as in other arts, up to a certain point. But there remain the indescribable elements, the judgment in choice of means, the trained insight, and the tact of experience, which can be found only in the practice itself. And this essentially practical side of the art, being in a general way important in proportion to the complexity of the matter in hand, is in the case of scientific discovery, at least in its higher regions, of an importance hardly estimable.

It is a curious and interesting question how the contrary impression ever came to prevail. We suspect that it was in great measure due to the formality and apparent exactness of the mental discipline to which the generations immediately preceding the revival of science had been submitted. The scholastic logic provided an elaborate system of rules for the comparison and combination of statements, which, although modern logicians have shown it to be by no means complete, was exact as far as it went. It is now not difficult for us to perceive that the rules of the syllogism are infallible simply because they are concerned not with things but with names. But this was not perceived by mediæval students, nor was it possible that it should be. In things spiritual and temporal alike men's minds were wholly possessed by the dream of absolute knowledge. And when they awoke to see new fields of inquiry opening before them, the spirit of their dream still followed them. Knowing that in logic and mathematics they had certain artificial methods which led them with certainty to the desired results, they assumed that there must be such a method also in natural science; that, were it once found, the secrets of nature would be rapidly and easily mastered; and that the search for it was the great preliminary task of all scientific inquiry. Bacon is the most familiar representative of this mode of thought; and, in consequence of the strength and spread of it in his time being overlooked, he has been much misapprehended both for praise and for blame. He has been praised as if he had been the sole and first inventor of modern natural philosophy, and blamed as a pretender who, on the strength of rhetoric and confused learning, set up for having an infallible method such as nobody had ever heard of, and has deceived many even to this day. But the notion of an infallible scientific method was none of Bacon's inventing. It was already in the air; people had been brought up in an atmosphere of infallibility and beaten roads to certainty, and they had yet to learn by long experience that every man must make his own road for himself. What is yet more curious is that the expectation lingered on long after Bacon's generation, and after it was evident that his method had been powerless in his own hands. Men did not conclude that the great secret was a chimera, but that it remained to be found. Descartes believed in an infallible scientific method; so did Spinoza, though we do not fully possess his mind on that subject; so did the later Cartesians, of whom one of the most brilliant, Walter von Tschirnhausen, had his ardour mildly rebuked by the warier Huygens. And in the very same breath Huygens, while pointing out the delays and difficulties incidental to experimental research, mentions Bacon's method with considerable respect. After these, again, Leibnitz cherished the conception of a sort of philosophical calculus by which morals and metaphysics could be settled on a footing of demonstrative certainty within a couple of years, and the remaining sciences completed in the same manner in no long time.

It must not be supposed that the ambition of Bacon or Descartes was confined to giving an analysis of the operations of inductive reasoning. They expected to lay down working rules by which great discoveries might certainly be reached in a moderate time, if only experiments were undertaken on a sufficient scale. Descartes commits himself to the opinion that the whole system of natural philosophy might thus be completed in a generation or two. This was partly due to the actual complexity of the problems of science being enormously underrated, as may be well seen in the *Principia Philosophiæ* of Descartes. But it cannot be fully explained without taking into account some such more subtle causes as we have ventured to assign. The world appeared as a vast collection of tangible and visible premisses already to hand, and whoever could hit upon the right scheme of moods and figures would be able to work out any number of conclusions. A real art of discovery was a thing earnestly believed in for a century at least.

Modern writers have expressly or tacitly renounced attempts of this kind. The general theory of Proof given by J. S. Mill is not an art of discovery, but a scientific account of the processes employed in the art, for the most part without reflection. It applies quite as much to judicial evidence as to any other branch of inquiry for truth, and has been used for the special purposes of the theory of evidence by Sir James Stephen. And, conversely, it is not much more likely to give any direct practical guidance in discovering a new element than in cross-examining a witness. It shows the logical bearings of observed agreements and differences, but it does not and cannot show how vital resemblances may be detected underlying apparent discord; how the mind's eye may seize the tokens of wide-reaching uniformity in the seeming confusion of particulars. Methods of proof may serve to test ideas, but they cannot create them. But if scientific genius did not bring forth ideas, there would be nothing but disjointed facts to work upon. You cannot even collect facts to any purpose without an idea to guide you. The truth is that in all but the simplest inquiries the preliminary task is to make sure of your materials, and also to bestow your labour on getting the right materials. This is often the hardest part of the business; and here there is no master-key but the tact and resources of trained common sense. But one of the ways in which common sense is trained to deal with a special class of problems is the exhibition of the methods by which problems of the same or an allied class have already been successfully attacked. Therefore writers of eminence,

* *The Art of Scientific Discovery; or, the General Conditions and Methods of Research in Physics and Chemistry.* By G. Gore, LL.D. F.R.S. London: Longmans & Co. 1878.

as Dr. Whewell, Professor Jevons, and the various authors who have treated science historically, have given systematic accounts of the means and processes actually employed by scientific workers in their different branches. It is unquestionable that such accounts, if brought together with judgment and accuracy, may be of the greatest use; and it appears to us that they are the best and the only possible literature of the art of discovery.

We should be glad to welcome Mr. Gore's book, if we could, as a satisfactory addition to the number of such works. But we cannot honestly do so. It has very good intentions, but fails in literary power and arrangement. The result is a mixture of anecdotes about particular scientific discoveries and discoverers, often interesting enough in themselves, with generalities about scientific truth and the conditions of inquiry too often verging on platitude. There are too many quotations from other books, and not enough expenditure of work on organizing the miscellaneous mass of facts. Much useful matter is to be found up and down the volume, and there are doubtless parts of it which students of the natural sciences, especially chemistry, might read with advantage. But we must here take the book as a whole; and, so taking it, we are unable to pronounce it a successful piece of literature.

SOME RECENT POETS.*

THERE was once silence in heaven for the space of half an hour, and there has been a quiet even more prolonged in the garden of the Muses. Several months have passed since M. Victor Hugo published an epic, or Mr. Browning "a poem in verse," to adopt the language of an indiscreet announcement. Between the songs of the nightingale and the lark there is often in summer such an interval of silence, broken only by the occasional pipe of the early blackbird, or, in America, by the familiar bobolink. The works of the poets whose verse we now propose to examine may be compared, in volume at least, to the music of the less lusty-voiced fowls of the air. M. Joseph Boulmier's *Villanelles*, for example, are easily contained in a beautifully printed little book of one hundred and forty pages. Miss Robinson's *Handful of Honeysuckles* has but eighty-eight pages; and the æsthetic Vampire who is the heroine of Mr. Payne's *Lautrec* manages in fifty-nine pages to display all her store of unusual experiences. Without introducing that "invidious distinction" between major and minor poets which the undergraduate refused to draw in the case of the prophets, it must be admitted that our three authors present themselves modestly, and do not seem to ask for very extensive comment.

M. Boulmier's *Villanelles* make as charming a little casket full of enamelled ornaments in the style of the Renaissance as the amateur of jewelry in words can desire to possess. The writer is a perfect master of the peculiar form of verse into which he chooses to fix moods of gaiety, melancholy, pity, and enjoyment. He knows exactly what he intends to do, and he intends to make no very deep or solemn impression. His are the tempered sentiments which writers like Praed and like Thackeray in his verse never permit to grow up or to degenerate into passions. The author of courtly verse has equally to avoid earnestness and flippancy. His pleasure and pain, unlike those of the severer poets, must be the pleasure and pain of a man who takes Montaigne's advice and "makes no great marvel of his own fortunes." Poetry which submits to these limitations has a distinct place of its own, and a province in which M. Boulmier is a master. He preludes to his verse by a treatise in prose on that form of verse which the French call the *villanelle*. Unlike the *ballade* and the *rondeau*, the *villanelle* had originally no strict rules. To be somewhat gay, with a rustic or pastoral mirth, and to possess a refrain, were all the qualities needed to make a short piece of verse a *villanelle*. Thus most collections of French lyrics contain the poem of Philippe Desportes:—

> Nous verrons, volage bergère,
> Qui premier s'en repentira.

That poem was a *villanelle* before modern writers introduced the stricter rules of the game. Just as the rules of epic composition were deduced from the Iliad and Odyssey, so M. Boulmier has restricted his *villanelles* to the form used by Passerat (1534–1602) in the line "J'ay perdu ma tourterelle." This *villanelle* is composed of five "tercets," followed by a "quatrain," or nineteen lines in all, of which seven are the mere repetition of the two refrains. M. Boulmier thinks that nineteen lines of this kind of thing are quite enough at a time, and English readers will agree with him. According to ordinary French practice, a *villanelle* "may stretch from here to Mesopotamy," or, at least, may go on as long as the villanellist can find rhymes. So much for the form of the *villanelle*, which will be illustrated by M. Boulmier's own examples. As for the topics and style, the poet must speak for himself:—

> En fait de style, ce qu'il faut avant tout à la villanelle, c'est du tendre et du naïf. Les souvenirs aimés, les mirages du cœur, les divins enfantillages de l'amour, voilà son meilleur domaine. . . . Mais ce qu'elle abhorre, et à juste titre—en raison de son origine paysanne—c'est l'emphase, la sonorité banale, la mièvrerie prétentieuse, la jonglerie des mots.

Here, then, is an example of a *villanelle* engaged with *les souvenirs aimés*:—

Primavera.

> Elle avait quinze ans à peine,
> J'en avais dix-huit au plus;
> Souvenir, qui te ramène?
>
> Combien de fois dans la plaine
> Nos pas se sont-ils perdus!
> Elle avait quinze ans à peine.
>
> Nous poursuivions, hors d'haleine,
> Les papillons éperdus;
> Souvenir, qui te ramène?
>
> Puis, un jour, sous le vieux chêne
> Nos cœurs se sont entendus;
> Elle avait quinze ans à peine.
>
> Bref, on la fit châtelaine,
> Et loin d'elle je vécus;
> Souvenir, qui te ramène?
>
> C'est une histoire lointaine,
> Tous regrets sont superflus.
> Elle avait quinze ans à peine,
> Souvenir, qui te ramène?

Does not this melancholy little lyric remember its dancing-days—the old days when all these peasant measures were sung as the music of the dances? The refrains cross, and take hands, and cross again; the poem is like a disappointed little rustic beauty at a fair, tearful and half-consoled. *Le Quatorze Mai* is in the same style, but sadder. The poet writes almost as much about his cats, Gaspard and Coquette, as about his memories. Coquette and Gaspard inhabit his rooms and make them less lonely, till poor Gaspard dies. "Il n'est plus, mon vieux Gaspard," and Coquette easily consoles herself. The whole philosophy of the moody bachelor is summed up in the poem "Je tisonne." But perhaps what one likes best in M. Boulmier's book is his extremely frank epilogue:—

> Soyons franc, à bas la frime!
> Ce n'est pas pour toi, lecteur,
> C'est pour moi que l'on m'imprime.

For others as well as for himself, they have printed M. Boulmier very prettily, with neat rubrics, on paper which is "a separate ecstasy." If all the world took to writing *villanelles*, life would be made hideous; but there is room surely for those of a reforming poet who has docked the endless amplitude which some of his predecessors permitted to these exercises.

Miss Robinson, with her *Handful of Honeysuckles*, has been kept waiting too long. The critic might easily find fault with this bouquet. He might say that some of the flowers have a false old-fashioned air, and, to be done with this botanical metaphor, might hint that when a lady introduces Greek names into verse she should be careful of her quantities. These things are of very little importance; to avoid them the author only needs a little of M. Boulmier's determination to be honest, and to be himself, "et je dis 'zut' à la phrase." Turning from faults of manner to real merits, the reader will find in Miss Robinson's book signs of an unusual command of metrical language, much sense of the music of words, a power of making a scene visible, with plenty of colour and light on it. Here, for example, is the verse which describes the arrival of Constance (who has set forth in a little boat to find her lost lover alive or dead) on the coast of Barbary, where of course her Martuccio welcomed her:—

> First, a thick cloak of faded red,
> Then a light dress of laurel-green,
> Then a belov'd brown rippled head,
> With sleep-flushed face the curls between,
> "Constance," he cried, "Constance awake!
> How came you hither—for my sake?
> Or has our year-long parting never been?"

Here, again, is a little pastoral which is very freshly and daintily conceived:

A Dialogue.

> SHE. The dandelions in the grass
> Are blown to fairies' clocks,
> On this green bank I pluckt (alas!)
> The last of lady-smocks,
> HE. Let them die,
> What care I?
> Roses come when field flowers pass.
>
> SHE. But these sun-sated, sultry hours
> Will make your roses fall,
> Their large, wide-open, crimson flowers
> Must die like daisies small.
> HE. Sweet as yet!
> I'll forget
> (When they die) they lived at all!

Is there not, too, an accent, a memory of the musical age of Elizabeth, here:—

> What can heal a broken heart?
> Death alone I fear me,
> Thou that dost true lovers part,
> What can heal a broken heart?
> Death alone that made the smart,
> Death that will not hear me.
> What can heal a broken heart?
> Death alone I fear me.

Miss Robinson's talent is undeniable; her danger perhaps is that of artistic affectation which is often adopted out of mere humorousness for the fun of teasing the grave, but is apt to become habitual.

It is not agreeable to a reviewer to have to confess himself puzzled. *Lautrec*, however, by Mr. Payne, is very puzzling. Is

* *Villanelles.* Par Joseph Boulmier. Paris: Liseux. 1878.

A Handful of Honeysuckles. By A. Mary F. Robinson. London: C. Kegan Paul & Co. 1878.

Lautrec. A Poem. By John Payne. London: Pickering & Co. 1878.

it a daring skit, in the style of *Firmilian*, on the poetry of graves and ghouls, or is it a serious effort? By dedicating his lines "au noble poète Leconte de Lisle" Mr. Payne seems to hint that he is not joking. No poet is less humorous than M. de Lisle. The author of *Lautrec* prepares us for what is coming by a brief natural history of the common vampire, which "fearsomely feeds on the blood of sleeping folk." He then introduces us to a grave in which a lady vampire is waiting for the moon to rise and set her free to go and feed fearsomely. Meanwhile she is talking to herself, for want of company:—

> The moon comes strangely late to-night,
> And yet meseems the dusk has laid
> On all its woven hands of shade;
> Spent is the tall wan altar-light,
> And the last vesper prayer is pray'd.

The vampire's talk is all in this style. Occasionally she uses old-fashioned terms like "meseems," "upleapt," "treen," "dreariment," and anon she quoth "the thaumaturgic splendour shone," which sounds a little more modern. Though naturally impatient, she feels that her holiday in coming:—

> The signs begin to thicken fast,
> A noise of horns, as if there blew
> The clarions of all storms that brew
> Within the world-womb for the blast
> That bids the earth and sea renew.

Renew what? asks the reader, and marvels how the storms, as they brew in the womb, dispose of their clarions. Meanwhile "unto the hush I cry aloud, in tones that only sprights can hear." Thank heaven for that; it would be dreadful if people who are not sprights could hear our heroine cry aloud. To divert her leisure the vampire now tells herself the story of her first love for "a simple knight," named Lautrec:—

> the fire did pass
> Of mutual love betwixt us twain;
> Then with a sob of fear and bliss,
> My senses failed me, and (ywis) (*sic*)
> I knew no more, until again
> He roused me with a burning kiss.

"The splendid passion of his kiss," as the vampire calls it, never left her, but all men bent "their way towards the Orient," and Lautrec too rode off to bring the Turk to reason. He was "a slave or slain," and the heroine, after a long interval of dreamy disease, was laid on her bier. The moonlight fell on her, and "a passion of strange hunger burned within her entrails." Her heart also "did burn and bleed with longings tiger-like." She yearned, in short, "upon some fearful thing to feed"; and had a fearful vision, from which, and from her catalepsy, she wakened to find Lautrec standing by her. They were married. And on their wedding night it occurred to the heroine to kiss a scar on his throat. As Mr. Macdonald says in *Phantastes*:—

> Alas! how easily things go wrong,
> A sigh too deep or a kiss too long.

This was a kiss much too long. Immediately the stress

> Of that hell's hunger I had known

seized the lady. She kissed Lautrec's scar, and

> So fiercely delved, that, like a wave,
> The bright blood spouted fast and far.

After this adventure she became a vampire:—

> At dugs of death my soul was weaned,
> Under the magic midnight star.

The poem ends with the rising of the moon, when the vampire starts on her usual professional stroll. There are many very eloquent passages in *Lautrec*, but neither the language nor the choice of subject seems to us to deserve high praise. This, however, is of course a question of taste. Our own has led us to form a rather strong opinion about *Lautrec*.

SIX MONTHS IN ASCENSION.*

IN the summer of 1877 Mr. Gill undertook an expedition to Ascension by the aid of the Royal Astronomical Society, to avail himself of an unusually favourable opportunity of observing "the opposition of Mars." He was accompanied by his wife, to whom we are now indebted for a lively and most agreeable book about the island. Mr. Gill has prefaced her little volume with an exceedingly lucid and interesting introduction, giving a succinct account of the successive methods by which philosophers have arrived at calculations as to our distance from the sun. In the first of Mrs. Gill's chapters, scientific explanations likewise preponderate; but they are given so easily and pleasantly, and are so necessary to the intelligent comprehension of what is to follow, that we cannot recommend anybody to accept the alternative she offers them—namely, to pass them over, "and read about our six months in Ascension, without the reasons that took us there." Moreover, one of the most sensational incidents in the whole narrative of the search for the solar parallax is related in that opening chapter, and took place before they had started from London. A heliometer was indispensable. Setting considerations of cost aside, so delicate and complicated an instrument could not have been constructed after they had decided on undertaking the expedition; and it appears that there was only one instrument in England that was at once suitable and available. It belonged to Lord Lindsay, who very liberally placed it at Mr. Gill's disposal. Fortunately, it occurred to them to have it set up and tested in the room of the Astronomical Society in Burlington House. Fortunately, we say, for the trials literally broke down in an accident which must have proved irremediable had it taken place in Ascension. While Mr. Gill was anxiously superintending the final adjustment of the screw, it suddenly gave out, the heliometer toppled over, and the mass of several hundredweight came with a crash to the ground, tearing, twisting, and smashing the delicate rods and tubes. The astronomer stood paralysed over the pitiable wreck, and hardly dared to stoop for a closer inspection. Happily, however, as it turned out, the mischief was less serious than it had seemed to be. The flaw that had so nearly proved fatal was discovered; and several sets of opticians, working industriously in concert, repaired the damage in something less than a week.

Ascension was certainly worth describing by any intelligent unfortunate who happened to be stranded there; though it would hardly repay the most enthusiastic of explorers to make it the special object of a pleasure tour. In the first place the island is singularly difficult of access; and in the next there are extraordinary difficulties in supporting existence when you get there. None of the outward-bound steamers touch at it. You must take your passage to St. Helena, and wait there for a homeward steamer from the Cape. But, as a preliminary, you must obtain the permission of the Admiralty to land at all; for the island is under the command of a naval officer, precisely as if it were one of Her Majesty's ships. "Indeed in the *Naval Gazette* the population of Ascension will be found under the heading, 'Crew of the *Flora* Tender,' and service here does not mean half-pay to the naval officer, but counts for active service afloat." And when you have got your permission to land, and found a steamer to bring you into the offing, disembarkation is seldom easy to effect, and must very frequently be altogether impossible. It is only in certain conditions of the weather that the surf-boats can force the lines of "rollers" which break upon the shelving beach or dash against the perpendicular cliffs. And there is an excellent reason for the Admiralty authorities being chary of what the French call a *permis de séjour*, although it is a privilege which is by no means likely to be abused. For, having once obtained a footing on the island, you find it far from easy to get anything to eat, while fresh water for anything beyond bare necessities is an absolutely unattainable luxury. The population, which consists of some two hundred souls—seamen, marines, and Kroomen, many of them invalided from the West Coast of Africa—is strictly rationed. On that sultry and shadeless rock sweltering in the middle of the ocean, the allowance of water for all purposes was a single gallon a day. Apparently the unfortunate quadrupeds had to shift for their living among the clinker in the lava beds, so that the quality of the fresh beef and mutton left as much to be desired as the condition of the riding mules. "Not even a Rothschild could buy a juicy leg of mutton here, nor enjoy the luxury of a fresh salad with his cheese." But one delicacy was in comparative abundance. The turtle-breeding ponds of Ascension have long been famous. Men are told off to turn the female turtles when they come ashore to deposit their eggs on the beach, and it is a very remarkable circumstance that the males are never seen. The ponds are two great rocky basins, into which the sea is admitted by sluices; and they have long afforded every opportunity for studying the habits and longevity of the animals. The largest of them weigh from five to six hundredweight; they are never killed till they are tolerably bulky; and the heaviest of them are supposed to be one hundred years old.

The first sight of Ascension was eminently disenchanting; nor did it at all improve on more intimate acquaintance. Timber there may be said to be none; a solitary misshapen palm-tree was a sight of joy and wonder, and natural vegetation of any kind is only to be found in a few exceptionally favoured situations. In one or two places, and notably up on the Green Mountain—so called we should suppose on the *lucus a non lucendo* principle—the taste and industry of the settlers have formed a little oasis, where the visitor may revel in a yard or two of turf, within sight of some beds of cabbages and turnips. But it might have been supposed that that arid jumble of rock would have been singularly favourable to astronomical observation. If you had scorching days and an utter absence of shelter, at least one might have counted on cloudless nights. And so, in excellent spirits, Mr. Gill and his wife set up their observatory on the level concrete pavement behind their cottage, which was facetiously known as the croquet-lawn. But no sooner had a few preliminary observations been made than the heavens malignantly darkened. Nightly, after a gorgeous sunset, a tiny cloud would rise out of the sea and gradually spread itself over the azure canopy. For any gain that was likely to accrue to science, it seemed that Mr. Gill might as well have remained in England. But it occurred to them that, after all, the eclipse might be local; and there is an amusing and exciting account of a daring exploration undertaken by Mrs. Gill, under the escort of a gallant old corporal, to see whether they might not mend matters by shifting their quarters; the upshot being, that they decided on removing bodily with the heliometer and all their other belongings to the opposite side of the island. No one can say, after reading Mrs. Gill's account of the desolate encampment at "Mars Bay," which they occupied for many weeks, that science has not its heroes and its martyrs. There was a choice of routes to the bay—one by circumnavigating the island, on the chance of somehow effecting a landing, the other over the trackless wastes of clinker. All their supplies and their drinking water had to be for-

* *Six Months in Ascension. An Unscientific Account of a Scientific Expedition.* By Mrs. Gill. London: John Murray. 1878.

warded to them from "Garrison," the headquarters of the tiny settlement. Their fare was rough; the floor of their tents something like rough slag; their domestic arrangements most comfortless; the climate all that was abominable; and by night and day they were exposed, of course, to a plague of insect pests. Moreover the devoted wife, who had caught the sacred fire from her husband's scientific enthusiasm, had to keep alternate watches with him and the drowsy servant over the aspects of the heavens. No opportunity was neglected by these indefatigable observers. Mr. Gill was worn out by hard work and privations, and at one time his health threatened to give way; but we are happy to say that his perseverance had its reward. "Then the work was done—that is, apart of course from the laborious calculations which must ensue. As I write now these are still unfinished; but the reductions are sufficiently advanced for me to say, almost with certainty, that our six months of anxiety have been crowned with success."

We shall be glad if his very successful researches lead Mr. Gill to undertake similar expeditions, as we are sure that his sympathetic wife will accompany him. For we have every reason to congratulate her on the happy thought which made her write a popular account of the visit to Ascension. We are not giving the book too high praise when we say that it is nearly all that such a book ought to be. There is just enough of astronomy and science in it to interest our intelligence and give it the appropriate colouring. Mrs. Gill has the pleasant habit of looking on the bright side of things; although, perhaps, one might say that she could hardly help that where sunshine was a curse and shadow a luxury. She has an engaging style and graceful powers of description, with a cheerful humour that helped her to make the best of things. The variety to be found in her chapters is extraordinary, considering the circumscribed space, the very limited society, and the unpicturesque monotony of the scenery. Now we have a serio-comic narrative of the sorrows and surprises that awaited her in her housekeeping; of her feelings on discovering that there were neither butchers nor greengrocers, and that the baker only baked three times in the week, when unfortunately she had applied to him on the morrow of the baking; and that the milk on the island was reserved for the sick, who were always reduced to short allowance. We hear how she was left at Mars Bay without a cook; while, bending over the saucepans on the galley fire, with the thermometer marking a fabulous temperature, she began her practical education in cookery; how a drunken servant disappointed them of their Christmas dinner, and they had to fall back on the bacon and eggs which was all they obtained by industrious foraging. On the other hand, she is equally at home in dilating on the glorious splendour of the tropical nights, where the watchers kept their gaze riveted on the heavens; or in describing those magnificent and mysterious rollers which upheave themselves from an apparently tranquil ocean to dash and break against the precipices in trembling cascades of foam. She is the liveliest of companions in such excursions as were to be made, whether to the turtle-ponds, or the water-tanks, or the craters of extinct volcanoes; and we trust that her book may have half the success it merits, in which case, as times go, she will have little reason to complain.

THE RETURN OF THE NATIVE.*

THE question is perpetually suggesting itself nowadays whether it is better for a novel-writer to be clever or entertaining. Personally we have no doubt on the matter, but then the feelings of even a professional critic are apt to get the better of his principles. Possibly, in the interests of the highest art, we ought to hold up to the discriminating admiration of our readers the talent which we are compelled to recognize, although it has impressed more than delighted us. But we fear that if we took that sublime view of our vocation we should fail to carry our readers along with us; and, on the whole, it may be more advisable to be absolutely frank and speak out all we have upon our minds. We may appreciate the depth and brilliancy of George Eliot's later writings; but somehow we cannot fall into the same kindly and familiar companionship with *Middlemarch* and *Daniel Deronda* as with *Adam Bede* or the *Mill on the Floss*; and there is a rising school of novelists, of which Mr. Hardy is one of the ablest members, who seem to construct their fictions for themselves rather than for other people. It would be scarcely fair to say that they are dull; and they give us the fullest persuasion of a latent power which would enable them, as our ideas go, to write infinitely more agreeably if it pleased them. In one respect they resemble those fashionable and self-opinionated artists who embody their personal conceptions of art in forms that scandalize traditional opinions. In another respect, as we are glad to think, they differ from them very widely. For, whatever may be our estimate of their manner in the main, there is no denying the care they bestow upon their workmanship, and this is a thing to be grateful for in these days of slovenly writing. After all, however, we are brought round again to the point we started from. We maintain that the primary object of a story is to amuse; and in the attempt to amuse us Mr. Hardy, in our opinion, breaks down. In his case it has not been always so; but he would seem to be steadily subordinating interest to the rules by which he regulates his art. His *Under the Greenwood Tree* and *Pair of Blue Eyes*, partly perhaps because of rather unpromising names, were books that received less attention than they deserved. But his *Far from the Madding Crowd* was launched under favourable circumstances in a leading magazine, and—with reason—it won him a host of admirers. There may have been too much of the recurrence of marked mannerisms in it, with a good deal of what was hardly to be distinguished from affectation. But its characters were made living and breathing realities; there was a powerful love tale ingeniously worked out; the author showed a most intimate knowledge of the rural scenes he sympathetically described; and, above all, as is almost invariably his habit, he was quaintly humorous in the talk which he put into the mouths of his rustics. In this *Return of the Native* he has been less happy. The faults of *Far from the Madding Crowd* are exaggerated, and in the rugged and studied simplicity of its subject the story strikes us as intensely artificial. We are in England all the time, but in a world of which we seem to be absolutely ignorant; even a vague uncertainty hangs over the chronology. Every one of the people we meet is worked in as more or less of "a character"; and such a coincidence of "originals," under conditions more or less fantastic, must inevitably be repugnant to our sense of the probable. Originality may very easily be overdone, especially when it is often more apparent than genuine. We need not say that Mr. Hardy's descriptions are always vivid and often most picturesque. But he weakens rather than increases their force by going out of his way for eccentric forms of expression which are far less suggestive of his meanings than the everyday words he carefully avoids. His similes and metaphors are often strained and far-fetched; and his style gives one the idea of a literary gymnast who is always striving after sensation in the form of some *tour de force*. In his very names he is unreal and unlifelike; so much so that we doubt whether nine in ten of them are to be met with in the pages of the London Directory. It is true that they may possibly be local for all we know to the contrary; and, if so, we may praise them as being in happy harmony with the theatrically local colouring of his fiction.

At the same time, having decided to write a story which should be out of the common, Mr. Hardy has shown both discretion and self-knowledge in the choice of its scene. It gives him ample opportunity for the display of his peculiar gifts and for the gratification of his very pronounced inclinations. Egdon Heath is one of the wildest spots in all England, and is situated among some of the most sequestered of parishes. The people seem to know nothing of high-roads or stage-coaches; there is nothing of a market-town in the immediate vicinity where the men might brush up their bucolical brains by weekly gossip on a market day; there is not a good-sized village, and hardly even a hamlet. The inhabitants live chiefly in lonely dwellings, where the snow heaps itself round the doors in the dreary winter-time, and where they lie listening in their tempestuous weather to the melancholy howling of the winds. The very public-house stands by itself, and bears the quaint sign of "The Quiet Woman," who is a lady carrying her head under her arm. So that naturally we have the unadorned simplicity of nature in every shape. There must have been landed proprietors, we presume, and yet we hear nothing of a squire; while there is only incidental notice of a parson when some of the natives are joined together in matrimony. The people above the class of labourers or paupers are still in very humble stations, and for the most part extremely eccentric in their habits. There is a veteran captain of the merchant service who has come to moorings in his old age in a solitary cottage in the middle of those desolate wastes, which give every convenient facility for assignations to his beautiful granddaughter, who is one of a pair of heroines. There is a Mrs. Yeobright, who is tolerably well-to-do and the mother of "the Native" whose return is chronicled; and there is the innkeeper, Mr. Wildeve, who is comparatively rich, and who figures relatively as a man of the world and a gay and fascinating Lothario. It is of those somewhat unpromising materials that Mr. Hardy has undertaken to weave his romance, and he has so far overcome the initial difficulties by making his hero, "the Native," with his leading heroine, superior by their natures to their situation and surroundings. It was their lot to be born into "a wale," as Mrs. Gamp says, and they have to take the consequences. But we are given to understand that, had their circumstances been different, or if fortune and ambition had served them better, they might have played a very different part in the grand drama of the world:—

> Eustacia Vye was the raw material of a divinity. On Olympus she would have done well with a little preparation. She had the passions and instincts which make a model goddess—that is, those which make not quite a model woman. Had it been possible for the earth and mankind to be entirely in her grasp for a while, had she handled the distaff, the spindle, and the shears at her own free will, few in the world would have noticed the change of government.

Again, "in Olym Yeobright's face could be dimly seen the typical countenance of the future. Should there be a divine period to art hereafter, its Phidias may produce such faces." Those natures of *élite* tend towards each other instinctively. And when the lovers have one of their meetings, after three short months of acquaintance, "they remained long without a single utterance, for no language could reach the level of their condition. Words were as the rusty implements of a barbarous bygone epoch, and only to be occasionally tolerated." The harmony of ill-tutored minds so highly pitched could hardly fail in a sensational novel to end in discord and tragedy. Clym prevails on Eustacia to marry him; he loses money and health, and sees his dreams of good fortune gradually dissipated, while the brooding shadows of despondency fall thickly on his domestic horizon. For Eustacia is equally disenchanted of her expectations. She had given ad-

* *The Return of the Native.* By Thomas Hardy, Author of "Far from the Madding Crowd," &c. London: Smith, Elder, & Co. 1878.

miring devotion to her husband, contrasting him with the boors about him; she had recognized the superiority of his manners, acquirements, and intellect; but she had looked, above all, to being introduced by him to some of the wonders of the world, and to the dazzling delights of Parisian society. For before Clym Yeobright is presented to us as "the Native" returning to his native wilds he had been serving an apprenticeship as a shopman in Paris. But when Eustacia sees herself shut up with him in a lonely cottage on that Egdon Heath of which she has grown so heartily sick; when she sees him labouring to keep their bodies and souls together by cutting furze and sods like a common day labourer; when she sees him covering up his expressive eyes with spectacles; and, in short, when she is settling down to the monotony of penury, feeling at the same time that she might have done far better for herself, then she decides to take leave of the world. With "her soul in an abyss of desolation seldom plumbed by one so young," she quits her home to strike across the moors, "occasionally stumbling over twisted furze-roots, tufts of rushes, or oozing lumps of fleshy fungi, which at this season lay scattered about the heath like the rotting liver and lungs of some colossal animal," and seeks a refuge from her troubles in a deed of desperation. She and her husband, and her admirer, Damon Wildeve, all have a meeting at last in the gloomy waters; and the crowning horror of a succession of sombre descriptions is in the search for the senseless bodies in Shadwater Weir. Unfortunately, our sympathies have never been strongly enlisted in any of the three. Even the style of Eustacia's beauty is so vaguely and transcendentally described that it neither wins our heart nor takes our fancy. For the rest she is a wayward and impulsive woman, essentially commonplace in her feelings and wishes, who compromises herself by vulgar indiscretions. Thus she bribes a country lad to help her to carry out a whim of hers by permitting him to hold her hand for fifteen minutes, although she knows that he exacts those terms because he has fallen hopelessly in love with her. Damon Wildeve, the innkeeper, although in a measure idealized in a doubtful atmosphere of romance, is in reality an underbred country clodhopper who plumes himself on his substance and gentility, and an education superior to that of his neighbours; while Clym Yeobright is a moon-struck dreamer, who seems singularly out of place among the eminently practical population of Egdon.

Still we would not be misunderstood, nor would we wish to do Mr. Hardy injustice. We think he has been injudicious in his invention of characters, and that he has deliberately prepared disappointment for us in his method of treatment, if he aimed at making his story in any degree realistic. But, as usual, there are dialogues of true and quaint humour, which have never been rivalled by any writer of the present day, and which remind one of Dogberry and Verges; and there are many *tableaux* of wild and powerful picturesqueness. Take, for example, the opening scene, where the whole of the barren country on a dreary November night is kindling to the blaze of the roaring bonfires; when we are introduced to the old-fashioned parishioners of Egdon, crowding round the pyramid of furze, thirty feet in circumference, that crowns the summit of the tumulus of Blackbarrow; and there, in his description of the excited little mob, we have some of Mr. Hardy's most distinctive touches:—

> All was unstable: quivering as leaves, evanescent as lightning. Shadowy eye-sockets, deep as those of a death's head, suddenly turned into pits of lustre; a lantern jaw was cavernous, then it was shining; wrinkles were emphasized to ravines, or obliterated entirely by a changed ray. Nostrils were dark wells; sinews in old necks were gilt mouldings; things with no particular polish in them were glazed; bright objects—such as the tip of a furze-hook one of the men carried—were as glass; eye-balls glowed like little lanterns. Those whom Nature had depicted as merely quaint became grotesque, the grotesque became preternatural—for all was in extremity.

Or, again, when the fair and stately Eustacia Vye steals through the darkness of the night into the glowing reflection of the balefire to keep an appointment with Wildeve, who was then paying his court to her; or when Wildeve, in his wretchedness and recklessness, later in the story, sits down to gamble by lantern-light on the lonely moors with an enemy and rival, who has thrown himself into the game with all the rancour of inveterate hatred. They are scared by spectral shadows falling across the stone table and the dice, which turn out to come from a gang of moorland ponies. When the lantern is extinguished by a great death's-head moth, they replace it with the handful of glowworms that they gather, and the wild game goes on, in its alternations of triumph and despair, till Wildeve loses his last sovereign. This scene has striking vividness and power. There can be no doubt that Mr. Hardy has no ordinary talent; and we regret the more that he should not condescend to human frivolity, and exert his unquestionable powers in trying to be more natural and entertaining. We dare say the effort would soon come easily to him, and then our gratitude might give him less stinted praise.

DOBSON'S CLASSIC POETS.*

THIS book is a singular instance of the follies that well-meaning authors and respectable publishers can perpetrate between them. So far as we can gather both from the book itself and from its bewildered and bewildering preface, Mr. Dobson's object seems to have been to make the great epics of the world (this is what he means by classic poems) intelligible and accessible to the many and the busy. The plan is not a bad one; but, like most other plans, it depends for praise or blame on the mode of its execution. Even admitting that few people do, as a matter of fact, read their Ariosto and their Milton, it remains to be seen whether more will read a dull hash of them, and, if so, whether they will be any the better for the achievement. Mr. Dobson says with truth that "a complete and intimate knowledge of these [epics] could only be obtained with little loss [why little less?] than the labour of years"; and it is to persons who cannot give that labour that he hopes his work will prove acceptable. But surely there is a *tertium quid* between a complete and intimate knowledge and Mr. Dobson. Pope's Homer and Fairfax's Tasso, and even *Paradise Lost* itself, might be "perused," as Mr. Dobson would say, with something less than "the labour of years." The only justification of a book like Mr. Dobson's, as of so many more of these short cuts to literary knowledge that are now so much in fashion, is that it should be true as far as it goes, and should stimulate the reader to make himself acquainted with the masterpieces it is describing. It should in fact be really, and not only in name, an Introduction. But, for the writing of such a book, certain qualifications are desirable which seem to have been overlooked in the present instance. The author should have read, and should be able to write. He should not suppose that he is the first person that ever handled his theme, and he should consequently pay some little regard to what others have said on the subject. He should have some faint powers of distinguishing between the real and the imaginary; if he deals with the Iliad he should not only have heard of the Homeric question, but should know what it means, and one or two of the most probable solutions of it. He should know what to say and what to leave unsaid in his biographies. More important still, he should be able to select his poems, and not publish a book on *The Classic Poets* (even allowing the title to stand as denoting only the great *epic* poets) and make no mention whatever of the Æneid, the poem which for sixteen centuries was universally regarded as the chief poem of the world.

The epics on which Mr. Dobson discourses are the Iliad, the Nibelungenlied, a poem which he curiously calls "Cid Campeador," the *Divine Comedy*, the *Orlando*, the *Jerusalem*, the *Lusiad*, the *Faërie Queene*, the *Paradise Lost* and *Regained*. Except for the extraordinary omission we have mentioned, there is not much fault to be found with the list, though to be sure neither the *Poem of the Cid* nor the *Faërie Queene* is strictly an epic. It is when we come to see what Mr. Dobson has to say that our astonishment begins. His treatment of Homer is his masterpiece. The title-page promises us a description of "the life and times" of each poet; and it will be admitted that a full account of the life and times of Homer is a work that it would be easier to undertake than to perform. Accordingly Mr. Dobson leaves out "the times," but in revenge he gives us a "life" which even Mr. Gladstone's astonishing Primer can hardly rival. He has the grace to say that the account given by Herodotus "is considered of doubtful authenticity by some critics." We confess that this phrase for the moment took us in. We thought that Mr. Dobson referred to the remarks made by Herodotus in his history on the date of the Homeric poem; or, as Herodotus of course put it, of Homer. This may fairly be described as "of doubtful authenticity." But, unfortunately, it is not this that Mr. Dobson means. He means the *Vita Homeri* by the pseudo-Herodotus; and by "authenticity" he means "genuineness." However, doubts and critics do not move Mr. Dobson; and accordingly we have a *Vita Homeri* of his own "for English readers"—with the whole story of Tychius the leather-dresser and Thestorides the schoolmaster, and the blindness of the bard, and the unkindness of the people of Cumæ, and all the rest of it. After this it is not surprising that Mr. Dobson's account of the poem and his reasonings from the poet's statements are delightfully precise and matter of fact. For example:—

> According to various Greek legends, the army consisted of upwards of one thousand ships [imagine an army "consisting of ships"!], and as the largest of these contained about two hundred and the smallest fifty men, *it is believed* that nearly one hundred thousand allied Greeks and Achæans were engaged in the expedition.

There is a positiveness about this which will at all events delight those who are tired of the "Solar-myth" theory. We, who claim to be among the number, can only lament that Mr. Dobson has not argued a little more strongly for his position; or, at least, has not convinced us by his general accuracy that he is likely to be right. Alas! where we are able to test him, we find him sadly wanting. Andromache's father and seven brethren are slain, not in Thebe the city of the Cilicians, but in *Thebes*—whether the Egyptian or the Bœotian, Mr. Dobson does not say. Priam goes to the tent of Achilles "by stealth," though we seem to remember that Homer describes him as "followed by all his friends, who wept as though he were going to death." But it is needless to dwell on these flaws in a building whose foundations are shifting and whose structure is rotten. We will leave Mr. Dobson's treatment of Homer with his concluding passage, a specimen of platitude and indecision which it would not be easy to match:—

> The attractive nature of Homer's Iliad is shown in more modern days by the extraordinary number of translations which have appeared—a mere enumeration of these would be a difficult task—many displaying so much spirit and scholarship as fairly to entitle them to a place in the library of all lovers of poetry and classical learning. The numerous authors of these would no doubt find profit in their study of the original and the work of translation; though it is to be feared there is some degree of inutility in their number, as well as in the many discussions and controversies regard-

* *The Classic Poets; their Lives and their Times, with the Epics epitomized.* By W. T. Dobson. London: Smith & Elder. 1879.

ing the site of Troy, the reality of Homer's existence, and his reputed authorship of the poems with which his name has been for many centuries associated.

One of the oddest of Mr. Dobson's peculiarities is that, although about a third of his book is composed of extracts from poetical translations of his epics, it is by the merest chance that he lets his readers know where the translations come from. In his account of the Iliad he falls, quite by accident apparently, into a passage of Pope, and again, quite by accident, into one of Chapman, without letting the unlearned reader even know that each is not an example of Mr. Dobson's own versatile talent. No name of Pope or Chapman appears in his pages; nor in the chapter on the *Cid* does any note indicate that the versions are Frere's or any one else's. Mickle and Wright do receive honourable mention in the chapters on the *Divine Comedy* and the *Lusiads*, but more, we imagine, by good luck than of set purpose. We can hardly suppose that Mr. Dobson intended to pass off Pope's and Chapman's work as his own, just as his Herodotus tells us Thestorides did with Homer's poetry. And yet the book is *ex hypothesi* intended for the ignorant, for those who have not only not read the poems in the original, but who have not even read translations of them, and who therefore may not be supposed to know the difference between Chapman and Pope, or, for the matter of that, between either of them and Mr. Dobson. A short note here and there, to point out the different translators, would have added to the artistic perfection of the volume.

Of the accounts of mediæval poems, that of the *Divine Comedy* is perhaps the best; and indeed it is a testimony to Dante's greatness that the very feeblest hand becomes strengthened in dealing with him. We must not be supposed to mean that Mr. Dobson's account of him is good, but only that it is less bad than his account of other poets and poems; better than that of "Cid Campeador," for instance (what has become of the "El"?), and that of the poor misspelt, mal-introduced, and mangled *Faërie Queene*. Mr. Dobson's acquaintance with Spanish literature and history is on a par with his knowledge of the Homeric question, as may be seen from his remarkable statements that in the thirteenth century the "Spanish, or rather Castilian, poetry *became assimilated in spirit and form with the Arabic*" (a wild and altogether unfounded assertion), and that Castile was "a city." The life of Ariosto is told in an utterly unsympathetic way, without a single one of those characteristic anecdotes of the man in which his biographies abound, or a single reference to the nature of burlesque poetry. Nor is Mr. Dobson any better in dealing with his own countrymen. Spenser's life is told in a style that robs it of blood and sinew—in the baldest, most inconsequent, feeblest manner. Why did not Mr. Dobson go to Mr. Hales's excellent biography in the Globe edition of Spenser, or to Mr. Kitchin's in the Clarendon Press edition? Neither book is inaccessible, and each would have shown him what to say and what not. Each would have suggested to him the distinction between history and legend in biography, and would have taught a better mode of dealing with the friendship between Spenser and Raleigh than that which describes it as "originating at first from congeniality of soul and similarity of taste in the polite arts." We must leave it indeed to Mr. Dobson and his readers to decide what is gained by taking a poem like the *Faërie Queene*, the whole value of which consists in its poetry, stripping it of its poetry, and presenting it in the form of a long and rambling story. Without its dress of gorgeous poetry the *Faërie Queene* is nothing; every one admits that it is nothing. Its heroes and monsters and their wanderings and adventures are only endowed with individuality when the poet has clothed them in the garment of his verse. In Mr. Dobson's version the "palace full of echoing corridors," to use an expression that he quotes, becomes a museum of skeletons—of skeletons, too, inaccurately classed and named. For example, Prince Arthur—the shadowy presence which, as it were, towers behind the whole action of the poem—is hardly referred to in this rendering of it; and, still worse, no mention whatever is made of the double nature of Spenser's allegory—its philosophical and its historical meanings—without an understanding of which the whole poem is meaningless. Lastly, Milton fares no better. To read the pages which Mr. Dobson devotes to his life one would imagine that, except for the *Paradise Lost* and the *Paradise Regained*, he wrote nothing but pamphlets; not a word is said of *Comus*, or *Lycidas*, or the sonnets. As to criticism, all that Mr. Dobson ventures to do is to pitchfork into his text a passage of Campbell—very good as far as it goes—about Milton's use of pagan images, the reader being left to infer that this is a summary of all that has been or could be said of Milton's genius; while of remarks of his own, Mr. Dobson gives us half a page of protest against the title of *Paradise Regained*, which, as he says, "is not realized in the work." It has never occurred to him that there is a theological and artistic correspondence between the two poems; and that if the one describes the loss of Paradise by the triumph of the Tempter, the other describes its recovery by his defeat. But our readers are by this time tired of Mr. Dobson, as we are. We will leave him with one more utterance of our never-ceasing wonder what it can be which makes a man write a book of this kind—which makes a man who has nothing in the world to say that has not a hundred times been said better, take the trouble which even these pages must have cost, to say it?

KINAHAN'S MANUAL OF THE GEOLOGY OF IRELAND.*

WHATEVER may be her other grievances, Ireland has no reason to complain of her geology having been neglected. In the course of the past year three works of high value have appeared, dealing with the geological structure and resources of the island with a degree of fulness and accuracy which leaves little to be desired. The handsome quarto of Professor Dr. von Lasaulx, of Breslau, published at Bonn, gave a picturesque as well as scientific narrative of a vacation tour undertaken by himself and his colleague, Dr. Ferdinand Römer, for the purpose of exploring the natural features of Ireland. Shortly before the meeting of the British Association in Dublin a most excellent introduction to the study of the island was put forth by Professor Hull, the Director of the Geological Survey, in *The Physical Geology and Geography of Ireland*, to the merit of which we drew attention at the time (*Saturday Review*, April 27, 1878). Ample, and even exhaustive, as it seemed to be in its treatment both of the external aspect and the internal stratification of the island, this admirable little manual for the scientific tourist or geologist was far from rendering superfluous the work with which Mr. Kinahan has recently presented us in his *Geology of Ireland.* Based, on the whole, upon the same foundations of scientific data, and arriving in the main at the same conclusions, Mr. Kinahan approaches his subject from a point of view entirely independent, and maintains throughout an individuality of his own. Officially connected, like Professor Hull, with the Geological Survey of Ireland, he has had the advantage of access to the store of observations and researches, as well as of material specimens, accumulated by that department, in addition to his personal investigations or the aid of private memoirs. And, if less picturesque or artistic in style and mode of handling than that of his colleague, his treatise is beyond comparison more comprehensive in scope as well as more systematic in arrangement and method. That he was led to undertake the task was, he informs us, owing to the original and veteran director of the Survey, Sir Richard Griffiths, having been incapacitated by stress of official work from carrying into effect his intention of publishing a Geology of Ireland. It is to the "father of Irish geology"—carried off by death, we regret to add, in the short interval before publication—that he dedicates the volume with which he proposed filling up the gap thus left, aided as he has been by the personal counsel and experience no less than by the maps and writings of that distinguished master of the subject. Of Professor Jukes's maps and written notices Mr. Kinahan has largely availed himself, and to private friends without number, including the official staff of the Survey, he is forward in acknowledging obligations. Amongst their ranks another grievous blank has been since made by the death of Dr. Oldham, whose name will be perpetuated by its having been stamped, so to say, upon the oldest recognizable fossil relic of organic life from the Irish rocks, *Oldhamia antiqua*.

Mr. Kinahan pursues in the building up of his treatise the natural order of superposition, beginning from the lowest or earliest strata. Rocks older than the Cambrian formation are unknown in Ireland, though Jukes ventured the suggestion that some of the highly metamorphosed beds of the North of Ireland might possibly be pre-Cambrian. No equivalent to the *eozoon* of the Laurentian series heralds the dawn of life in Palæozoic Irish seas. Nor has the subjection of the Cambrians of Ireland to natural groups been found hitherto a feasible task, especially towards the eastern districts; whilst to the west it is greatly complicated by the rocks being metamorphosed and the fossil evidence destroyed. Rocks of the Cambrian series are distinctly traceable in Dublin, Wicklow, and Wexford, and are shown by their Longmynd fossils to belong to Sedgwick's Lower Cambrians. In no case, however, have they yielded Upper Cambrian fossils. An excursion to Howth during the recent British Association meeting gave students of geology the opportunity of verifying the metamorphism of the rocks on the south side of that promontory, consisting, as they do in the main, of argillates (clay-schist), and incipient quartzites (quartz-schist), whilst on the north side they remain unaltered. On the latter side, in greenish shales, *Oldhamia antiqua* has been sparingly met with. South of the Liffey the Bray Head group carries on this series, extending along the coast to within a few miles of Wicklow, and displaying a thickness which, estimated by the succession of alternate synclinal and anticlinal curves, has been set down by Jukes and Noyes at between three and four thousand feet. Associated with the Cambrian rocks of this group are great reefs and protrusions of quartz rock, most probably intrusive. Those of the Wexford group lie more regularly than the rest. They have been partially metamorphosed, yet not to such an extent as to obliterate their fossiliferous character. Their depth is calculated at fourteen thousand feet, the lower strata consisting of schists graduating through gneiss into granite. Mr. Kinahan's sections, though drawn, we may say, with ideal lines needlessly rectangular, show well the faults and intrusions to which these beds have been subjected upon the Bannow coast of Wexford. In West Galway and Mayo, between Clew and Galway Bays, there is a vast thickness of metamorphic and submetamorphic rocks, the lower groups of which have been sufficiently established as Cambrian by Griffiths and King. These rocks have a thickness of eleven thousand feet at the least, the

* *Manual of the Geology of Ireland.* By G. Henry Kinahan, M.R.I.A., &c., of H.M. Geological Survey. With Illustrations and Map. London: C. Kegan Paul & Co. 1878.

upper two or three thousand feet being recognized as Llandeilo, or newer age. There is a known difficulty in drawing the line between the Cambrian and Cambro-Silurian rocks, as is the case with the red and green grits, shales, and slates to the east of Granard, County Longford, which were considered by Foot to be of Cambrian age, overlaid unconformably by the Cambro-Silurian rocks; but, for lack of proof of this unconformability, as well as of fossil remains, they have been referred by Jukes to the Cambro-Silurians, the term introduced by Professor Phillips as a distinction from the Upper Silurian. Prior to the Silurian age, the Cambro-Silurian rocks of Ireland were uplifted, metamorphosed, and denuded, there being everywhere a marked break, indicating a vast interval of time, during which Mr. Kinahan brings forward evidence of two periods of vulcanicity—one, the pouring out of the interbedded eruptive rocks; the other, the time of the metamorphism of the Cambro-Silurian rocks and the intrusion of the masses of granite.

Our author thus traces back what we may call the infancy of the sister island, its baptism by flood and fire, and its earliest manifestations of organized life. With the Silurian period a more varied range of fossil fauna comes into view, with types in which the evolutionist has no difficulty in recognizing species continuous with those of the present day. The Silurians to the west of County Cork, first worked out by Griffiths, have no defined upper boundary, but form part of a continuous sequence extending up through the Lower Carboniferous into the Upper Carboniferous or coal measures. In Kerry, Galway, and Mayo they were upturned and denuded prior to the deposition of Carboniferous beds. In classifying with the Carboniferous series the Old Red Sandstone our author prepares himself for much opposition. It is, however, a point on which he has armed himself with arguments of unquestionable force, and on which his close personal investigations entitle him to speak with exceptional authority. It was in dealing with the Cork rocks—the most typical of the series—that Jukes was led to embrace the conclusions originally arrived at by Griffiths. He had in the first instance come to Ireland with a full belief in the Devonian system as that to which those formations were to be referred. After working out similar groups of rocks on the continent of Europe as well as in England, he at length satisfied himself that one portion of the rocks of the Carboniferous formation may be principally calcareous accumulations, whilst another portion on exactly the same horizon may be composed entirely of arenaceous or argillaceous materials. Nowhere in Ireland has the Old Red a defined upper boundary, one group graduating into the other, though usually the lowest grey and blue beds of grits and shales of the Carboniferous formation are taken as its upper limits. The floor of the Carboniferous sea or lagoon being very uneven, and the sea in places studded with islands or having promontories jutting out into it, shore beds are met with on very different horizons, which nevertheless, from the conditions under which they were formed, are, both in aspect and in regard to the fossils they contain, very similar to the oldest rocks. They partake, as Portlock writes, of a double position, lying geologically at the base of the Carboniferous formation, while mineralogically they occupy a higher level on different horizons in the upper rocks of the formation. These shore accumulations are the cause of much confusion, graduating for the most part horizontally into beds like the Lower Limestone shale, their real geological position being at the same time much above that group. A section of our author's (fig. 5) shows well the changes from the shore-beds into the Carboniferous limestone, the former beds (to the left of the diagram) being margined by the Fenestella limestone characteristic of the lower group of that formation, while the true position of the shore-beds is in the Burren or Upper Limestone represented to the right, where successive groups form a regular sequence upwards from the Old Red Sandstone. All attempts to correlate the Irish coal measures (Upper Carboniferous) with those of England, either lithologically or stratigraphically, have failed. If the fossil fauna alone be considered, and the flora ignored, a forced correlation with our own Lower Coal Measures may, as Baily has pointed out, be established; or, if the flora alone be taken into account, with the Upper Coal Measures of England. But, in fact, the Irish coal deposits, which are neither abundant nor of high bituminous quality, have a type of their own, approaching in some cases, Mr. Kinahan remarks, to the culm measures of Devonshire. They are divided by him into the Upper, Middle, and Lower beds, and their respective thicknesses are shown in a carefully prepared table. The greatest depth, 2,050 feet, is attained by the Upper Measures of West Munster. In Clare, Foot was of opinion that there were measures between three thousand and four thousand feet thick, and Mr. Hull has expressed his belief that extensive coal deposits once covered a large part of the central plain of Ireland, but that this potential element of wealth has since been swept away by the Jurassic flood, which heaped up the *débris* to cover from atmospheric waste the vast carboniferous stores of her more fortunate sister.

The Carboniferous period in Ireland is followed by a vast gap, which our author does much to fill up by his classification of the Permian and Triassic rocks, the two series being intimately connected together, though forming rather a group of beds at the base of the Jurassic than a separate formation. The Irish Permians are classed by him as mesozoic. Previously to the deposit of the Mesozoic series, the Palæozoic rocks were ruptured, upturned, and extensively denuded, a process which was again repeated after the Cretaceous period; the flint, gravels, or shingles of the North of Ireland, with the fossils found in the interstratified shale-beds, bearing proof of Miocene age. The Cainozoic age which followed has left its traces chiefly in the products of vulcanicity, great fissure eruptions succeeding one another at short intervals, and pouring forth the vast sheets of molten matter which are now seen in Staffa and the Giant's Causeway. From this period when the constructive forces which went to make up the geological history may be said to have culminated, our author passes to the stage of displacement and denudation, when the basis of the valley system of Ireland was laid down. Here he finds occasion to urge with great force the distinctive views upon the origin of rivers and watercourses which he propounded not many years back in a special work upon the subject, into which we entered fully at the time (*Saturday Review*, March 6, 1875). In contending that rivers are due to the valleys, not valleys to the rivers, he is supported by many arguments drawn from the lines of fissure determined by breaks or shrinkage in the ruling strata of various districts, the natural drainage following upon and deepening the channels thus marked out. The phenomenon of the great ice sheet, with the accompanying drift and erratic blocks, the formation of raised beaches, and the submergence of the land, which has greatly affected the aspect of the country, are treated of in an admirable chapter, as are also the cooms or corries which have always formed a perplexing feature in the scenery of hill-sides. The geological history of Ireland is brought down to the introduction of man upon the scene, and amongst the most attractive parts of the book are those which treat of the prehistoric remains of the island, the "cash" or wooden road submerged beneath the peat in Antrim and elsewhere, the bog huts, the crannogs with their rude implements, deposits, and remains of food, clothing, and household stuff, the methers or barrels of fossil butter or lard. The discussion of mines and minerals, including the gold finds of ancient and modern days, brings Mr. Kinahan down to the Ireland of the present and the future, her resources and prospects, including a most valuable classified list of the minerals and metals, with the localities over which they are distributed. As a practical ending to this instructive book an account is given of the native manures or mineral substances that may be used as fertilizers of the land, and an estimate of the water supply, in which the scientific survey of the sources and the distribution of this prime necessary in relation to the geological strata is made to subserve the economical forecast of what may be done for the future wealth of the country. The admirable geological map appended to the volume should be kept before the eye as an interpreter and illustrator of the contents throughout.

THE INDIA OF MEGASTHENES AND ARRIAN.*

THIS little work is of German origin. More than thirty years ago Dr. Schwanbeck of Bonn collected all the remains of the writings of Megasthenes, and they have now been rendered into English by Mr. McCrindle, Principal of the Government College at Patna. To these the translator has added the first part of the *Indika* of Arrian, and he intends to follow it up hereafter with a translation of the narratives of Alexander's invasion of India, as given by Arrian and Quintus Curtius. To Greek writers we are indebted for the very corner-stone of Indian history and chronology. The identification of their Sandracottus with the Indian Chandragupta has supplied a date by which all our limited knowledge of Ancient Hindu chronology is regulated and tested. Without this guiding star we should be lost in myriads of years and the long succession of reigns of miraculous duration. For chronology and for history the Hindu mind had no taste. Its acute analytical and logical powers were devoted to philosophy, grammar, and criticism. In history and chronology its imagination ran wild, and the result is that, out of all the immense mass of Hindu literature, there is only one work, and that not an early one, which has any pretensions to the character of a history. It is not much better with geography. When Hindu writers get beyond the limits of their own country all their views are vague and imaginative, though they are laid down with a great show of authority and precision. It is admitted on all hands that there are gleams of truth in the Hindu writings, historic facts and heroic stories mixed up with a vast amount of fabulous and puerile matter. The difficulty is to distinguish the true from the false, and to assign some probable age for the apparent facts. Greek and Latin writers have, therefore, been diligently searched for references and allusions to Indian matters, in the hope of establishing synchronisms and identifications, or of verifying the statements of Hindu authors. No identification so important as that of Sandracottus has rewarded the researches of later enquirers; but their labours have not been barren.

Of the two writers before us Megasthenes was the traveller and observer who wrote from actual experience. Arrian was the literary man who worked up the observations of others. The work of Megasthenes, his "Indika,' as it appears to have been called, has been lost as a whole; but it was diligently used and quoted by writers like Arrian and Strabo, and so some very considerable parts of his writings remain, probably the most important and interesting parts. These passages, scattered through the pages of many writers, Dr. Schwanbeck collected, and we have them now in a complete form in English. It is right and convenient so to possess them for purposes of reference, but they are not likely to

* *Ancient India, as described by Megasthenes and Arrian.* Being a Translation of the Fragments of the Indika of Megasthenes, collected by Dr. Schwanbeck; and of the First Part of the Indika of Arrian, by J. W. McCrindle, M.A., Principal of the Government College, Patna. Calcutta: Thacker & Co. London: Trübner & Co.

throw much new light upon the subject. They have been diligently examined at first hand by historians, and Elphinstone gave a tolerably exhaustive summary of the Greek accounts of India in his well-known history. We may, however, take a brief survey of the travels and observations of Megasthenes. He was not the first Greek who wrote about India. Hekataios of Miletos (B.C. 549–486) referred distinctly to that country, and Herodotus and Ctesias followed. But all the Greek writers laboured under a great disadvantage. They were acquainted with Ethiopia, and, according to their notions, India was only a more distant part of Ethiopia. So they found in India what they were prepared to find, and Ethiopia was made to interpret India. They carried with them also their own mythology and heroic history, so they speak of the conquests of India by Herakles and Dionysos; but there can be no doubt that in one instance at least Megasthenes has mistaken Siva, the Hindu god, for Herakles, and the probability is that the unknown was often appropriated to and explained by the known. The natural result of such preconceptions was a frequent distortion or entire perversion of facts. Later writers were aware of these results, and spoke of their predecessors in very plain terms. Dr. Schwanbeck quotes the following from Strabo:—

> Generally speaking the men who have hitherto written on the affairs of India were a set of liars. Deimachos holds the first place in the list; Megasthenes comes next; while Onesikritos and Nearchos, with others of the same class, manage to stammer out a few words (of truth).

But Strabo has been kinder to Megasthenes in deed than in word. He has quoted passages from his writings which would otherwise have fallen into oblivion. Alexander's invasion of India brought forth quite a crop of memoirs. But they have all shared a common fate, and are known only by the quotations and abstracts of later writers. Next after these comes Megasthenes. He was sent by Seleucus Nicator, monarch of the Greek kingdom of Bactria, on an embassy to Sandracottus or Chandragupta, ruler of the Prasii or Prâchyas, whose capital was Palibothra, identified with the Sanskrit Pâtaliputra and the modern Patna. Megasthenes went on this embassy at a very interesting period. There had been a revolution. The old line of the Nandas had been overthrown, and Chandragupta had won the crown. But a greater revolution was imminent, or rather already in progress. Brahmanism was the prevailing religion, but Chandragupta's grandson Asoka was a Buddhist, and in his time Buddhism had more or less supplanted Brahmanism. Buddhist writings recognize Asoka as the great monarch and champion of their faith. But his religious inscriptions which have been found in widely distant places prove his Buddhism to have been of a very mild character. It has even been denied that they contain anything essentially Buddhist, and they certainly have more of the spirit than of the form of Buddhism. Were similar inscriptions found in Christendom, they might be described at Rome as Christian, not Catholic. So Megasthenes refers distinctly to *Βούτα*, or Buddha; and in his remarks upon the philosophers and the religious orders it is sometimes hard to say whether he refers to Buddhists or not, but in general he is distinct enough about the Brahmans. In the time of Megasthenes the caste system was in full vogue, so Brahmanism must have been in the ascendant; but the fact that Chandragupta married a daughter of Seleucus Nicator, shows that caste rules had become relaxed, or, what is more likely, that the monarch favoured the rising faith of Buddha. Instead of four castes, Megasthenes makes the number seven. He does not call them by their Hindu names, and his division seems to be of a professional character. Herodotus had found seven classes in Egypt, and perhaps Megasthenes had this fact in mind when he wrote of the Indians. His description of the life and manners of the Hindus applies in many respects to the people of the present day; in their simple food, their abstinence from strong drinks, their mode of dress, and their love of peace, they continue unchanged. Their laws are described as very simple, the people knew nothing of borrowing or usury, good faith governed their dealings, their property was left unguarded, and law-suits were rare. If this happy state of things ever existed it has long since passed away. It would be difficult to find a more suspicious and litigious being than the modern Hindu. The King, Chandragupta, is represented as living in a large palace with a body guard of women, and these women fully accoutred accompanied him in his hunting expeditions. His camp, when he took the field for war, contained 400,000 men. The capital, Palibothra, stretched ten miles along the bank of the Ganges, and was two miles wide. It was thus a very considerable city, but it probably contained many large gardens and groves, and, like its modern representative, it must have been built of frail materials, for no remains of the ancient city have been discovered. The fragments of Megasthenes describe the extent and climate of India, and give many details as to the number and size of the rivers. Its climate and its natural productions are also noticed, and, if the observer was correct in his statements, India was a much more happy country in his day than in later times. After describing its cereal productions, and its great crops of millet and rice, he goes on to say:—

> The soil yields, moreover, not a few other edible products fit for the subsistence of animals, about which it would be tedious to write. It is accordingly affirmed that famine has never visited India, and there has never been a general scarcity in the supply of nourishing food. For since there is a double rainfall in the course of each year—one in the winter season, when the sowing of wheat takes place as in other countries, and the second at the time of the summer solstice, which is the proper season for sowing rice and *bosporum*, as well as sesamum and millet—the inhabitants of India almost always gather in two harvests annually; and even should one of the sowings prove more or less abortive, they are always sure of the other crop.

He is careful to record many notices of the different tribes and animals of India, and it is upon these points that his veracity has been particularly impugned. "Travellers," says the adage, "see strange sights"; it might have added "and hear strange stories." Megasthenes guards himself occasionally with a cautious "It is said"; and, as it is not sure that we have his exact words, we cannot in fairness blame him for not having discriminated between what he saw and what he heard. India, according to its own books, was a land of marvellous creations. It had its "horse-headed men," "men who wrapped themselves in their ears," "crow-faced people," and "one-footed people." All these monstrosities are mentioned in Hindu books of the highest repute and sanctity; a foreigner therefore cannot well be blamed for recording such well-supported wonders. He states distinctly that he was told of these by the philosophers, and in several instances the terms he employs are either transliterations or exact translations of the original names, as Okupedes for Ekapâda (one-footed), and ὀπισθοδάκτυλοι for the *paschâd angulajas*, whose feet were reversed, and had their toes where the heels should be. These wild men "could not be brought to the King," nor could those who had no mouths, nor those who had only orifices for nostrils, nor those who had "the ears of a dog and one eye set in the middle of their foreheads." The two orifices for nostrils may only be an exaggerated description of the flat-nosed Tartar face. Strabo's ire is especially raised against Megasthenes for saying that there were men whose ears reached to their feet, but legends of such people are not wanting in the present day, and it is certain that the ears are sometimes stretched to an inordinate length by their being used for carrying heavy articles. It is impossible to understand the story of the ants as big as foxes that burrowed for gold. Lassen's supposition that they were Tibetan miners is hardly tenable. Probably they and the pigmies spoken of by Megasthenes are Hindu creations and known to him only by report. He speaks very fully about elephants, of which he had full opportunity of personal observation, and he is very correct. We are, therefore, disposed to agree with Schwanbeck, "that the relative veracity of Megasthenes is not to be questioned, for he related truthfully both what he actually saw, and what was told him by others."

A HERO OF THE PEN.*

THE people who talk Johnsonian English in the pages of *A Hero of the Pen* are called, some Americans, others Germans. They might as well be called Choctaws, or Chinese, or even Jovians or Martians, for any likeness they bear to the ordinary men and women who wander up and down the earth in this latter half of the nineteenth century. Turning from a careful, clear, and subtle sketch of the American woman as she lives and flirts in the works say of Mr. Henry James, to this indescribable farrago of impossibility and folly, is like turning from the perfect finish of a Dutch picture to the chance combinations of a painter's palette. There is very little intelligible story in this silly book, and still less of intelligible character-drawing. The author harps on the old string of misunderstanding going before love, which once did such good service, but which is now worn out and rusty; and no one can feel the smallest interest in the puppets which are set up to dance to the feeble melody. The heroine, Miss Forest, is strained and unnatural; a creature too entirely unsympathetic to make her fictitious history other than wearisome, even if it were possible. For what interest can any reader feel in a woman whose great ambition seems to have been to make herself as much like a mummy as is possible to living humanity, and one whose coldness is only equalled by her pride, and her pride only equalled by her insolence? From the first, one feels that she is only a jointed doll, and that when the author drew her it was without any clear consciousness of her personality.

A girl of "eighteen summers," perfectly beautiful, but wanting in "that expression of cheerfulness and *insouciance* which youth and beauty so rarely lack—that under-current of diffidence, and, above all, that touch of softness which a woman's face can rarely dispense with, and never without loss"; a girl whose "whole appearance betokened cold gravity of disposition, stern, calm, and undeniable self-consciousness"; a girl who says to the man about to make her an offer, while "a passing blush o'erspreads for an instant her features," "Speak, Mr. Alison"—strikes the false note at the beginning which the whole story repeats. Anything more unnatural and less American than this opening scene of the proposal can scarcely be imagined. "Truly a fertile year lies before you," says Miss Forest, when her lover tells her of his intention to go to Europe for a year. She would probably have said in real life—"My! but you'll have an elegant time out there!" Her farewell greeting—"Pray accept from me my best wishes for a pleasant journey and a safe return"—would have been:—"Well, I hope you'll have a good time anyhow, and I'll be real glad to see you back again." And instead of the stately "Speak, Mr. Alison," which answers the young man's "Miss Forest, may I address a question to you?" Jane Forest, born a German but bred an American, would have tilted herself further back in her rocking-chair, perhaps would have bitten her nails—many of them do—and then would have called out shrilly: "Well, I guess you can if you want to." When Mr. Alison, the young gentleman in question, and as

* *A Hero of the Pen.* A Novel. By E. Werner, Author of "Under a Charm," "Success, and How he Won it," &c. Translated by Sarah Phillips. 2 vols. London: Sampson Low, Marston, Searle, and Rivington. 1878.

stiff and unlike humanity as she is herself, makes her the offer of his hand and heart, she accepts him in the same queer, stilted manner. "You have put a question to me candidly, Mr. Alison," she says, "firmly and clearly, without the slightest hesitation or reserve," "and my answer shall be perfectly straightforward. I am aware of the feeling you profess towards me, and reciprocate it; when you return, I will place my hand in yours with the greatest confidence in our united future." Her acceptance, measured as it was, evidently rather astonished Henry Alison, as well as pleased him; for "a joyful expression lighted up through the coldness of Alison's features, but he immediately resumed the measured calm of his manner, as though he were ashamed of his involuntary exhilaration."

The story is complicated by the fact that Jane Forest has a long-lost brother. Her father, who dies immediately after this not too burning love scene between the young people, confides to his daughter as a sacred charge, first, the fact that she has a brother somewhere about Germany, but where, under what name, or in what circumstances he does not know; and then urges on her the immediate search for that brother, with whom she will divide her fortune. Consequently the beautiful young heiress goes off to Europe in the footsteps of her betrothed, carrying with her as her protector the family lawyer and man of business, one Mr. Atkins, but evidently, rich as she is, with neither a maid nor a courier. Her arrival at B., where her father's brother, Dr. Stephan, lives, is as melodramatic as it must have been uncomfortable. Her carriage breaks down when she is still at some distance from the town; but, instead of waiting quietly by the road-side, where at least she might have been sheltered from the wet until another carriage could be sent, she walks off with the first stranger who passes by, and who proves to be no other than a certain Professor Fernow, who lives in the very house to which she is bound. The antagonism which is to develop into love, and which the author is now using with such wearisome reiteration, begins as soon as the two meet. The Herr Professor, young, blue-eyed, sensitive, absorbed, marches on at speed; forgetting that he has a young lady in his charge, and ignorant that it is raining heavily, and that the roads are one mass of mud. When recalled to a knowledge of these facts by her expression of anger and fatigue, he takes off his heavy woollen plaid, places it on the ground, and makes her sit on it; and then, in spite of all her insolence and sarcasm, when they come to a pool of water a foot deep, catches her up in his arms and carries her safely through. After this they do nothing but flash, and writhe, and grow red and pale, and bite their lips; while sometimes the chest of one heaves, and sometimes the other stamps her feet when she is alone; and both "carry on" in the approved manner of two simpletons who are falling in love with each other, and playing at enmity by way of prelude. But why should they fall in love with each other? There is nothing to soften the one or attract the other. The Professor is reserved, sensitive, uncomfortable. Miss Forest is insolent to the extent of forcing him to tell her that, were she a man, he would answer her differently. There are none of those delicate little episodes which made the charm of *Success, and How he Won it;* no sentiment of gradual growth, of sweet young tenderness born of this gentle trait, or that noble action, but as yet afraid to confess itself. All is harsh, angular, abrupt, forbidding; and to give these quarrelsome approaches as the intuitive self-masking of love is to make the caterwauling of two angry cats the model on which to found an opera. The involuntary betrayal of the parting comes *à propos* of nothing. The two have fought bitterly ever since Jane Forest came to B., and in the only two interviews recorded; but why, save for the spite of a proud, ill-tempered young minx, who has been withstood by the man she insulted and strove to humiliate, why there should be the scene as it is given, when the Professor goes off to the wars, would puzzle the acutest critic to determine.

The story, slight as it is, takes one little line of complication when Jane Forest believes that Professor Fernow may turn out to be her long-lost brother. The evidence is something after the pattern of that famous "Have you a strawberry on your left arm?" —"No!"—"Then come to my arms, my long-lost child!" But novelists serve up terribly poor fare at times, and readers have to be content. However, it turns out that not he, but his big servant Friederich, is this brother; and Jane, who finds it all out in time, helps him when he is dying, after having treated him worse than the traditional dog while he was alive. He loses his life, however, in saving hers, something after the manner of "Banty Tim"; so that he deserves a reward; but, as the poor fellow very sensibly says, she would have been ashamed of him if he had lived, in spite of his devotion, the most sensible thing he could do was to die.

There is a great deal of folly bound up in Jane's promise to Henry Alison. As she had never loved him, and sincerely believed that he had asked her to marry him only because she was rich, one cannot see why she had engaged herself at all; or why, when she wanted her freedom, she did not take things with a high hand, and say in her vernacular:—"Now, you just look here. I don't feel like wanting to be married to you, and I shouldn't think you'd care to either when I didn't want to. I should think you'd be pretty glad to give me up right away if I asked you to." Instead of which, she has to go down on her knees and beseech Henry for her release, which at first she tries to buy by the offer of all her fortune. This is being lavish. An action for breach of promise would have left her at least something. But Henry Alison, in spite of his uncomfortable ways, does really love this cold, proud, disagreeable young woman; so he tears up the deed of gift, and flings the fragments on the floor; but when she kneels to him and cries, he gives way, and the two snarling lovers come to peace and harmony and the marriage service, as they desire. So end these two silly and uninteresting volumes, of which we cannot find one qualifying word of praise to say. The translation may be exact—we have not compared it with the original—but the style is lamentable; and with stilted language, unnatural characters, and a thoroughly unlikely story, we feel as if we had been looking at a toy forest made of painted tin and dyed calico, with wooden dolls set about to represent the human beings who live therein.

FRENCH LITERATURE.

NOTHING meets our view just now in publishers' shops but books in sumptuous bindings, evidently destined for Christmas presents, and whose glory is for the most part confined to the drawing-room table. Amongst these productions, however, there are some possessing real intrinsic merit, and not depending for their reputation upon morocco and gilt edges. Such is, for instance, M. Duruy's Roman History (1), the first volume of which is just out, and which was hardly completed when an illustrated reprint of it was begun. The present instalment, bringing us down to the end of the Second Punic War, is accompanied by eleven maps, and the pictorial illustrations are taken, not from fancy, but from the monuments of sculpture, architecture, and numismatics. The fourth volume of the large geographical work of M. Élisée Reclus (2) belongs to the same category of publications; it fully maintains the character of the previous instalments, and deals with England and the other countries of Northern Europe.

Under the title *Posthumes et Revenants* (3) M. Cuvillier-Fleury has recently published one of those collections of literary portraits which he gives us, we are sorry to say, at such long intervals. We have Mme. de Boufflers and Count de Sabran, Mme. Récamier and M. Ampère, Mme. Geoffrin and the King of Poland. Critics have often been reproached for their severity, but it is only just to remember that they have been not infrequently helped in their task by the indiscretions of those whom they had to judge. Take, as an instance, M. de Chateaubriand's *Mémoires d'outre Tombe*, or M. Mérimée's *Lettres à une inconnue.* Revelations of this kind are very damaging to the persons concerned; but at the same time they have the advantage of letting us know the truth. Mme. Geoffrin is one of the most interesting figures in M. Cuvillier-Fleury's gallery of portraits. Thanks to M. de Moüy, we know her a great deal better than we did ten years ago; but her entire correspondence has not yet been published, and when it is printed, as we hope it may be one day, it will be amusing to find the reputed friend of the philosophers, the hostess who entertained at her weekly dinner parties the whole staff of the *Encyclopédie*, cutting her guests to pieces in private, and speaking of Voltaire, D'Alembert, Diderot, and their friends with an amount of bitterness which Joseph de Maistre himself never surpassed. M. Cuvillier-Fleury's new volume is completed by two speeches delivered before the Académie Française on the occasion of the reception of MM. Autran and John Lemoinne.

The memoirs and letters of Cardinal de Bernis (4), edited by M. Frédéric Masson, will take by surprise those readers who were acquainted with the statesman's life and character only through the correspondence of Voltaire and Anquetil's History of France. No one would ever have suspected that there was in "Babet-la-Bouquetière" the stuff of a patriot, a diplomatist, and an honourable man; but M. Masson is of opinion that in the Cardinal's case calumny has hitherto had too much scope; and, as he asserts nothing which cannot be proved, we must confess that the world really knew nothing about Bernis before the publication of these two interesting volumes. If we may believe M. Masson, the whole French eighteenth century has been sadly misrepresented; legend has taken the place of history; and the time has come for a thorough revision of the indictment so elaborately made out against the reign of Louis XV. Persons who had hitherto undertaken the study of that period with the *à priori* intention of seeing in it nothing but the annals of corruption, materialism, and *mœurs faciles*, will find their theories completely upset; and an honest investigation of the memoirs and State papers belonging to the epoch extending from 1715 to 1776 will conclusively show that, together with a certain amount of vice which it would be absurd to deny, France could then boast of many instances of virtue, self-sacrifice, and fidelity to all the duties of social and domestic life. M. Masson's long and exhaustive preface explains the principal events related in the Cardinal's memoirs, and forms, so to say, a commentary on the work. We have, besides, a series of letters from the Abbé-Count de Bernis, an appendix of documents, and abundant help in the shape of notes, indices, &c. The responsible position which the editor, M. Frédéric Masson, holds as Librarian to the French Foreign Office, has enabled him to illustrate in the most curious manner an important epoch in the diplomatic history of the last century.

M. de Rochambeau had collected, annotated, and published for the Société de l'Histoire de France the correspondence of Jeanne

(1) *Histoire romaine.* Par V. Duruy. Edition illustrée. Vol. 1. Paris and London: L. Hachette & Co.

(2) *Géographie universelle.* Par E. Reclus. Vol. IV.—*Le Nord de l'Europe.* Paris and London: L. Hachette & Co.

(4) *Mémoires et lettres du cardinal de Bernis.* Publiées par F. Masson. Paris: Plon.

d'Albret and Antoine de Bourbon. Baron de Ruble, already known by his excellent edition of Blaise de Monluc, now undertakes to write the history of Jeanne d'Albret herself, and gives us, as a preliminary instalment, an account of her marriage (5). We need not say that the Princess was the daughter of Marguerite d'Angoulême, and therefore the niece of King Francis I., *le roi chevalier*, as he is popularly called. Documents respecting Marguerite abound; every circumstance in her life has been dragged to light, and the insinuations of the late M. Génin, unfounded as they seem to us, have given a somewhat undesirable reputation to the author of the *Heptameron*. In the case of her daughter, the ground is still new, and with the exception of a biographical notice in Messrs. Haag's *France Protestante* and two works written by M. Théodore Muret and Mrs. Freer, we had nothing worth mentioning in the way of authentic and trustworthy details. As Baron de Ruble remarks, everything is new both for the writer who attempts to relate the life of Jeanne d'Albret and for the reader who wishes to inquire into it; facts and documents alike are entirely and absolutely *inédits*. Even the date of the Princess d'Albret's first marriage was still a mystery; and the episode of her union with Antoine de Bourbon had never yet been accurately described. Some persons will perhaps be induced to find fault with the present volume for dealing too much with the anecdotal side of history. But matrimonial negotiations, as Baron de Ruble observes, always in the middle ages, and even during the sixteenth century, formed an important element in political complications; and, to quote only one instance, we see by Cardinal de Granville's State papers, and by Ribier's Memoirs, that dynastic ambition had as great a share in the quarrels between Francis I. and the Emperor Charles V. as the passion for conquest. Baron de Ruble's monograph is divided into four chapters, and substantiated by a goodly array of *pièces justificatives*. An engraved portrait of Jeanne d'Albret faces the title-page.

The fourth volume of Molière's works, published in Messrs. Hachette's "Grandes écrivains" (6), reminds us of the mutability of human affairs. Since this admirable collection was begun death has already removed a large number of the original editors. MM. de Monmerqué, Adolphe Régnier *fils*, and Despois, to name only these, are no more; and M. Mesnard, after having contributed the Racine, now finds himself entrusted with the care of editing the Molière, together with MM. Desfeuilles and Henri Régnier. The volume before us contains *Le mariage forcé*, *Les plaisirs de l'île enchanté*, *La princesse d'Elide*, and *Le Tartufe*. Besides Voltaire's summaries, the editors have added from contemporary sources all the documents which could illustrate the composition and performance of Molière's plays, and in the case of *Tartufe* it is curious to know the history of the efforts made at various times to prevent the success of that masterpiece. The grammatical notes are all that could be wished, and we may also notice the musical arrangement of Moron's songs in the *Princesse d'Elide*.

Molière is so closely connected with the Comédie Française that we find here a natural opportunity for mentioning M. René Delorme's interesting work (7). Foreigners are well acquainted with the museum of curiosities preserved at the theatre of the Rue Richelieu, which is constantly receiving fresh additions. But Frenchmen in general, and even Parisians, know next to nothing about it. Yet this collection boasts of portraits by Mignard, Largilière, David, Gros, and Gérard; with busts by Lemoyne, Houdon, Dantan, and David d'Angers. There are to be found most of Beaumarchais's MSS., Molière's own arm-chair, the bell which sounded for the massacre of the Huguenots on St. Bartholomew's day from the belfry of St.-Germain l'Auxerrois, &c., &c. All these curiosities are certainly worth a visit, and M. Delorme's *catalogue raisonné* will be an excellent guide for those who would wish to become acquainted with them.

M. Victor Pierre's second volume (8) completes his history of the Revolution of 1848. Louis Napoléon had been elected to the Presidency, and the new Republic was thus entering upon a fresh career; universal suffrage had transferred the power from the Assembly to a single individual, and, in spite of the fond illusions entertained by a few unpractical men, it was evident that the restoration of the Empire was only a question of time. M. Victor Pierre's narrative of the political events which gradually led to the *coup d'état* is clear and interesting; the only defect of the volume being the almost absolute want of notes and references. The account of the catastrophe of December 2 confirms amply what M. Victor Hugo and other eye-witnesses had already told us. M. Pierre explains very well, we think, the principal characteristics of the crisis which then took place. He shows that the moderate Republicans made a signal mistake when they allowed themselves to be identified with the Socialists; and he points out the curious fact of the Socialists recruiting their ranks, not chiefly, as before, from the population of the cities and large manufacturing countries, but from the peasants and agricultural labourers. This fact may be considered as having ruined for a time the cause of the Revolution. When it was seen that the rural districts, till then supposed to be inaccessible to Utopian doctrines, not only allowed themselves to be led astray, but even deliberately accepted the wildest schemes, it seemed indeed as if society was on the verge of destruction, and it is hardly surprising that the rule of the sword was enthusiastically welcomed. M. Victor Pierre dwells over and over again upon the shrewdness of Proudhon, whom he considers the most clear-sighted of all the innovators of the time.

M. Clovis Lamarre has treated a subject which, to French readers at any rate, is almost entirely unknown, and he has done so with a fulness leaving nothing to be wished for (9). In the first place, we have a biographical sketch of Camoens taken from the best authorities; a notice of *Os Lusiadas* comes next, supplemented by critical remarks on the subject of the poem, the composition, style, &c. The numerous allusions contained in the work could not be thoroughly understood without some knowledge of Portuguese history; the *Lusiads* indeed may be regarded as a kind of *Fasti Lusitanici*; and M. Lamarre accordingly furnishes us with a summary which will be found extremely useful. Finally, a prose translation, written upwards of fifty years ago, by M. Millié, and enriched with critical and literary notes, enables Frenchmen ignorant of the Portuguese language to appreciate, if not the style, at least the ideas, of Camoens.

We do not imagine that the uncomfortable views of pessimists will ever penetrate beyond the circle of intellectual society; but the existence of such a literary school is a fact worth studying, and we are glad that M. Caro (10) has devoted to it a series of brilliant and interesting sketches. Leopardi in Italy, Schopenhauer and Von Hartmann in Germany, may be regarded as the leaders of this strange sect. M. Caro examines them successively, and comes to the conclusion that the very extravagance of pessimism must prevent it from ever obtaining any popularity; its influence is essentially artificial, and mankind will not readily be satisfied with the hypothesis that existence is a curse, and that even science is a delusion and a snare.

M. Benoît Brunswik has contributed an excellent volume to the history of diplomacy by his commentary on the Treaty of Berlin (11). Geographical delimitations, international relations, political and financial problems, guarantees for the future, and temporary arrangements for the present—all these topics are discussed in a set of chapters written with evident care, and followed by the text of the treaties of Paris (1856), London (1871), San Stefano (1878), and Berlin (1878), together with the supplemental conventions resulting from these important documents.

The work of M. Alfred Michiels (12) on the Austrian Empire has reached a fourth edition, and we are not surprised at the success which it has met. Originally published in the journal *Le Siècle*, it is composed with the help of documents hitherto entirely uninvestigated, and which the Court of Vienna had done its best to keep under lock and key. Baron Hormayr, who presided for twenty-five years at the Imperial Record Office, openly acknowledged that the history of Austria, such as it was generally accepted towards the beginning of this century, consisted of nothing but a bundle of fictions written and compiled by the Jesuits. It is from the revelations given by him, from Cardinal Caraffa's *Germania sacra restaurata*, and from other sources equally trustworthy, that M. Michiels has drawn up his bill of indictment against the Government of Austria, which he considers as, even more than that of Russia, the representative of despotism, corruption, and cruelty.

The spirit which has dictated M. Jean Wallon's new work (13) is to be found in the following sentence:—"*Libéral* et *Athée* sont deux mots que l'on s'efforce de rendre synonymes." If our author hates Jesuitism, it is because he is attached to Christianity; and he has no difficulty in demonstrating that our modern Liberals, when they attempt to solve the religious problem of the day, signally fail because their fanaticism is equalled only by their ignorance. M. Wallon is equally suspected by free-thinkers and by Ultramontanists; he nevertheless persists, as M. Reveillaud does, in separating the cause of religion from that of the Jesuits; and he tells the advanced Liberals that they are much mistaken if they suppose that atheism is the only sound substratum for Republican institutions. His volume is all the more valuable as it contains no trace of the violence and exaggeration which unfortunately damaged the arguments put forward thirty years ago by MM. Michelet, Quinet, and Génin.

The important work composed by the late M. de Loménie (14) is not entirely new, as the readers of the *Correspondant* can bear witness; but one-third of it now appears for the first time, and we have thus another noteworthy addition to the curious studies of the French eighteenth century given by M. Frédéric Masson (*Le Cardinal de Bernis*), and the Duke de Broglie (*Le Secret du Roi*). Whilst collecting, during the space of twenty years, the materials for the present monograph, M. de Loménie enjoyed the advantage of intimate acquaintance with Mirabeau's adopted son, M. Lucas de Montigny. This gentleman, it is well known, naturally anxious to justify the great orator from the

accusations directed against him and to rehabilitate his memory, had composed a work entitled *Mémoires de Mirabeau*, although the designation was not strictly accurate. At the same time, he freely communicated to M. de Loménie all the documents he possessed, with full permission to make of them whatever use he deemed best; and the result is now before us in the shape of two octavos containing a history, not only of Mirabeau, but of *the Mirabeaus*. Indeed it would be more correct to say that the celebrated politician occupies in the present work a merely incidental place, his life being destined to form the subject of two further volumes, the materials of which have been left by M. de Loménie. As the author of the *avant-propos* justly remarks, the history of the Mirabeau family surpasses by its stormy and scandalous character all that can be imagined, and the great difficulty in dealing with it was to avoid the temptation of dragging into publicity circumstances which ought to be buried in oblivion. M. de Loménie has been successful in this respect; he maintains throughout his narrative the dignity of an historian, and if the public has been invited to feed upon scandal in the case of a family which the great orator himself designated as *la famille d'Atrée et de Thyeste*, it is mainly due to the indiscretion of the Marquis and Marchioness de Mirabeau.

The sketches published by M. Henri Houssaye (15) treat of antiquity and modern times; and the circumstance of their having been written in the places of which he speaks increases their value and adds much to their interest. Without aiming at scientific treatment or at archæological minuteness, M. Houssaye shows a real knowledge of classical antiquity when he examines the social condition of women at Athens, the state of the Roman provinces under the Empire, and the characters of Augustus, Tiberius, and Nero. The account of the first siege of Paris, B.C. 52, excited much attention when it was published separately in the form of a pamphlet, and a competent judge, M. de Saulcy, drew to it the attention of the Académie des Inscriptions et Belles-lettres, as being a sketch "full of erudition and of interest." Readers fond of contrasts will be amused by the article on the Parisian ladies of the last century, if they turn to it immediately after seeing what M. Henri Houssaye has to tell us about the heroines of Aristophanes, Lysistrata, and Praxagora. The decay of French dramatic literature and the invasion of the stage by the authors of ignoble buffooneries form the subject of a few eloquent pages.

Bernadille's second series of *Croquis parisiens* (16) equals the former one in point of variety and of *entrain*. The *feuilletons* are thirty-six in number. They reproduce some of the incidents which, from the 4th of January, 1876, to the 26th of March, 1878, have occupied the curiosity of the *badaud*-world; and there is abundant good sense, taste, and clever satire in this amusing and unpretending little volume. Bernadille is every inch a journalist; he thoroughly knows the *argot* of journalism; and we can well imagine that, if La Bruyère could once more visit Paris and saunter along the boulevards, note-book in hand, he would write much as Bernadille does. One of the most amusing chapters is devoted to the sayings of a French Mrs. Malaprop, whose medicine-chest contains *ordure* of potassium, *surface* of magnesia, and salt of *mitre*. The supposed *discours de réception* of M. Émile Zola at the Académie Française, made up of expressions taken from the *Assommoir*, is a good illustration of what we suppose is to be the literature of the future; and the *Lettre de l'Archéologue Perrichon* will be pronounced scandalous by Dr. Schliemann's admirers.

M. Léon Rousset discourses about China (17) with the accuracy of a man who well knows the country, the inhabitants, the laws, and the institutions. He regrets that his fellow-citizens are so careless about their political standing in the far East; and that, through their apathy, they should consent to re-echo merely what England, America, and Russia are pleased to decide about the Celestial Empire. Two centuries ago French influence was all-powerful in China; now it has almost entirely vanished, and M. Rousset's object in composing his entertaining volume, after seven years' residence abroad, is chiefly to prove the necessity of recovering that influence and to explain the best way of doing so.

Thanks to the artistic perfection of the Chiswick press, M. Glady, the London publisher, challenges comparison with MM. Lemerre, Techener, and Plon, for the beauty of his editions. A few months ago we had to notice his elegant reprint of *Manon Lescaut*; he now presents us with a delightful little volume containing Amyot's well-known translation of Daphnis and Chloe (18). As an additional attraction, M. Glady has obtained from M. Alexandre Dumas a preface, in which the author of *La Dame aux Camélias* cleverly reproduces the style of the sixteenth-century French.

MR. FORSTER AT BRADFORD.

MR. FORSTER'S speech at Bradford was divided into two parts, of which it may be said without disrespect that the former was the more important. In addressing his constituents on the foreign policy of the Government he could not have said anything new; and it may be added that, like other members of the same party, he omitted to answer the arguments by which the Afghan war has been defended. There is no reason to suppose that the AMEER could have been detached from the Russian alliance by any means short of the employment of force; and Mr. FORSTER'S colleagues and political allies have on many occasions confessed that it was impossible to acquiesce in the substitution of Russian for English influence at Cabul. It was scarcely consistent with Mr. FORSTER'S usual fairness to found an argument on Lord BEACONSFIELD'S admission that the Russians were morally justified in disregarding, at a time when war was imminent, their undertaking to abstain from interference in Afghanistan. Whether Lord BEACONSFIELD was right or wrong, he assumed that the despatch of the Russian Mission to Cabul was a hostile measure, only to be excused as a preparation for a rupture with England. The AMEER was therefore, in the opinion of Lord BEACONSFIELD, and for the present purpose according to Mr. FORSTER'S contention, a party to a proceeding which was all but an act of war. As the Mission remained after the signature of the Treaty of Berlin, the Indian Government could not but remonstrate in peremptory terms against the unfriendly conduct of SHERE ALI. The repulse of the English Mission at Ali Masjid amounted to a refusal either to give satisfaction or to negotiate; and it only remained to enforce the attention of a contumacious neighbour. Fresh evidence has lately been furnished of the real cause of the AMEER'S alienation. He entertained the most friendly feeling to the English Government for some time after the Conference of Umballa, but he deeply resented the answer to his proposals in 1873, though Lord NORTHBROOK had verbally exceeded the Duke of ARGYLL'S instructions, which amounted to an absolute refusal. From that time SHERE ALI'S relations with the Russian Governor of Turkestan became more and more intimate; and he was fully aware that in his case friendship with Russia involved enmity to England. There is of course another mode of reciting and interpreting the transactions which have resulted in the Afghan war; and Mr. FORSTER is content to argue the case as an advocate bent on making the strongest possible case against the Government.

A much more urgent question than any inquiry into the past policy of Secretaries of State and Viceroys could not perhaps have been raised with advantage at a meeting of the Liberal party at Bradford. The war has, as in all similar cases, superseded in practical importance the merits of the quarrel which produced it. There is no doubt that it is the right and duty of the Indian Government to make the most of any military advantages which may be obtained. The expediency of different provisions for future security must be determined almost wholly by professional considerations; and at present three or more distinct courses are severally recommended on high military authority. Sir HENRY NORMAN thinks it will be desirable to remain content with the former frontier on the right bank of the Indus, opposite to the eastern outlets of the mountain passes. General HAMLEY attaches great importance to the retention of the Bolan Pass and of Quetta, and he proposes also to keep Candahar, which may perhaps in a few days be occupied by General STEWART. Another eminent writer agrees with General HAMLEY as to the advantage of holding Candahar if at any future time it should be necessary to engage in direct conflict with Russia. In the meantime he regards the power of advancing beyond the passes as a sufficient security for the observance by the rulers of Afghanistan of reasonable terms of peace. All the military writers unanimously deprecate the retention of Jellalabad, which would involve a permanent liability to protect the Khyber Pass. According to one authority, it would be an error to advance simultaneously from the Khyber and from Candahar against Cabul; but the Indian Government will have to provide the most defensible frontier long after the present campaign is concluded. It is not yet known whether General ROBERTS has really announced to the tribes in the Kuram district the annexation of their territory to the Indian Empire. It seems premature and unnecessary to pledge the Government to any alteration of the frontier before the conclusion of the war. That peace may be concluded on the earliest possible opportunity is the wish of all reasonable persons, whether or not they belong to either of the regular political parties. There is no reason to suppose that the Ministers in any respect dissent from the general feeling and opinion. It is their interest to retire from the struggle at a time when the success of their operations is complete and undisputed. Their opponents will after the conclusion of peace be reduced to assert, what cannot be proved, that English supremacy in Afghanistan might have been established or retained without expense or risk.

The foreign policy of the Government both in India and in Europe, though it may be defended by forcible arguments, has undoubtedly furnished the Opposition with opportunities of denunciation. The extraordinary vehemence of party feeling has, amongst other effects, directed attention to the next election; and it has facilitated the progress of the organization which had previously been established at Birmingham. In the fable, factious animosity against the stag was at the highest when the horse invoked against his adversary the aid of man, to whom his race has ever since been subject. The Liberals were thoroughly beaten five years ago; they hope to retrieve their defeat upon the next dissolution; and they have worked themselves up to the belief that the Conservative Ministers have committed flagrant political misdemeanours. It is not surprising that schemes for creating and establishing the permanent supremacy of the Liberal party should find much acceptance. Mr. CHAMBERLAIN'S ingenious method of packing political and municipal elections has attracted both attention and imitation. Zealous Liberals who think that they see their way to a monopoly of place and power have no leisure to inquire whether the new machinery is consistent with the spirit of representative institutions; yet the introduction of a system of secondary or indirect elections is a novelty which, if it had been enacted by Parliament, would have provoked general remonstrance. It is fortunate that the factious intolerance which the Birmingham plan is calculated to encourage found early vent in an attack on the independence of one of the most highly respected leaders of the Liberal party. Mr. FORSTER some time since rejected the insolent demand that he should make his candidature at Bradford

contingent on the nomination of the Liberal Club of Three Hundred or Four Hundred. The temptation of an almost definite promise that he should be selected by the managers failed to overcome his repugnance to a condition which was intended both to confirm the authority of the Club and to inflict a rebuke on Mr. FORSTER for a former display of public spirit which was distasteful to a section of his supporters.

The satisfaction caused by Mr. FORSTER's manly conduct was in some degree tempered by his apparent reliance on a casual argument which left the merits of the question untouched. Mr. FORSTER contended that, as an actual member, he had a right to become a candidate without the sanction of any section of his constituents. It might therefore have been supposed that he recognized the right of Mr. ILLINGWORTH and his associates to control the candidature of any new comer. In his late speech Mr. FORSTER took higher ground. His repudiation of the pretensions of the Liberal Club applies to every constituency and to every candidate. As he clearly showed, the organization imported into Birmingham from America substitutes for the electors at large a body which may or may not represent their opinions. The Three Hundred are chosen by those who happen to take part in an unauthorized and irregular election. It is nothing to the purpose to say that any Liberal may, if he thinks fit, concur in an act of which he may perhaps disapprove, and which he is not legally or constitutionally bound to perform. Those who abstain on principle, or for any reason, from the preliminary election are injured by the usurped power of nomination of candidates. Even if the American contrivance were established by law, it would conflict with the spirit of the Constitution. It may well happen that a constituency differs in its estimate of the qualifications of a candidate from its own delegates, who nevertheless claim an absolute right of returning a member if their party is in a majority. As Mr. FORSTER said, the Committee of the Club would exercise nearly the same control over a member which formerly belonged to the owner of a nomination borough. He would feel himself bound either to concur with his patrons or to resign his seat. Mr. ILLINGWORTH's letters sufficiently illustrate the tone and temper in which local manipulators of elections would address recalcitrant nominees. There is fortunately no reason for doubting that the Liberal electors of Bradford will vote for Mr. FORSTER, and when their purpose is ascertained, the baffled managers will find some excuse for acquiescing in the decision of the party. The ridiculous collapse of the Peterborough Club threw wholesome ridicule on a vicious system which is exposed to serious disapproval in Mr. FORSTER's speech. It is his misfortune to differ from Mr. GLADSTONE on the expediency of sacrificing all other considerations to the triumph of faction.

ESPARTERO.

ESPARTERO has died in extreme old age, and in the enjoyment of peace and honour. For many years he had remained in a voluntary retreat; but visits of respect have been paid to him from time to time by all that is most illustrious in Spain; and his countrymen could never lose the wonder and admiration awakened by the thought that, at Logrono, there really was a Spanish General who had done more good than harm to his country. ESPARTERO belonged to the age of military adventurers. He rose and he fell as they did; but he was abler, more successful, and more honest than his rivals. It is easy to remember the issue of the first Carlist war, and to forget how this issue was brought about. The Carlists were reduced to sign the Convention of Bergara, and that is a simple fact easy to bear in mind. The strength of the Carlists, the weakness of the QUEEN's forces, the skill and courage with which ESPARTERO managed to beat a good army with a bad one, and even the large share which English co-operation had in his success are almost forgotten by this generation. Spanish politics and Spanish civil wars form the most dreary and the most confusing chapter in modern European history, and the ordinary reader turns away from its perusal in despair. So far, however, as it has any interest or attraction, its best features are connected with the career of ESPARTERO. He was so far unlike other Spanish generals of his time that when he commanded in person he always won and that he stood aloof from Palace intrigues. Englishmen, too, will think it to his credit that he retained without wavering or change a persistent admiration and affection for England. He afforded the rare example of a Spaniard who felt grateful to Englishmen for helping his country in its hour of need. His sympathy with the institutions of England was too far in advance of his generation for his own prosperity, and he was driven from power because he was too liberal, and was suspected, perhaps not without reason, of the dark design of extending the foreign trade of Spain. When banished he made England his home; and it was while he was thus safe and powerless that the unhappy marriages were concocted which sacrificed the happiness of a woman and the peace of a nation to the petty triumphs and treacherous manœuvring of the French Court. Had ESPARTERO been in Spain and in a position to be consulted in 1846, he might have been unable, and possibly might have been unwilling, to carry the candidate favoured by Lord PALMERSTON; but he certainly would have striven hard to prevent the Sovereign from being the victim of a bargain which in the eyes of a soldier and a man of honour would have seemed inexpressibly revolting. After his return he was on more than one occasion appealed to by the QUEEN for his advice and assistance, and as he grew older, the memory of his ancient deeds was encircled with a brighter halo, his name was invested with the charm of long abstention from current politics, and when the throne became vacant, there was even a proposal made that he should mount it. The proposal was so remote from the regions of common sense, that it can only have been regarded as a testimonial to his merits. It was a sort of cumbrous mode of giving him the Garter. ESPARTERO himself was only anxious to see Spain get something like a settled Government before he died. He welcomed the Italian PRINCE who was willing to consecrate the best resolutions and many noble qualities to the performance of an ungrateful and perhaps impossible task; and he lived to see another Carlist war surmounted, and the son of the Sovereign whose throne he had once established, reigning over a tranquil and tolerably united country.

The origin of ESPARTERO was humble. He was the son of a wheelwright of La Mancha, and was being educated for the priesthood when the opening of the war against NAPOLEON called him, as it did all the youths of spirit in the country, to arms. The war, however, was finished before he had completed his preliminary studies; but he had conceived so strong a liking for his calling that he applied for permission to serve with the forces sent out to subdue the revolted dependencies of Venezuela and New Granada. There he distinguished himself by reckless personal courage and by never despairing of success even when success seemed most hopeless. At length the Spaniards had to evacuate the country, and ESPARTERO came home to receive the rewards of incontestable services. He was acting as Governor of Palma when FERDINAND died, and he immediately tendered his sword to the acceptance of FERDINAND's widow and daughter. He was sent to Biscay, and took a part as a subordinate General in the Carlist war until in 1830 he was made Commander-in-Chief of the army of the North. The relief of Bilbao and the capture of Hernani, with the assistance of Sir DE LACY EVANS, broke for the first time the power of the Carlists, and when they determined to change the scene of operations, and had at one time got within a very few miles of Madrid, the prompt arrival and the skilful strategy of ESPARTERO drove the enemy once more in confused flight towards the North. But the struggle was not over. Mountain warfare, when the combatants have no great inequality of resources or valour, lasts a long time, and it needed a series of operations—some brilliant, some depending on skill—before ESPARTERO, three years after he had become Commander-in-Chief, brought the war to a close at Bergara. All the honours that the prodigal ingenuity of Spaniards could devise were lavished on him. But he was launched, or chose to launch himself, on the usual career of a Spanish General. He became the hero of a pronunciamento and at the head of an irresistible army drove Queen CHRISTINA out of the country and was in due course proclaimed by an obedient Cortes sole Regent of the kingdom. He succeeded in putting down two of the inevitable revolu-

tions that beset this sort of career, but succumbed to the third, and had to fly to England for refuge. In 1848 he was recalled; but he was so heartily welcomed by the populace of Madrid that his friends feared that his enemies would find a pretext for arresting him, and he retired for seven years to his home at Logrono. From his retreat he once more emerged and associated himself with O'Donnell in the government of the country. But he was no match for the intrigues of his confederate, and so far as he had any consistent political ideas, his views were too liberal both for the Court and for the nation. In 1856 he retired permanently and lived for nearly a quarter of a century in honourable obscurity. No one would think of calling him a great man, but both in his achievements and in his character he sufficiently surpassed his contemporaries to be deservedly eminent. Nor did he ever lose his popularity. His countrymen are only too glad to recognize a national hero if they can find one, and it was something for the Spaniards of the days of Queen Isabella to find one Spaniard of whom they could be reasonably proud.

Espartero was nothing more than a Spanish general and a Spanish politician, although his generalship was better and his politics were no worse than those of the other generals and politicians of his time. He had no more scruple in using his army to get himself into power than was felt by the rest of his class; but it may be fairly said that his aims were not so exclusively selfish as those of most of his rivals. It may be added that as he got older he got wiser and better. He would have nothing to do with the insurrection which broke out in his honour when he was driven from power by O'Donnell. He had nothing to do with the downfall of Isabella, and he was quite ready to give his support to any Government that promised to be able to replace effectually that which had been superseded. He lived in the era of pronunciamentos, but he also outlived it. These revolts of generals were probably inevitable in such societies as those of Spain and her colonies, and Spanish colonies may be now divided into those which have got tired of military revolutions, and those which have been ruined by them. Spain itself is thoroughly sick of them; but it is sick of them because in spite of them it has so far advanced in wealth, coherence, and moderation that it has taught itself to wish for something better. The present state of things in Spain leaves much to be desired, but it presents the most wonderful contrast to the Spain which Espartero found when he returned from the New World. It is like a different country. The successive Ministers of Queen Isabella were in many respects very worthless people, but somehow the country throve under them. Roads were not only made but guarded, and railways did much to unite provinces that had been separated for ages. The country has since then had many experiments in Government, and has come to the conclusion that the Government of Alfonso is as good as it can get, and, perhaps, as good as it wishes for. It may be more reactionary and clerical than would be acceptable in more advanced countries; but it is not tyrannical or aggressive, and the nation is able to develop under it the great national resources of Spain with a fair amount of security for its present and hope for its future. If Espartero, in his old age, asked himself whether such a result was worth working for he may have honestly answered that it was. No one person had done so much to render it possible as he had, for unless he had put down the Carlists when no one else could manage to beat them, Spain would have been utterly wasted with an interminable civil war. He probably saw something around him very different from the ideal which he had set before him when he first set to work to shape the history of Spain; but, at any rate, the present is so much better than the past, that he could not persuade himself that he had laboured in vain.

TURKISH REFORMS.

Lord Salisbury has been blamed, with a bitterness to which he must by this time have become accustomed, both for the projects of reform which he urged upon the attention of the Porte and for his provisional acceptance of the instalment of concession which the Turkish Ministers offer in reply. If he had asked for less, and had insisted on any demand which he had preferred, a prejudiced and unfriendly critic would perhaps have denounced his despatches as at the same time incomplete and peremptory. No prudent Minister, it might have been said, would have expected an independent and jealous Government servilely to submit to his dictation. It would therefore have been wiser to propose a comprehensive scheme of reform, and at the same time to foresee that it would not be adopted in bulk. Lord Salisbury has, with one exception, not withdrawn any part of the advice which he had a right by treaty, as well as in virtue of better knowledge and civilized experience, to tender to the Sultan. On the recommendation of Sir Henry Layard, he has acknowledged that the Turkish proposal of employing European inspectors of tribunals is better than his own plan of appointing European judges of appeal. He still thinks, with good reason, that European officers ought to hold commands in the new police; but he assents to a compromise by which Europeans are for the present only to aid in the organization of the force. The gradual introduction of fixed revenue settlements, in place of tithes let to contractors, is a recognition of the soundness of Lord Salisbury's principle. It is unlikely that a statesman who has much experience of Turkish procedure should have been surprised or disappointed either by some delay in answering his despatch, or by the rejection or postponement of some of his proposals.

Although Lord Salisbury's instructions were communicated by the Ambassador to the Grand Vizier in perfectly courteous and inoffensive language, it seemed more than probable that an unfavourable answer would be returned. The Turkish official class habitually dislikes foreign interference, unless indeed it assumes an indirect and sometimes a personally profitable form. For many years the representatives of England have met with resistance and ill-will in their efforts to preserve Turkish rule by improving the administration. The influence of a rival Power was systematically exerted for the opposite purpose of maintaining abuses and encouraging misgovernment. It would seem that the policy of General Ignatieff is not abandoned at Constantinople. Sir H. Layard reports that a strong party in the Ministry and the country looked upon Lord Salisbury's recommendations as a violation of the sovereign rights of the Sultan and the independence of Turkey; and he adds that he has reason to believe that foreign influence has been employed very energetically, and not without some effect, to encourage and support this opposition. At one time a majority of the Council of Ministers agreed to return an answer which would have been wholly unsatisfactory; but the Sultan and Safvet Pasha, then Grand Vizier, were sincerely desirous to comply with the recommendations of the English Government. It would seem that the Sultan has the good sense to listen to the counsels of Sir H. Layard, whose energy has, during a long and difficult series of negotiations, never for a moment relaxed. In the able and faithful discharge of his duty to his own Government the Ambassador has always, to the utmost of his power, promoted the welfare of Turkey. It appears that the Sultan, and perhaps some of his Ministers, have at last discovered that a friend is a safer counsellor than an enemy.

The answer which had been at first approved was remitted to the Council for reconsideration, and the final draft expresses the readiness of the Sultan to follow to a great extent Lord Salisbury's advice. Rules for the organization and government of the police force have been compiled on the advice of Baker Pasha, who seems to concur in Sir H. Layard's opinion that the appointment of foreign officers might at present raise difficulties which are likely to be hereafter overcome. The new revenue system is at once to be applied to one province in the north of Asia Minor; the tenure of office of local governors is to be fixed at a period of five years, and preparations have been made for the establishment of the new judicial system. It is not improbable that delays will occur in the execution of the Sultan's decrees. Changes in Turkey are always slow and difficult; and the Government is unable to raise money for the most necessary purposes. The menacing attitude of the Russian army since the conclusion of peace has rendered costly armaments indispensable, and the abortive revolution which is now suppressed in Macedonia has caused great expense. Sir H. Layard admits the validity of the plea of insufficient means; and he attaches just importance to the establishment of sound principles even when reforms in administration are likely to be fragmentary and slow. It is highly

unreasonable to blame Lord SALISBURY for his assent to a compromise which is in its nature only temporary. If he remains in office, he will not fail on all convenient occasions to renew and enforce his original demands. It would not have been expedient by a more exacting tone to have offended the Turkish Ministers and to have alienated the SULTAN. To a master of the literary style which befits diplomacy no task could be easier than to compose a logical demonstration of the right of England to insist on administrative reforms in Turkey. The Convention which at the same time imposed greater reciprocal burdens on England conferred ample right of interference in domestic concerns; but, as the interest of the SULTAN happens to coincide with the discharge of the liabilities which he has undertaken, an appeal to his good sense and patriotism is likely to be more persuasive than a formal demand of the performance of his promises. It is possible that when Lord SALISBURY was Plenipotentiary at Constantinople two years ago he might with advantage have disguised feelings, in themselves natural, of contempt and moral indignation. Nothing in his late despatches justifies similar imputations.

Turkish Administrations are so ephemeral that it is impossible to rely on the qualities of those who are temporarily invested with power. The present Cabinet seems to have been chosen by the SULTAN with due regard to ability and honesty. KAIREDDIN PASHA, now Grand Vizier, is in some sense a stranger, as he is an Arab from Tunis, and he is said, in common with some of his colleagues, to possess literary ability. One of his works is devoted to proof of the proposition that Mahometanism is the most liberal of religions. Whether or not the doctrine is orthodox, it may be conjectured that the author will be disposed to furnish evidence in support of his own theory. The other Ministers appear to enjoy a good reputation, and some of them are known to be capable. A more important event than the change of Ministers is the dismissal and exile of the palace favourite, who since the beginning of the present reign has exercised a deleterious influence over the SULTAN. MAHMOUD DAMAD was believed to be largely responsible for the disasters of the war, nor has he enjoyed a reputation for loyalty, although he contrived to convince the SULTAN of his personal devotion. For a country in the state of civilization of Turkey a vigorous despotism is perhaps the only efficient form of government; but a timid ruler easily learns to separate his own personal security from the interest of the State. It is not surprising that the present SULTAN, who ascended the throne after two rapid dynastic changes, should constantly apprehend conspiracies which are perhaps not always imaginary. In other respects he seems personally superior to his immediate predecessors. Sir H. LAYARD frequently in his correspondence attributes judicious measures to the personal intervention of the sovereign. Neither the Turkish Government nor its advisers have thought of renewing the singular experiment of representative institutions, although the short-lived Parliament displayed unexpected independence and spirit in the form of remonstrance against administrative abuses. In his first despatch Lord SALISBURY asserts that government by elected Assemblies is impracticable in Asiatic Turkey. It may at least be said that, if the Porte proceeds to introduce the proposed reforms, it is better that the action of the Government should not be impeded by an Opposition. Able and honest governors will succeed better when they have nothing to do with parties. It happens that MIDHAT PASHA, who instituted the first Turkish Parliament, now governs one of the most important provinces of the Empire. If he is duly supported by the Government of Constantinople, he will probably exhibit in his new post the same qualities by which he gained distinction at Bagdad and on the Danube.

BANKING.

THE failure of a private bank so long established and so highly respected as that of Messrs. TWEEDY of Truro has caused great local distress and may bring ruin to many honest and innocent persons, but it has not aggravated or revived the panic in the banking world. The failure was no sooner announced than its causes were understood. The bank had been in existence for more than a century; it had a small note issue, its notes were hoarded as if they had been coin, and the partners were highly esteemed in their neighbourhood. Such an institution rests on a solid foundation, for it enjoys an ancestral credit. But when attention is drawn at an unfavourable moment to the actual position of such a bank, its credit may be shaken with startling rapidity. However long a bank may have lasted, and however much its proprietors may be respected, its real strength must in the moment of trial depend on its amount of available capital, and on the nature of its operations. Very little is really known as to the amount of capital which a private bank can command. It gives no information on the subject, and the amount is therefore a matter of estimate or gossip. One of the partners in the Truro Bank lately died, and his executrix asked that his share in the partnership funds should be paid over to her. This set the Cornish world calculating how much capital would remain in the concern, and as the deceased partner had been reported to have made some unprofitable investments, the further question began to suggest itself whether even their recourse against his private estate would do the creditors much good. Then, again, the partners in a private bank are under the temptation to do business in a rather easy way. Their neighbours respect and esteem them, and address them as personal friends and as known friends of the district. They give back kindness for kindness, and do not frown when applications for advances are made. Messrs. TWEEDY's bank was, it is stated, known as being peculiarly the bank of overdrawn accounts. Then Truro is the centre of a mining district, and to support the district Messrs. TWEEDY had to support mines. At present Cornish mining is in a very low state, and its prospects are specially bad. The coal and iron trades of England may revive any day if the world once more wants our coal and iron; but the Cornish mining industry is depressed from a cause which cannot easily cease to operate. Copper and tin can be found much nearer the surface in the new mines of other countries than in the old mines of Cornwall; and the difference in the cost of labour eclipses the additional cost of freight. The money, therefore, lent to the neighbouring mines by Messrs. TWEEDY was looked on as lost, and there was a notion prevalent that their general style of banking had been too easy. Local confidence had made them prosperous, and local suspicion caused their downfall.

It is for this reason that, deeply as the depositors and customers and noteholders of this bank are to be pitied, its failure has not produced any great impression on the public. A private bank that conducts its business on the principles of neighbourly feeling, and the capital of which is determined by family events, seems too special a case to cause general alarm. What is important to know is, whether there has been much bad banking generally; and, still more, whether the state of trade is such that even well-conducted banks are in danger. On the first head it is as yet too early to speak. We must wait to see how, not only our home, but our distant banking business has been conducted. But on the second head there is much that is reassuring. To begin with, it must be borne in mind that as yet no bank has failed in which there has not been distinctly bad banking brought to light, although in the case of the Caledonian the bad banking consisted in one solitary act of imprudence. Then, again, it is ascertained that at least some well-conducted banks are in a very strong position. Every day some well-known bank declares a dividend at its usual rate. This does not show much, for every one knows that dividends may be paid without real profits, and when capital has been lost. But it shows something, for it is not probable that any great number of Boards would run the risk of making delusive statements at a moment when the responsibility of Directors for making such statements has been forced on the attention of every one. In some instances we know in detail how sound banks have been conducted. The report of the Union Bank of London furnishes a conspicuous example. It has in round numbers a capital, including the reserve fund, of two millions; it owes twelve millions to its customers and depositors, and it has given acceptances to the amount of nearly five millions. On the other hand, while it has lent seven millions to customers, it has seven millions in cash and Government securities, and holds upwards of eight millions of special securities as cover for its acceptances. Its business in acceptances is unusually large in proportion to the other business, and no part of banking business requires so much vigilance. But, with vigilance and with a large

reserve in cash, it may be conducted, as the Chairman of the Union said it had been conducted by his bank for many years, with much profit and with no loss. As to bad debts, the Chairman was able to make the very satisfactory statement that they did not amount to 300*l.* for the half-year. This is most creditable to all who have managed the institution, and it may be comforting to the public. After all allowance is made for the Union having the pick of business, this absence of bad debts may be held to be confirmatory of the opinion, which every day grows more and more established, that there is plenty of sound business in the country, and that trade generally is by no means in a desperate state.

Changes in our system of banking, legislative or other, cannot at present fail to occupy the attention of the numerous classes concerned. Whether unlimited banks should become limited is the most important of these changes, and here there is no need of the intervention of the Legislature. The Chairman of the Union observed that, with the strong position of their bank, he thought the question did not much concern the shareholders whom he was addressing. Nor perhaps would it if good management was perpetual; but the memory of the Union shareholders may suggest that there has been an improvement, and their fears may suggest that there may be a relapse. The Chairman, however, added that, if other banks on an equality with the Union would adopt limitation at the same time, he and his colleagues would recommend the Union to concur. This is very sensible. It cannot be expected that a bank so well protected as the Union against the dangers of unlimited liability should consent to see its business taken away from it by rivals. The sound Scotch banks are in a similar position, and they must all act together if at all. In the same way the Chairman said that he had not the slightest objection to an extended system of audit and compulsory frequency of returns, as long as it was made incumbent on all banks to observe the same rule. It may be very much doubted whether the Government will introduce any change in this direction. It would be equally difficult to include or to omit private banks when the details of the change were considered, and it is not easy to see how to make any change which would ensure publicity and yet avoid hampering the conduct of business. The Government, however, appears to have determined to make some proposals with regard to banking. Mr. CROSS, during his stay at Edinburgh, intimated that something would be done to relieve trustees from the anxiety of their position. A new problem has also risen through the action of the liquidators of the City of Glasgow Bank in regard to bankruptcy. They claim that, if a shareholder is made a bankrupt, they may prove for any amount that in a conceivable case the shareholder, if the only shareholder remaining solvent, would have to pay. This is no doubt theoretically the limit of his liability; but the consequence is that this sweeping claim wipes out all the other creditors of the bankrupt from anything more than a fractional share in the assets, so that a creditor may lose all his money because his debtor held a single share in a bank. The hardship on the creditor is at least as great as the hardship of which trustees complain, and Mr. CROSS may be reasonably expected to extend his tender consideration in favour of the former class of sufferers as much as in favour of the latter.

TRADE DISPUTES AND STRIKES.

THE unhappy condition of the country seems likely to be aggravated by additional misfortunes. It is one of the evils attending on trade disputes that they are never more frequent than in seasons of commercial depression. Employers who find that their capital becomes more and more unproductive naturally seek to reduce their working expenses; and workmen almost always resent, and frequently resist, attempts to make them share the losses of trade. A few years ago wages in some branches of industry rose to an unprecedented level; and at the same time the hours of labour were in many instances curtailed. Experience showed that the efficiency of labour too often varied inversely with the rate of wages; and the predictions of philanthropic theorists that short hours would find compensation in increased energy and activity were wholly falsified by the result. To the manufacturers the abbreviation of the time of work was much more distasteful than the rise in wages. Engines which need no rest are necessarily stopped when the men leave their work, and the interest of the capital invested in plant remains the same when the works are idle. There is no more remarkable proof of the superiority of English labour than the maintenance of competition with foreign countries under extraordinary disadvantages. An English employer sometimes pays larger weekly wages for fifty-four hours' work than his German rival for seventy-two; but as the skill and capital of foreign producers increase, the struggle becomes more and more unequal. English travellers in Germany, in Switzerland, and in Italy have of late not unfrequently inquired in vain for English commodities which were formerly sold at every shop, and which have been displaced by cheaper fabrics.

The strike of the men employed in the goods traffic of the Midland Railway will attract general attention, both by reason of its importance and through the public inconvenience which it will cause, especially if the signalmen should take part in it. There can be little doubt that the measures which have led to the strike have been concerted with other Railway Boards; and it is therefore possible that the struggle may attain vast dimensions. It was on the Midland that a great capitalist induced the men employed to demand higher wages and a reduction of the hours of labour. Mr. BASS has again interfered on behalf of the men in the present dispute. As the Chairman of the Midland Company reminds him, the member for a borough in which railway servants form a large section of the constituency is scarcely an impartial arbitrator. Mr. BASS would perhaps object to the intervention of a volunteer in any dispute between his firm and the large number of persons in their employment. In his former effort to promote the interest of his constituents Mr. BASS was partially successful. In a time of unusual prosperity the agitation could not be resisted, and the change extended over all parts of the kingdom. At the same time coal and iron reached their highest price, and the additional burden of working expenses absorbed the whole of the profit which would otherwise have been derived from increased traffic. If the cost of working had remained stationary during the last ten or twelve years, several of the principal Companies would have earned dividends of eight, or even ten, per cent. Although both coal and iron are now extraordinarily cheap, the item of wages alone causes the working expenses to exceed the former ratio to earnings by four or five per cent. In this business, as in other trades, short hours are found more injurious to the employers than high wages. The Midland Directors have, probably after full consideration, given notice to the men engaged in goods traffic of a reduction of wages by a shilling a week, and of an increase in the number of hours. The men, after an interview with the Chairman, have thus far refused to acquiesce in the change; yet there is some reason to expect an early termination of the struggle. The labour of railway guards is not highly skilled; and it is therefore possible to supply in some degree the place of experienced men who have thought fit to leave their employment. When the strike began great numbers of trucks were accumulated on the line and on the sidings, and it must have been difficult to conduct even the passenger traffic; but after a few hours the number of trains at night was multiplied threefold, and the sidings at Toton, which are many miles in length, were effectually cleared. The administration of the Midland Railway has long been remarkable for ability and vigour, and probably those in authority had accurately calculated their resources before they announced to the men a resolution which was necessarily unpalatable. At present it seems likely that the victory will rest with the Board; but any confident anticipation of the result would be premature. The reluctance of the men to submit to additional labour and to lower pay is perfectly intelligible; nor would it be reasonable or generous to undervalue the sacrifices which they are required to make. The strike, like other enterprises of the kind, will only be justified by success; and at present the chances seem not to be on the side of the malcontents. The hardship of a reduction of wages in various trades is greatly mitigated by the low price of necessary articles of consumption. Bread has not for many years been so low in price as at the present moment, and fuel is also unusually cheap. If the inclement weather would change, the working classes in general would not have to complain of extraordinary hard-

ships. In the recent strikes the men as well as the masters care more for the question of time than for the rate of wages.

The strike or lock-out which is expected in the iron trade may too probably attain formidable dimensions. The Northern employers have determined to re-establish the hours of labour which were curtailed in consequence of successful strikes some years ago. There is also a dispute on the rate of wages, which seems on both sides to possess only secondary importance. The trade is probably at present less remunerative than any other considerable branch of industry; and perhaps the masters may feel that they have comparatively little to lose by the discontinuance of an unprofitable enterprise. It is well known that, notwithstanding the low price of all articles made of iron, the competition of France and Belgium, even in the English market, has caused reasonable alarm. The manufacturers have for the most part refused to listen to the quack remedy of Protection under the name of Reciprocity; and they are undoubtedly right in their belief that they can only defeat their rivals by superior cheapness and quality. If the dispute is not amicably settled by concessions on one side or the other, all the advantages in the contest seem to be on the side of the masters. During the present season of depression the workmen have almost uniformly been forced in the end to submit to the terms of their employers. The ironworkers perhaps rely on the strength of their organization; and the Amalgamated Engineers' Society, which is probably the richest Trade-Union, will give them all the support in its power; but any funds which can be applicable to the maintenance in idleness of a large population must be ultimately exhausted. It is not even certain that some of the employers may not wish to teach their men a lesson. There are general complaints of the indifference of the workmen to the interests of their masters, as, for instance, in deliberate delay in the execution of work for the purpose of making it last as long as possible. Several cases have been mentioned in which the workmen have, with short-sighted selfishness, refused to comply with the conditions on which alone it was possible to accept a foreign order. It is not impossible that in difficult circumstances all parties may have committed errors; but master manufacturers have both means and motives for studying the economic conditions of their business, while the workmen and their leaders seem always to confine themselves to the single issue which is raised by a natural reluctance to do more work or to accept lower wages. The Lancashire cotton-spinners, indeed, a few months ago propounded a theory of their own, to the effect that the supply of goods ought to be artificially restricted in the hope of encouraging a demand. The precedent is not recommended either by the soundness of the doctrine or by the methods which were used to enforce it. No similar proposal has hitherto been made by the workmen in the iron trade. If arbitration is suggested as an alternative for suspension of work, the masters will scarcely consent to a mode of settlement which, as far as it is found practicable, is better adapted to disputes on wages than to the regulation of the hours of labour. A trade arbitrator on the rate of wages can rely on certain rules and traditions to determine the relation which the price of labour ought to bear to the profits of the employer. In some instances one or both of the parties may find it convenient to disguise a voluntary compromise by reference to an external authority. The expediency of increasing or limiting the duration of work can only be ascertained by experience; and, if the employers are convinced that a change is necessary, and therefore justifiable, they are not likely to abdicate their own control over the decision.

THE FRENCH ELECTIONS.

THE elections to the French Senate have, after all, contained a surprise. The result has been all that was expected, but it has also been a great deal more than was expected. The Republicans have not only secured their majority, but they have made that majority 56 votes instead of 25; and, though some of them probably hoped that this latter figure would be exceeded, it is not likely that even the most sanguine expectations suggested that it would be more than doubled. Perhaps the explanation of this under-estimate of their strength is to be found in their inability to believe that the Republican feeling of the electors would triumph, not only over adverse political opinions, but over strong personal and local claims. It is one thing to defeat a Conservative candidate of much about the same mark as the Liberal candidate, and another thing to defeat a Conservative landowner, or a Conservative duke, or a Conservative ex-Minister. It was quite conceivable that the feeling of the electors might be in the direction of sending as many eminent men as possible to the Senate, irrespectively of political considerations, and in this case several of the successful candidates would undoubtedly have had to give place to their competitors. Of course this fact is made the most of by the reactionary journals. They profess, for example, to be shocked at the want of discrimination and at the disregard for noble names and well-won honours which have been shown in the rejection of the senior Marshal of France. It will be time enough to consider how far it is the duty of an elector to subordinate political principles to military or social eminence, when some of those who thus preach have themselves set the example. General FAIDHERBE is one of the successful Republicans; but it may be doubted whether he owes his election to Conservative votes. Yet, if military qualities are to be taken into account, he unquestionably ought to have received the united support of the electors. In the melancholy record of the later months of 1871 his name is one of the very few which stand out with any distinction.

The Conservative defeat has been so crushing that it seems hardly necessary to apportion it accurately between the several sections of the party. Still, where all have been unfortunate, two sections have been more unfortunate than the third. The Bonapartists have returned only two Senators, although the departments in which the vacancies occurred included some in which Imperialism was supposed to be especially strong; and the Right Centre—the Constitutional Conservatives who look to the Duke of BROGLIE as their leader—are not much better represented. Wherever the reactionists have lifted their heads at all it has been to return a Legitimist. There can no longer be any question that, if France wants a Royalty at all, she wants a real thing and not a pretence. Neither the democratic sovereignty of the Imperialists, nor the constitutional sovereignty of the Orleanists, has placed those who profess these doctrines in any better position. The defeat was probably the result of different causes in the two cases. The Bonapartists have been guilty of the common mistake of crying wolf a little too often. They have founded their pretensions not so much on their own ability to maintain order and do all other things that it behoves a Government to do, as on the inability of the Republic to do any of them. In the first instance these confident predictions were not without their effect. A good many elections have probably been determined by the conviction of the electors that, if force had ever to be used in defence of public tranquillity, it was more likely to be used by the Bonapartists than by the Republicans. At last they have evidently become assured that the danger against which they have been so often implored to protect themselves does not really exist. The Republic has been in being a good many years, and the expected outbreak has not come. If the reactionary parties had been uniformly in power this immunity from revolutionary excesses might have been placed to their credit. But they have not been uniformly in power. There have been intervals in which the fulfilment of their predictions might be looked for, and, unluckily for their reputation, no fulfilment has come. This is an especial blow to the Bonapartists, because, if the Empire is not wanted to keep order, it is hard to say what it is wanted for. Its partisans may preach that the democratic idea is imperfect except where the Government rests on a plebiscite, but the average French voter feels that, imperfect as the Republic may be from the point of view of the democratic idea, it is democratic enough for him.

The defeat of the Orleanists has been due to a different cause. If they had been moderately true to their professed principles, it is probable that they would have remained an influential section of the Senate. The character of the candidates who have now been returned shows plainly enough that the Senatorial electors at all events are not of a very Radical type. They support the Republic because it exists and because it works fairly well, not because they have an enthusiastic preference for the Republican over any other idea. They want the substance of

constitutional government, and there was a time when, so long as they had this, they might not have much cared whether it came to them as a constitutional Monarchy or as a constitutional Republic. This temper of mind was one which would have very much strengthened the Orleanist party if they had played their cards properly. According to their professed principles, they too were bound to think the substance of constitutional government of infinitely more importance than the form. Instead of this, they showed themselves more recklessly indifferent than any other section of the Right to substance as compared with form. Provided only that they could assure the restoration of the Monarchy, they seemed willing to take their chance what sort of a Monarchy it would be. The Legitimists were consistent; they wanted to bring back HENRY V. The Bonapartists were consistent; they wanted to bring back NAPOLEON IV. But the Orleanists had no pretender of their own, and they could not support either HENRY V. or NAPOLEON IV. without throwing overboard all the principles which they had contended for, either when they were in power under the Monarchy of July, or when they were in opposition under the Second Empire. In this dilemma they tried the experiment of a coalition, and the result has shown that France does not love coalitions any more than England. One of the organs of the Right Centre finds consolation in the discovery that the elections, by placing the party which calls itself Constitutional in an unmistakable minority, gives it at the same time complete liberty of action. So long as this party formed part of a composite majority, it met with nothing but embarrassment. There were concessions to be made here and advances to be made there which prevented it from having, or at all events from pursuing, any distinct policy of its own. Now it is once more mistress of its own action, and set free from every alliance which can by possibility cause it embarrassment. The Orleanists who thus celebrate their escape from the snare of the reactionary fowler seem to forget that it was of their own free choice that they ever went into the toils. Nobody compelled them to join the most immoral political combination of modern times. They joined it because they hoped to fish something out of the general confusion which would have followed on the overthrow of the Republic. In doing so they sacrificed a singularly good opportunity of furthering the principles they professed to have at heart. They might have been the founders of the Conservative Republic. They were in no way pledged to the monarchical idea. Given that the proper constitutional checks were provided, they ought, on their own theory, to have been entirely satisfied. And at one time it pretty much rested with themselves to say what shape these constitutional checks should assume. If they had placed themselves before the country as the leaders of a united Centre, honestly adhering to Republican institutions, and determined to inspire those institutions with a thoroughly Conservative spirit, there is no reason why the millions of electors who desired nothing better than a Conservative Republic should not have followed them as readily as they have followed M. GAMBETTA. In the hope that the Republic would find no one to make it Conservative, they have stood to win by its fall. They will now have leisure in which to calculate how much they have lost by its victory.

GENERAL GRANT IN IRELAND.

GENERAL GRANT is making a tour of unusual length, and, as the movements of a man in his position are always attributed to political motives, it is not surprising to learn from America that he has been ordered by the Republican managers to keep out of the way until they have arranged for his acceptance by the party as their candidate in the next Presidential election. It is the arrival of these directions, we are told, that has determined General GRANT to go home by way of India and China, instead of by way of Liverpool. During the early stages of a canvass a candidate cannot be in a worse place than at home. If he makes speeches he is sure to give offence to some one; if he keeps silent he gives offence to every one. What is best for him and his party is that for the time he should be forgotten, without its being possible to say that he has been forgotten by reason of his own insignificance. A tour in Europe and Asia is just the sort of occupation which a candidate wants. In these days even a very moderately distinguished foreigner is sure of getting "receptions" somewhere or other, and in the case of General GRANT they are quite certain to accompany him wherever he goes. His countrymen cannot but be pleased with the compliment to the United States which is thus implied, and the accounts of General GRANT's doings in foreign parts, which reach them by every mail, are the best kind of preparation for interest in his doings at home a year or so hence. Were it not for political considerations, it is probable that when General GRANT gave up the idea of going home by way of Liverpool, he would also have given up the idea of visiting Ireland. But a possible candidate for the American Presidency must find Ireland in his way to every country under heaven. It does not matter that his destination is India, and his line of route the Mediterranean. The Irish vote has to be thought of, and how is the Irish vote to be secured by a traveller who did not think Ireland worth visiting? General GRANT has not been fortunate in his choice of a time for going there, and it may be hoped that he has had few such uncomfortable journeys during his stay in Europe. According to one of the Correspondents who has travelled with him, the chief thing he takes an interest in is a field of wheat, and in January a field of wheat is an object which appeals to the imagination rather than to the eye. Even the bogs which he is said to have inquired about are hardly distinguishable under a covering of snow.

Any interest that is taken in General GRANT's movements in this country will be due rather to the efforts of Special Correspondents than to anything that he himself has been able to accomplish. To go from place to place receiving addresses and being entertained at luncheon or dinner is not a process calculated to draw out his powers either as a soldier or as a statesman. No future historian will go back to General GRANT's Irish speeches to discover in them the first indication of a future policy. In Dublin he confined himself to the statement that there were more Irishmen in America than in Ireland. As he also said that trade was very depressed, it seemed possible that he might mean that he did not wish to see any more Irishmen in America. This might have had an injurious effect on the Irish vote, and it is possible that he was warned to speak in an opposite sense a day later. At all events at Londonderry he took pains to say that there was room for more Irishmen yet, though even here he felt compelled to add, "after a while." These two sentiments, coupled with a few commonplaces about his pleasure in seeing Ireland, make up the sum of General GRANT's contributions to the narrative of his journey. But what he has refused to do for himself the energy of journalism has been able to do for him. Every incident in each day has been carefully chronicled, and some of them really help us to form a mental picture of this great historical event. It is satisfactory to observe that General GRANT, who seems himself to have been in a sober and even stern mood throughout the visit, was attended by a friend who had evidently studied the early works of Mr. LEVER, and drawn from thence a very clear idea of what an Irish woman expects of a stranger. At Portadown, it seems, the GENERAL had to wait half an hour in a refreshment-room, and here he was asked by a waiting-maid whether he would "handsell" her. Some one undertook to explain that to "handsell" meant "to give something for luck," and that this was a custom specially appropriated to the first Monday of the New Year, which happened to be the day of the GENERAL's visit. General GRANT, it is stated, "did not give this winsome edition of Mr. THACKERAY's "'PEG of Lunavaddy' anything for luck; but one of his "staff offered to kiss her, an honour she declined with "playful blushes." With this exception, the humours of the journey seem to have depended rather on the bystanders than on the travellers. There is certainly something odd in the idea of a solitary Ulsterman coming up to the carriage window, while the engine was stopping for water, and, after calling for "Three cheers "for General GRANT," proceeding to give them all by himself. So there is, too, in the inquiry overheard by a correspondent "Who is this GRANT any how?" and in the answer, true if inadequate, "I believe he fought in "the American war." For once General GRANT must be grateful to religious intolerance. In this weather he may be excused for wishing to get into a warmer climate as speedily as possible, and the action of the Cork Corporation spared him the necessity of going to the South before

leaving Ireland. When an announcement of the GENERAL'S intention to visit Cork was received from the American Consul it was moved that the Corporation should give him a proper reception. One of the Catholic members at once protested against this on the ground that when President General GRANT had insulted the Irish people in America and got up a "No Popery" cry there. Another member declared that it would be highly unbecoming in the Corporation of Cork to pay any mark of respect to General GRANT, and another, prefacing his remarks by the anxious assurance that he was no bigot, declared that the ex-PRESIDENT had gone out of his way to insult the Catholic religion. Under these circumstances the Consul's letter was simply entered as "read," and nothing further was done in the matter. It must be an occasion of just pride to the Corporation of Cork that they should have been the only public body in Ireland who remembered their duty at a very critical time. It is so seldom that an American President has an opportunity of doing anything for or against a religious creed, that other Catholic bodies in Ireland never seem to have bethought themselves of hunting up General GRANT'S record on the subject. In one case, indeed, even a Roman Catholic Bishop was present at a dinner given in his honour; so that the Aldermen of Cork may now feel, like M. VEUILLOT, that they are more Catholic than the Episcopate itself. To have made General GRANT alter his plans, and leave the South of Ireland unassailed and unconquered, is a very high honour for the city. To spite your neighbour for religious motives is a commonplace virtue; but the people of Cork have by their representatives succeeded in spiting themselves.

Throughout General GRANT'S journey there is one point, and one only, of any serious interest. Wherever he was shown any Irish manufactures, he invariably remarked that the Americans would soon do that kind of thing for themselves. General GRANT'S idea of encouraging American manufactures is probably an entirely wrong one—wrong, that is, in the sense that he will go the wrong way to work to accomplish his object. But the GENERAL is in matters other than military a very fair type of the average shrewd American; and it may be useful to notice how large a part the coming manufacturing greatness of America seems to play in his thoughts. American competition stands on a wholly different footing from the competition of any European country. European countries have usually to bring the raw materials the same distance that we ourselves have; and if they rival us it must be simply in workmanship. The Americans have the raw material of many industries and the means of working them lying close together; and they can therefore save the cost of carriage as regards the supply of their own country, and reduce it as regards countries lying nearer to themselves than to us. There can be no doubt that their attention promises to be more and more turned in this direction, or that the consequences are likely to exercise a considerable influence on the future of English industry.

THE ACCIDENT ON BOARD THE *THUNDERER*.

ONE result of the bursting on board H.M.S. *Thunderer* of the most powerful gun at present used in the navy cannot be contemplated without grave apprehension. It may give rise to a feeling amongst seamen which will do great harm and will be eradicated with much difficulty. The impression which the disaster has produced is now general, and it has attracted universal attention; but in the constant excitement of modern life misfortunes which at first seem appalling are soon forgotten, and before very long this calamity will be as little thought of as others which have happened during the past twelve months. With the sailors of the fleet the case will, it may be feared, be very different. Liable to be killed as the unfortunate men who were in or near the turret of the *Thunderer* were killed, they will long retain a vivid memory of the catastrophe, and this cannot but produce an evil effect. The courage of English seamen is proverbial; yet after all they are but men, and the boldest men may be daunted by the thought that they may suddenly be destroyed by the guns which they have to serve. Before this accident, if any one had said on board the *Thunderer* that there was a likelihood of the 38-ton gun bursting, his forebodings would probably have received about as much attention as is given to the terrors of an old woman who is afraid of an unloaded fowling-piece. Now such an anticipation of disaster might rouse very different feelings; and it is difficult to exaggerate the gravity of the fact that, unless sailors are not only brave but above all human weakness, a certain amount of apprehension with regard to the use of the big guns is almost inevitable. During the great war it was well known that the bursting of a gun on board a ship in action discouraged the men more than the most severe execution by the enemy's fire. A naval engagement now seems, indeed, sufficiently improbable; but unfortunately this new danger, where it exists, is quite as great in ordinary practice as in action. Courageous as men can be, English seamen can hardly help feeling for some time to come a certain distrust of the ordnance employed on board men-of-war.

That the authorities will do all in their power to dispel this feeling is to be hoped, and clearly the only course open to them is to ascertain, if possible, the cause of the disaster, and to make widely known the means by which a recurrence of it may be prevented. At present there certainly seems to have been no neglect in this respect, for a preliminary inquiry has apparently been already held on board the *Thunderer*. There is not as yet any intelligence which can be relied on as to the conclusions arrived at, although a statement respecting them has been published. It has been announced that information has been received at the War Office to the effect that the inquiry has left no doubt that the cause of the explosion was imperfect loading. Naval officers who had conducted an inquiry on board a man-of-war would report, not to the War Office, but to the Admiralty, and this announcement cannot therefore be considered as trustworthy, though very possibly the true reason of the disaster is indicated. A further investigation—which certainly should be of the most thorough character—is to be made, and when this is over the gun, or rather what remains of it, is to be brought to England, in order that the most highly qualified men may examine it. As the chase or muzzle of the gun—probably with the shot in it—is at the bottom of the Sea of Marmora, it may prove no easy matter to decide with certainty on the cause of the accident; but assuredly no effort should be spared. That the catastrophe will, if an explanation of it can be obtained, be found to have been due to preventable causes may safely be predicted; but some apprehension may be felt as to what those preventable causes may prove to be. A wrong system of rifling, for instance, is a cause of accident which may be prevented by adopting a right one; but to remodel all the guns in the British navy would be a tremendous task and would require a great length of time. Fortunately, however, there is good reason to hope that the accident may be clearly shown to have been due, not to a radical defect of this kind, but to a faulty system of loading, which can be improved; or to haste and neglect of necessary precautions.

Such, at least, are the views which—judging from the information which has hitherto been given—seem most likely to be right respecting this disaster. The opinion which appears to be most generally held and to prevail amongst the officers of the fleet is that the projectile was, at the time of firing, some distance from the chamber; and that, in consequence, the gases generated by the explosion of the gunpowder were suddenly checked in their expansion and burst the gun. Too great haste in loading has been thought to be the reason why the shot was left separated from the powder; but Lord CHARLES BERESFORD, who, having been for a time Commander of the *Thunderer*, is entitled to speak with some authority, attributes this to a different cause. In his letter to the *Times* on the subject he points out that the guns of the *Thunderer*, when being loaded, have to be considerably depressed, and he says:—"It is perfectly "possible, though not probable, in withdrawing the "rammer, to pull the papier-mâché wad which is held in "the rammer-head by means of a small projection on the "wad out a little way; this is aided by the weight of the "projectile pressing behind it (the wad). It is almost "impossible for the men and officers working the gun to "know if what I have suggested has occurred, as the "'tell-tale' on the rammer has shown the shot as being "home; but there is nothing to show that the shot may "not get 'started' and follow the rammer out a short "way afterwards." He therefore advocates the use of wedge wads which would not slip in the manner described.

Lord CHARLES BERESFORD'S suggestion certainly seems to offer an explanation of the catastrophe; but his opinion

differs apparently from that of other artillerists, who think that the accident was caused by the shot being impeded by the wad. This, a disk of papier-mâché, keeps the projectile in its place, and, when the gun is fired, ought to be blown out by the windage—*i.e.* by the gas which escapes round the projectile. To prevent excessive windage, there is a gas-check, which consists of a disk of soft metal, placed at the base of the shot, and fitting the rifled barrel very closely. It is thought that, in the case of the *Thunderer's* gun, the gas-check may have done its work too well, and that there may have been no windage to drive out the wad. Even papier-mâché cannot be compressed beyond a certain point, and the wad may therefore have jammed or stopped the shot. It is also thought that the gas-check itself may have been jammed, or that the studs round the projectile, which fit the grooves of the barrel, may have worked out of the grooves along which they should have travelled, and have arrested the progress of the shot. That this may have caused the accident, and that it is not utterly unlikely to happen with other of the guns, is the opinion of Mr. Merrifield, late Principal of the Royal School of Naval Architecture, who, like Lord Charles Beresford, has written to the *Times* on the subject, and who argues that the system of rifling which has for long been followed at Woolwich is altogether wrong. According to this plan, the twist of the grooves in the rifled barrel is not a uniform one, but increases from breech to muzzle, the object of thus giving a varying twist sharper near the muzzle than near the breech having been to prevent the great strain which would be put on the shot at starting if it had to take up considerable velocity at once. Mr. Merrifield considers that the advantages thus gained are very small, and that this system has the great defect of making it impossible that the shot should fit the rifled barrel, and of rendering it necessary that there should be on the shot studs of soft metal to travel in the grooves. In order that the gun may be loaded, these studs have to be made so as to fit loosely, and Mr. Merrifield maintains that there is danger, "partly due to the softness of the "studs, but greatly enhanced by the loose fit, of the studs "overriding the rifling, and jamming the shot in the "chase of the gun," and that there is "the further danger "of one of the studs getting adrift, and so jamming the "shot."

It is greatly to be hoped that he is in error in supposing that there is any appreciable likelihood of such accidents, for if he is right, a large proportion of the guns in the service are dangerous to those who have to work them. His condemnation of the Woolwich system is, however, in all probability greatly exaggerated, for his argument has the fault of proving too much. If the method of rifling followed at Woolwich is as bad as he states it to be, accidents like that on board the *Thunderer* would not be uncommon. It is well known that during the trials of guns they are frequently fired a great number of times with huge charges of powder, and if the plan of rifling them had the radical defects which Mr. Merrifield attributes to it, there can be little doubt that a certain number of these guns would be shattered just as the 38-ton gun was shattered. This does not happen, and it may fairly be assumed that there is no such radical defect in existing naval ordnance as to make it necessary that the whole of it should be reconstructed. So far as can be gathered from the scant information which has hitherto been given respecting the bursting of the gun on board the *Thunderer*, it seems most probable either that the shot was some distance from the chamber at the time of firing, or that it was jammed by the wad. According to the ambiguous statement which has appeared, the catastrophe was due to the first of these causes. Should it be clearly shown to be due either to this or to the other, it will probably be found practicable to make the recurrence of a similar misfortune impossible, or at all events to show that it can only be brought about by great negligence. What is now all-important is that the most earnest efforts should be made to discover with certainty the cause of the accident. This done, measures for preventing its recurrence will doubtless be promptly taken; but, if the disaster on board the *Thunderer* remains in any way unexplained, sailors will inevitably feel a mistrust as to the guns they have to fight which may have very grave consequences.

THE STUDY OF GREEK.

A DISCURSIVE controversy involving matters of some importance has been raised by the memorial addressed to the University of Cambridge by a number of persons entitled on various grounds to speak with some authority on education. The object of their memorial is to procure the abrogation of Greek as a compulsory subject in the examination commonly known as the Little-go. Two questions are raised by this proposal, or a question with two distinct branches—Whether the study of Greek ought to be kept up as a normal and integral part of the higher education in England? and whether, if that is accepted as a desirable object, the best way to promote it is to require a certain beggarly minimum of Greek in the least important and interesting of University examinations? The second branch appears to us of little importance in comparison with the first, except so far as it may be mixed up with it in public estimation. But this last qualification is not without importance for the practical view of the matter. The general public knows next to nothing of the machinery of education; even most of those who go through the University course themselves never have a very clear notion of it, and retain but a confused one by the time they have to think of educating their sons. And the public notion of the work and the requirements of the Universities is founded, not on the most that they encourage scholars to aim at, but on the least that they compel idle men to perform in order to obtain a degree. The general course of instruction in our schools is also very sensitive—in our opinion much too sensitive—to every change in the subjects, schemes, and regulations of University examinations; and the general character of the instruction must be determined by the aims and capacities of ordinary rather than exceptional pupils. Considering all these things, it appears to us that compliance with the prayer of the present memorial would almost certainly be taken by the English public as an official manifesto against the study of Greek, and would practically be taken in the same sense by a good many schoolmasters. Nor would this effect be compensated by anything that might be done at the same time or afterwards for archæology and the higher branches of scholarship. It would still go forth to the world that Cambridge had officially decided Greek to be a speciality, like Arabic or Sanskrit, having no peculiar or necessary connexion with liberal education as such. And the effect of an impression of this kind would, we believe, be most disastrous. We are not prepared to see such a risk incurred without very grave cause being shown, or without being satisfied that the risk has been duly weighed, and that the means of diminishing it have been carefully considered. Whether the majority of men who take an ordinary degree at either University under the present system can be said to get much good from their compulsory minimum of Greek is another matter. But it seems to us that the remedy which should be tried first is not to leave off teaching Greek, but to teach it better.

Our own opinion is that, so far from having too much Greek in English education, we have not nearly enough of it. Greek and Latin enjoy a just prerogative in the elements of a liberal education, not only because of the value of their grammar as a mental discipline, or because of the merits of their literature, but for much wider reasons. The arts and letters of the civilized world are Greek, as its laws and history are Roman. This is in brief the ground on which the unique interest of Latin and Greek is based, and on which it will remain established as long as the continuity of civilization endures. In this point of view the two languages have a co-ordinate and inseparable claim upon us. We cannot follow the argument of one or two enthusiastic champions who strive to draw a distinction in favour of Greek. To maintain that, if one of the two languages must go, it should be Latin, is possible only as a controversial exercise. "Greek," we are told, "is in every respect more valuable"; surely not in respect of its importance as an instrument by which the affairs of mankind have actually been conducted. Greek was the common language of the world that lived under the Roman Empire, but Latin has been the common language of a world much nearer to us and more closely affecting our own thoughts and business. The Greek language is richer; it is very true. "Its literature is incomparably superior"; be it so, though we might possibly object to so strong an expression. But these are not the only things we have to consider. We cannot assume that the ornaments of life, however beautiful and priceless, are more needful to be understood than its solid framework. And the frame of modern society, the ground-plan of modern history and politics, is largely Roman, the work of men imbued with Greek ideas, but of Romans nevertheless. Latin is an instrument of most needful daily use for every one who means to get below the surface in law, philosophy, antiquities—in short, in any branch of knowledge which requires us to take account of even a moderately recent past. Pure science can be mastered, no doubt, without Latin; but not the history of scientific ideas, the possession of which may give great value to an amount of scientific knowledge which by itself would be worth little. Whoever does not know Latin is at the mercy of second-hand information with regard to a vast number of subjects, with more than one of which every educated man is likely to have somewhat to do in the course of his life, if not of his ordinary work. We do not think the same can be said of Greek. It is rash to make large assertions on a matter which must in each case be of personal experience; but we conceive it must be the common experience of men who have left the Universities with a fair reputation for scholarship and betaken themselves to other than strictly scholastic pursuits

that they have occasion to read or consult Latin books and documents, ancient or modern, half-a-dozen times for once that they refer to a Greek author. Latin is a tool constantly in hand, a possession of necessity for a man whose pursuits and tastes are in any degree scholarly. Greek is an inestimable delight, a treasure for whose loss no price could make amends; but, as concerning the uses of life, it must be admitted to be a luxury. For the practical needs of a scholar French and German stand before Greek, though hardly before Latin; for the needs of common affairs French and German are of course more important than either of the classical languages. We shall hardly begin to think Latin a luxury till we have already pronounced Greek a superfluity.

We deprecate, therefore, any serious attempt to sever the cause of Greek from the cause of Latin. We see no reason why either should go, and we stand for both together, one of our reasons being that neither of them can be adequately known without the other. Roman literature is formed upon Greek models; Roman laws, institutions, and society have caught the quickening fire of the Greek mind, and so have carried it on, often dimmed but never quenched, until it shone forth again with its own light. There is no mutual debt of the same kind from Greek to Latin; but Latin was the medium through which modern scholarship and teaching long worked upon Greek; and the Romanized Greek world of the Renaissance has in fact been, until our own time, the Greek world of all modern literature. And the custom of writing critical notes and essays in Latin, though decaying, is not by any means extinct. We do not mean for one moment to defend the practice of learning the elements of Greek from grammars written in Latin, which flourished in this country almost in our own time. There is no solid reason why Latin should come first; and the opinion expressed by Mr. Oscar Browning, that "in a well-ordered education the study of Greek should precede that of Latin," was held and acted upon by the late Bishop Blomfield, a scholar of no mean renown, in the education of his own family.

It is possible to point to men who have attained eminence in the most refined branches of art and literature with very little classical knowledge. Not only could Goldsmith's Professor in the *Vicar of Wakefield* earn four thousand florins a year without any Greek, but Keats could write poetry as Greek in spirit as Shelley's. But this is the old story of native genius doing great things with imperfect means, which confronts us in every walk of life. It is no warrant for persons who have not the genius which is a law to itself to neglect the means within their reach. If we have had great poets who knew no Greek, we have also philosophers who know no German, and successful men of business who know no language but their own, no history, no science, in short, nothing but the practice of their own trade. There is hardly any argument for treating Greek or Latin as a mere speciality which cannot be urged with equal force as to every sort of knowledge and accomplishment beyond the bare rudiments of reading, writing, and ciphering. It may be said that scientific training is even more important for modern liberal education than languages, and that room must be made for science at any cost. As to the importance of science we agree, but the natural sciences are not the whole of science, and we should aim, not at the separation of letters and science into distinct camps, but at their alliance and combination. The study of languages ought to be as scientific as any other, and our students should as early as possible be shown that scientific method is essentially the same in all branches of knowledge. If more time is required for the teaching of natural science, as we believe it is, it should be gained, not by starving the classics, but by economizing the hours now wasted by the use of obsolete and irrational methods. So far from opposing the scientific bent of modern thought, our directors of classical education should welcome it as a help to making the teaching of the classical languages more vigorous and thorough

What, then, can we practically do to put new life into the study of Greek and Latin, and to make it a real interest to average students, instead of a dry and irksome discipline? Much is to be done, we believe, by using classical art along with the classical languages as an instrument of education. On this subject we said a word or two on a former occasion; and we further suggested, though not with much hope of any one receiving it seriously, that it might be well to take up the modern pronunciation of Greek, not as being identical with that of the age of Pericles, but as being descended from it by an unbroken process. Englishmen would thus learn from the very first the continuity of Greek life and language, a fact which is not only of historical importance, but may become of immediate political importance for England within a generation or two. We now repeat our suggestion, and carry it a step further. Any scheme that may be devised by the Universities to promote the study of classical art and archæology must by the nature of the case include provisions for travelling scholarships or the like, whereby students will be encouraged to go to Rome and Athens and see the monuments of the ancient world with their own eyes. When we have once got our travelling students, why not encourage them to acquire such a knowledge of Greek in its own land as will enable them to teach it as a living language when they come back? We believe that on this plan a competent knowledge of both the ancient and the modern tongue might be imparted in the time that is now consumed in painfully and barely attaining the standard of the Little-go. Nor is the proposal altogether new. For years past the same principle has been maintained and, if we mistake not, acted upon with success by Professor Blackie of Edinburgh.

The introduction of such a system would naturally be a work of time, as it could be carried into effect only by a generation of teachers trained for it; thus there would be ample opportunities to settle points of detail by experiment. Only two objections present themselves, as far as we can see; that the thing is a novelty in itself, and that it would call for more trouble and special preparation on the part of the teachers. But these objections are common to all reforms in education. Improved methods demand greater skill to work them. Teaching is already recognized as an arduous and honourable profession; we must not be afraid of some increase in the difficulties, and we must be prepared to increase the honours in proportion.

DIDACTIC FLIRTS.

MANY readers of *Daniel Deronda* may remember—if thick-coming novels have not obliterated all recollection of the subject—their surprise at Daniel's popularity with women. Why should two charming girls bow down and worship this preaching prig? people probably said to themselves, and doubted whether the author of his being had not made a mistake. But there really was no mistake, and George Eliot only gave a proof of her knowledge of the mind of modern girls. Daniel was, to put it in two words, an educational flirt. Hence his success with the fair.

That a young gentleman who was nothing if not scientific, reflective, and didactic should win women's fancies with a word, or, even without a word, with a glance, would have seemed strange to Fielding, absurd to Scott, improbable to Thackeray. Yet so rapid a change has passed over a small minority of young women that the educational flirt, the worldly college Don, has his day, like those old favourites, the officers of the army and the clergy. Perhaps there is nothing to be regretted in this. We cannot all be cornets and curates, and the heroines of fiction must sometimes come down to inferior beings, and bestow their affections otherwise than on martialists and divines. They will find educational young men less easy to fix, more volatile and faithless than their old friends. As time goes on, however, they will begin to understand their educational young man, and to gauge beforehand his lack of "satisfactoriness," as it is called. They will learn by the experience of generations that his charms are not sterling, and that he is certain to flutter off, like a learned butterfly from the full-blown flower, to aid some fresh blossom to expand.

To assist blossoms to unfold themselves is the mission of the educational flirt. It is the buds that he cares for; the mature rose can take care of herself. The buds of an intellectual turn enjoy the process while it lasts, and it is fortunate for the educational flirt that the minds of many modern girls are intent on the "things of the intellect." As maidens once used to admire manly valour and revel in the fluent talk of "the military," so maidens now pine for everything that can be called "higher"—from the higher culture to the higher curves. Yet it is often, if not always, the fate of the aspiring to be born into an essentially commonplace family. They have brothers in offices or at public schools, and sisters who potter about the parish and set their hearts on the distribution of red flannel, tracts, coal, and soup. To the girl in a family of this kind who has unawakened faculties and a dormant taste for culture the educational flirt appears like a sober specimen of the fabled fairy prince. He is not "lighter footed than the fox," but he is an examiner in many examinations, a reader of the *Esoteric Review*, and he knows a man who once met Mr. Whistler at dinner. It is the joy of his life to pose as a master in the midst of fair disciples, and he is never so happy as when he is lecturing to ladies. What satirists have so often said in their original way about curates might be said with equal truth about the educational flirt. Like the curate of the past, he is "most interesting," and his very scepticism makes him an object of tender anxiety. He has "seen so much of the world" (from rooms in college); and here he has a pull over the old favourite, who is distanced for the moment, but may come again when culture grows a weariness and the educational flirt has sought another district. Meanwhile it will be allowed that this accomplished man, who knows all about the growth of the English Constitution and about Campanian wall-paintings, who is equally ready to look over essays on Anglo-Saxon literature or copies of Greek prose ("ladies' Greek, without the accents") is a fortunate person. He supplies a modern want; he is the guide and moralist of dozens of girls; the harmless Abelard of many "staid" Heloisas.

The educational flirt is a kind of Admirable Crichton in a small way, and can speak instructively and impressively about almost everything of interest. He likes to guide the taste and mould the mind, and the minds of many ladies are eager for nothing so much as to be guided and moulded. It is easy to see how an educational correspondence about Political Economy may glide into an interchange of views about the meaning of the world and about the mission of women and men. Instruction in English composition may be illustrated on both sides by examples of original verse. The sympathy which narrow-minded sisters and brothers whose thoughts are straitened by commerce cannot give is readily imparted by the educational flirt. He is a student of humanity and of character, and character unfolds very rapidly in the sunshine of æsthetic discussion. When it has quite unfolded, when Heloisa knows all about "sociology" and spectrum analysis, about the theory of rent and the influence of Greek art on Italian sculpture, about Biblical criticism and the origin of language, it is time for Abelard to go and plant the standard of culture in some other

quarter. Heloisa is now able to go about doing good on her own account. Poor Heloisa! she cannot possibly carry the war into Africa, she cannot march to and fro converting young men as her Abelard converts young women. It is a very remarkable fact that men, unlike girls, do not enjoy being proselytized in this way. If the male educational flirt meets the proper sort of young lady, he can lay down the law with much acceptance. The learned and talkative lady, on the other hand, never meets the right sort of convertible young man. If she introduces political economy, or metaphysics, or geology, or primitive man, to the youth who sits next her at dinner, or to her partner in the dance, she finds that he is not interested. If he is a stupid young man, of course his dulness needs no explanation. If he is known to be a clever young man, yet he is not responsive. If Heloisa could see into his heart, she would find that he is grumbling at having "shop" talked to him. His college friends, Smith or Brown, will entertain him with "the Notion," with "categories," with neolithic talk, with discourse about everything that is "high" or "higher," in walks round the place called Mesopotamia or on the Trumpington Road. It is to help him to forget that kind of thing for a while that he is conversing with Heloisa. Now this is a hard thing, and difficult to be borne. It is hard for both sides; hard for the man, who is bored; and for the woman, who thinks herself snubbed. Nay, there are some young men so lost to a sense of the respect they owe to women that they will draw their learned companion out, as they say. The worst of an education conducted on the principles we have described, the worst of the "culture" imparted by the educational flirt, is its wordiness, its shallowness. The pupils have misunderstood almost all the "tips" (as they are technically called) of their teacher. They know many things, like Margites, but they know them all wrong. To young men with more humour than courtesy it seems not unamusing to listen to a flow of pretty blunders from the lips of ladies who are happy in the belief that they are displaying an intimate acquaintance with the philosophy of Kant or the theory of Noiré. But the joke is one which soon palls, and it is difficult indeed for the modern Diotima to find a Socrates, a humble-minded man who will sit at her feet and be her pupil. Thus education by flirtation is a very one-sided game. To play at it one should be able to move about freely, and choose new partners every three months.

Cynics have asked whether the ardent desire of woman to be educated has produced that new variety of man, the educational flirt, or whether the existence of educational flirts has produced the novel wish to be educated. It is impossible to give a direct answer to this question. Flirtation and education, the study of mathematics and political economy by ladies, the study of ladies and of their "character" by men, have advanced together. They act and react on each other; their influences cannot be disentangled. If we are very earnest believers in the higher education of women, we may look on the educational flirt as an unconscious instrument in the spread of learning. He flits about like the bee to amuse himself and gather honey; but he scatters a good deal of learned dust as he flits. He is not always a very candid person; he may not always know his own intentions very clearly; but, on the whole, his influence is not all bad. This is not a very high compliment, to be sure, for the influence of war, pestilence, and famine seems to many philosophers to be beneficial in the long run. When education has become a recognized and organized thing, when all women who care for it are instructed like men, as a matter of course, the occupation of the didactic flirt will be gone. He will no longer have the charm of rarity and mystery. He will turn out to be no wiser than his brethren. He will cease to seem to possess strange secrets and hidden lore. No one will believe in him; he will be found out and will be reduced to the rank of other unprivileged men. While he is as dear to the fair as "the officers" were to Miss Austen's Liddy and Kitty, his fellow-men speak harshly of him, and "cannot see what women see in him." Soon he will have to discover some new way of being interesting, for the class of "dons of the world" has no permanent qualities. Meantime its members, if we may judge by ladies' novels, have temporarily succeeded to the old heroic hero, the brutally rude hero, the tenderly religious hero, and the ordinary pleasant young man. One drawback in their characters is certain to prove fatal to them with the novelist. They are too apt to shake their light wings and flit on, leaving a novel and a flirtation to end not well.

A SCEPTIC'S APOLOGY FOR PERSECUTION.

In the current number of the *Nineteenth Century* Mr. Mallock concludes a series of papers which he has been contributing to that magazine with an article on the "Logic of Toleration," and in doing so he takes occasion to remind his readers of what indeed was already well known but had apparently been forgotten by some of them, that his "criticisms of Catholicism are not the criticisms of a Catholic but of a complete outsider—a literal *sceptic*"—who however desires to estimate fairly the character and prospects of "the one existing religion which seems still capable of either appealing to or appeasing the religious condition of our time." This does not of course make his criticisms less, but in one sense more, deserving of notice. With the earlier part of the paper, which discusses Dr. Tyndall's "Agnosticism," and contains, like the author's former articles, much that is well deserving of attention, we shall not deal here. The argument of the latter part against "the practical agnosticism which we call toleration" will sufficiently occupy our present space. Mr. Mallock insists that, whatever individual Catholics may say or think to the contrary, "Catholicism is justly charged with a fundamental intolerance." And he is careful to explain that by intolerance he means not only a conviction of the exclusive truth and importance of the one faith, which is of course necessarily held by all dogmatic believers, but "potential persecution"—that is, persecution whenever circumstances render it feasible and expedient; and by persecution he means "the use of coercive measures to restrain a man, if not from holding, at all events from communicating his (heterodox) opinions to others." This is implied, he thinks, in the acceptance of any dogmatic creed, is in fact "but one facet of all certain beliefs that have any practical import." And the practical importance of the creed is twofold. The assent to it is salutary in itself, and is also valuable in its results on conduct. As regards this last point we may observe in passing that Mr. Mallock does no more than justice to the dogmatic position; but it does not follow that he is justified in deducing from it the principle of persecution. Before coming to his argument it may be well to repeat a caution of his own, which may help to disentangle the discussion from the embarrassments of religious prejudice or bias, namely that what he says of Catholicism would apply equally to any religion—Christian or non-Christian—claiming a special truth and saving value for its doctrines. We shall speak throughout, as he does, for convenience sake, of Catholicism and heresy, but our readers must bear in mind that for all purposes of the argument the terms stand for any positive and exclusive religion, true or false, and the denial of it; and in fact both Protestants and Pagans have often persecuted, when they had the opportunity, on much the same grounds as are alleged in defence of Catholic persecution.

Mr. Mallock, while modestly confessing that his arguments are not new, is far too skilful a disputant not to present them in the most plausible form. He opens his apology in the following vigorous passage, where we have italicized a few words for reasons that will appear in the sequel:—

> This being the case, let us suppose for a moment that *an entire nation is unanimous in its assent to a single creed*, and that on this creed the whole value of their lives depends for them. Considering it to be certainly true, they consider it necessarily to be the one legitimate conclusion of their moral and intellectual faculties; and any denial of it can therefore arise only from either moral obliquity or from intellectual imbecility. Suppose then that in such a nation, a man arises who does deny this creed, and who cannot be convinced that he is wrong in doing so. If he be not an immoral man, nor an advocate of immorality, the nation will regard him but in one light—that of a man suffering from a kind of mental ophthalmia: *as such*, he will be nothing but an object of pity, and if his case be evidently incurable, he will simply be left alone. But, if it should appear that his disease not only afflicted him, but was in a high degree contagious, it is evident that the only possible course will be to prevent any further intercourse between him and his fellows. He must be placed in a kind of perpetual quarantine.

A nation, he adds, thoroughly persuaded of the truth and importance of its creed—"be it Mahometanism, Catholicism, or dogmatic Atheism"—will punish heresy as surely as it will punish theft; which, by the way, is not quite the same question as whether it ought to do so. The case may be viewed as strictly analogous to the enforcement of sanitary restrictions or criminal punishments, and it does not much matter which view we adopt, as the result in either case will be the same. The "leper," whether voluntary or involuntary, must be secluded to prevent his spreading his leprosy. Persecution may be regarded as corrective, retributive, or preventive, but it is sufficient for all practical purposes to confine ourselves to the latter view of it. Persecution which fails to be prevention defeats its proper end. It is only justifiable when it is sure to succeed, but whenever it is justifiable, it is a duty. If there are but three or four heretics in an orthodox nation, success is certain; as their number increases it ceases to be certain, and soon becomes hopeless, and then persecution is wrong because it is sure to fail. Mr. Mallock will not listen to the plea of Mr. Mivart "among modern English Catholics," that if there be only one heretic in an orthodox nation, his conscience has a claim to be respected. He rejects it on the not very intelligible ground that, "when it is a duty for the majority to persecute, it is a privilege for the minority to be persecuted; and if they are not enough in earnest to accept the pain as a privilege, they very certainly deserve it as a punishment." A punishment for what? for their pusillanimity or their heresy? If the former, it seems rather hard to punish men for not being heroes; if the latter, that is begging the very point in dispute. Mr. Mallock, however, adds certain considerations to mitigate the apparent harshness and illiberality of his conclusion. The persecutors must represent the entire moral and intellectual force of the nation, and they ought to deal as tenderly as they can with the suppressed dissentients:—

> It is forgotten that to persecute with success, and therefore with justice, the religion that persecutes must embody the entire force, moral and intellectual, of the nation. Its ascendency must represent the fact that a national decision has been come to; and that the national thought, whose freedom was for a long time anarchy, has at last arrived at more perfect freedom, which is order. It is forgotten, further, that persecution is not essentially a cruel or barbarous thing. It has been peculiar hitherto to barbarous ages; and it was conducted, naturally, in a barbarous manner. But this is only an accident of it; it is not the essence. How distorted the conception of it is in the popular mind, may be seen in the fact that a common synonym for it is *the stake*.

In former ages of persecution torture and barbarous methods of punishment were the general practice in the administration of civil as well as ecclesiastical law, and the salutary change

which has come over the one would of course apply equally to the other. Moreover "the moral sense of the Church," enlarged by a wider experience, has learnt to regard heresy and atheism as usually rather misfortunes than crimes. It must also be remembered that the laws of every Christian country, and our own among them, are based on certain views of morality, and so far as those views are enforced, the law "acts strictly as a religious persecutor." There is *e.g.* a certain censorship of the press and the theatre, and certain kinds of vice are treated as crimes of the gravest kind. Nor would the most tolerant of men be willing to allow a temple of Priapus to be opened in Piccadilly or a course of public lectures delivered in his honour. And Protestant parents who keep Jesuits out of their homes and licentious books out of the hands of their children are so far claiming a right to religious persecution on the child's behalf.

Mr. Mallock has a plausible case, and he has argued it with exceptional plausibility. He will find many of his fellow "sceptics" more than ready to agree with him, and plenty of "Catholics" eager to accept the questionable apology he has put into their mouths. The chief weakness of his plea lies in his so completely passing over some of the most important considerations, moral and historical, bearing on the question, as to appear absolutely unaware of their existence. But first we may say a word on his concluding *argumentum ad hominem* from the English law. So far as any forms of *vice*—we purposely italicize the word—are criminally punished as such, it is difficult certainly to explain the procedure except as a survival from the period when the law professed to deal with heresy and other sins condemned by the Church, as sins. But there are very few cases of the kind—only one occurs to our memory at this moment—and those specified by Mr. Mallock fall under a different principle. The outward exhibition of gross obscenity or blasphemy is punished, not as being sinful, though no doubt most Englishmen so regard it, but as an outrage on the public taste and conscience—in other words, a public nuisance; and the case is not analogous to the suppression of heterodox teaching, for no sane man affects to feel a conscientious obligation to preach "the practical worship of Priapus," however ready he may be to do so from mercenary or baser motives. The case of children again is so obviously peculiar and irrelevant that we rather wonder at so acute a reasoner introducing it. No parent, out of Bedlam, however strong a Liberal or sceptic, would think it right or practicable to conduct their education on the principle of letting them do just as they pleased. But these are the mere fringes of the argument. Does it properly follow from a conviction of the exclusive truth and importance of Catholicism—as we have already explained the term—that it is justifiable and therefore obligatory to suppress all open attacks upon it, whenever there is a good prospect of such policy proving successful. That is the point at issue; and our first comment is one which concerns the case of Christian persecutors only, which however falls directly within Mr. Mallock's plea: the rest will apply equally to the general principle. Mr. Mallock says that a nation unanimous and really convinced of the truth and importance of its creed—"be it Mahometanism, Catholicism, or dogmatic Atheism"—will "persecute heresy as surely as it will prosecute for theft." But the question, we must repeat, is not whether it will persecute, but whether it ought to do so, and that is perhaps rather a difficult question to answer, or even to discuss, on the Atheist hypothesis. As to a Mahometan nation, there can be no doubt that it ought to persecute, for that is expressly enjoined in the Koran. But Catholicism cannot afford to ignore the teaching of the New Testament, and it is almost a truism to say that, so far from being sanctioned or enjoined, persecution appears to an ordinary reader to be (to say the least) discouraged by both the letter and spirit of the New Testament. Mr. Mallock says not a syllable on this subject. Of course he may have an answer ready, but he does not give it, and he has thus left wholly unnoticed one strong *primâ facie* objection to his conclusion. Nor can he plead that the infallible Church has decided against such an interpretation of the New Testament; for in the first place there is no consent among Catholics, as his own paper shows, that it has so decided, and in the next place, his argument is meant to apply just as much to the obligation of dogmatic Protestants to persecute as of dogmatic Catholics, and they would at once raise this objection. And now it is time to pass to the general argument.

We have seen that Mr. Mallock limits the cases where persecution is expedient, and therefore right, to those where an entire nation is morally unanimous in its assent to a single creed. Wherever this is so, it is bound to persecute, and the only objection that can be consistently urged is "that on religious matters there is no certainty attainable." This assumes, to begin with, that when the whole nation is thus unanimous persecution must necessarily succeed; "success," Mr. Mallock says, "will be certain." Will it? The nearest approach we know of to a persecution based on this sort of national unanimity may be found in the forcible suppression of Protestantism in Italy and Spain during the sixteenth century. We do not instance the complete and suicidal failure of the Marian persecution in England, though the overwhelming majority of the nation was unquestionably Catholic in its beliefs at the time of Mary's accession; because it may be replied that if her career had not been cut short by an early death, her policy would have succeeded. But what of Italy and Spain? There persecution succeeded, if it ever did; Protestantism was stamped out in the blood or the expulsion of all its votaries; yet the success was rather temporary and apparent than real. The result has proved very like that of driving a fever or a rash into the system instead of allowing it to come out on the surface. Protestantism was stamped out for the time in Spain and Italy, but it will hardly be denied—the spiritual descendants of the persecutors are indeed vehement in asserting—that both countries are now honeycombed with atheism. The Spanish Inquisition again, to do it justice, made vigorous efforts to suppress immoral as well as heterodox literature, and what is the present moral condition of Spain? What was it in Blanco White's day, when the Inquisition still survived? Taking it as a mere question of expediency and probable success, to suppress heresy in one nation, while it is rife elsewhere, is like driving doubt out of the door to let it come in again through the windows. And if this holds good of the sixteenth century, it applies with tenfold force to an age of steamboats, railroads, and telegraph wires. In one place indeed at the end of his article Mr. Mallock speaks as though he recognized this difficulty, when he says that the only religion that can legitimately persecute in the future "will be the deliberate and solemn conviction of every one worth considering *in the world*;" but he had throughout the paper spoken of national unanimity only. And if we are to wait till the whole world is agreed in its dogmatic belief, we may perhaps safely postpone the question how to deal with the foolish and fractional remnant of heretics still left, till it requires a practical solution. They must be very sturdy heretics indeed if, under the circumstances, they are worth troubling ourselves about at all.

There are other *lacunæ* in Mr. Mallock's reasoning which might be noticed if our space allowed, but we must content ourselves here with calling attention to one important consideration which he has entirely omitted; and even that must be treated more cursorily than its importance deserves. The omission is the stranger because Mill has dwelt at some length on the point in his essay *On Liberty*, when he argues that one of the worst consequences of the suppression of free discussion, assuming the truth of the protected creed, is the injury done, not to the heretics, but to the faith of the true believers themselves. "Not only the grounds of the [true] opinion are forgotten in the absence of discussion, *but too often the meaning of the opinion itself*. The words which convey it cease to suggest ideas, or suggest only a small portion of those they were originally employed to communicate." Mill proceeds to illustrate this from the moral teachings of Christianity, but it could be quite as easily illustrated from the history of Christian doctrine. Heretical opinions, as he observes—and as all Church history testifies—are often partial truths, or at least partial and neglected aspects of the truth, and to suppress the open avowal of them would tend fatally to obscure the apprehension of that truth. It is no answer to say that Catholicism is the sole and exclusive truth, and the Church its infallible exponent. We are assuming this throughout for argument's sake; but how has the Church all along carried out her infallible exposition of doctrine? By the method of "progression by antagonism." The merest tiro in theological or ecclesiastical lore could have told Mr. Mallock that the history of creeds and definitions from the Nicene creed downwards is the history of heresies. As Dr. Newman puts it, "No doctrine is defined till it is violated;" and therefore if the violation had been rendered impossible there would have been no definition of doctrine at all. No doubt, as Mill goes on to admit, it would be better in itself that all mankind should be united in a true belief; but, even so, it does not follow that every consequence of this unanimous agreement would be beneficial, and he holds reasonably enough that, with our minds constituted as they are, the loss of so important an aid to the intelligent and living apprehension of truth as is supplied by the necessity of restating and defending it from time to time against opponents, "though not sufficient to outweigh, is no trifling drawback from, the benefit of its universal recognition." Meanwhile, we repeat, the actual progress of Catholicism in the world would have been cut short almost at its commencement if the policy of persecution or suppression advocated by Mr. Mallock could have been consistently applied. To cite again an authority that he will respect, "Every exercise of Infallibility," says Dr. Newman, "is brought out into act by an intense and varied operation of the Reason, both as its ally, and *as its opponent*, and provokes again, when it has done its work, a reaction of Reason against it." What is this but to state in other words, and from a different point of view, the same principle which Mill has so powerfully urged against forcible suppression of error in the interests of truth? Indeed the closing words of Mr. Mallock's own paper contain—though he does not perceive it—an implicit condemnation of his thesis. The Church, he tells us, "knows that it must needs be that offences come; but she knows, too, that these offences may work together for good; *nor does she refuse to profit by many that do not follow after her*"—by whom she could not profit if they were silenced or put out of the way. "Whatever is good outside herself"—which successful persecution would put out of existence altogether—"she is capable of taking into herself and assimilating." And therefore, waiving all considerations of justice or mercy towards the heretic, and on the strictest dogmatic principle, persecution stands self-condemned as a treason and injury to the truth it professes to protect.

MR. WHISTLER ON CRITICISM.

A SHORT time ago it was our by no means pleasant task to make some comments on the case of Whistler v. Ruskin, a case the bringing of which into court was for very many reasons to be deplored. Opinions as to its result were naturally more or less divided, and our own has already been recorded; but probably every one who had the least love or care for art was distressed, if not astonished, by the strange want of knowledge, even of the most elementary kind, of the subject displayed by the people chiefly engaged in deciding what ought not to have been, but was allowed to become, the point at issue. As we hinted on the occasion of the trial, neither Judge, counsel, nor jury ought to have been concerned with the artistic value of Mr. Whistler's, or anybody else's, paintings. With that, however, they did concern themselves, and gave their decision upon it according to their lights, or, as some people might say, their darknesses. The trial was brought to a conclusion which cannot have been eminently satisfactory to any one interested in it, and it might have been hoped that the last had been heard of it. Its after effects, however, were soon shown in Mr. Ruskin's resignation of his Oxford Professorship, a proceeding which seems to savour somewhat of cutting off one's nose to spite one's face, and in a subscription got up by his most devoted admirers to defray his costs in the action—a proceeding which was perhaps somewhat unnecessary. These circumstances may possibly have had something to do with urging Mr. Whistler to an ill-advised attempt at correcting in public estimation the impression which might have been produced by the verdict of the jury. Twelve men who, as far as one could judge, knew nothing whatever of art had said by implication that Mr. Whistler's productions deserved all the abuse that Mr. Ruskin had poured upon them, although Mr. Ruskin might with advantage have expressed himself in more moderate terms; and enough men to form a subscription list had thought that Mr. Ruskin was an injured person, because some kind of limitation was applied to the violence of his invective. Mr. Whistler, unmindful of the old proverb μὴ κινεῖ Καμαρίναν, was so disturbed by this condition of things that he laid aside his brush, and took up his pen to produce a pamphlet which he calls *Art and Art Critics*.

We objected when we treated of this subject before to the tone which Mr. Ruskin thought himself privileged to assume with regard to Mr. Whistler. We find ourselves compelled to object as strongly to that which Mr. Whistler has thought fit to take in his pamphlet. It is true that in Mr. Ruskin's case the deviation from ordinary paths was a matter of some moment, because Mr. Ruskin, whatever may be thought of his views, is undoubtedly a considerable writer; whereas Mr. Whistler's performance can scarcely be called a deviation at all, as Mr. Whistler is no writer at all. But Mr. Whistler has, in his own way, done his best to rival Mr. Ruskin.

Mr. Whistler, filled no doubt with a due sense of the importance of his subject, plunges at once into the very middle of it with this startling sentence:—"The *fin mot* and spirit of this matter seems to have been utterly missed, or perhaps willingly winked at, by the journals in their comments." Pausing merely for a moment to inquire how a *fin mot* can possibly be winked at by the comment of a journal, we may at once congratulate Mr. Whistler upon the extraordinary linguistic skill which his work displays. In the limit of sixteen pages of wide print, with about twenty-two lines to a page, he has managed to give us no less than forty-three words of the French and one of the Latin tongue. What the author means by his complaint that the journals in their comments winked at the *fin mot* of his action against Mr. Ruskin is explained by the following sentence. The writers, it seems, "not unnaturally," Mr. Whistler generously and vaguely admits, "as writers," saw nothing beyond the immediate case—" namely, the difference between Mr. Ruskin and myself, culminating in the libel with a verdict for the plaintiff." We do not quite see how a difference can culminate in a libel with a verdict; but that perhaps does not matter very much. Precisely what was complained of at the time of trial was the fact that everybody engaged in the case did see "beyond the immediate case in law," and imported into it a quantity of extraneous matter. With this quantity, however, Mr. Whistler was dissatisfied. He regards the trial, which, as he says with exact truth, ended "with a verdict for the plaintiff," as merely the opening skirmish of a great war between "the Brush and the Pen," which "involves literally, as the Attorney-General himself hinted, the absolute *raison d'être* of the critic." Mr. Whistler goes on to say that the Attorney-General over and over again in the course of the trial cried out, "What is to become of painting if the critics withhold their lash?" and on this not very wise utterance he makes the equally unwise comment, "As well might he ask what is to become of mathematics under similar conditions—were they possible. I maintain that two and two the mathematician would continue to make four, in spite of the whine of the amateur for three, or the cry of the critic for five." We can believe, without Mr. Whistler's maintenance of the fact, that "the mathematician" and everybody else will always find two and two make four under present conditions; but we do not believe, however much Mr. Whistler may maintain it, the proposition inferred by his simile, that painting is to be ranked as an exact science. If it were, Mr. Whistler's own paintings would perhaps have less chance of success than they have now. The writer goes on to observe that one result of Mr. Ruskin's having devoted his long life to art was his being Slade Professor at Oxford, and by this reflection he is inspired to make some remarks which are curious enough to be worth quoting in full, and to which we would call special attention:—"It suffices not, Messieurs; a life passed among pictures makes not a painter"—as far as we know, no one ever said that it did—"else the policeman in the National Gallery might assert himself. As well allege that he who lives in a library must needs die a poet. Let not Mr. Ruskin flatter himself that more education makes the difference between himself and the policeman when both stand gazing in the same gallery! There they might remain till the end of time; the one decently, the other saying, in good English, many high-sounding empty things, like the crackling of thorns under a pot—undismayed by the presence of the Masters, with whose names he is sacrilegiously familiar; whose intentions he interprets, whose vices he discovers with the facility of the incapable, and whose virtues he descants upon with a verbosity and flow of language that would, could he hear it, give Titian the same shock of surprise that was Balaam's when the first great critic proffered his opinion."

The taste of this wonderful passage speaks for itself, and fully bears out our assertion that Mr. Whistler has done his best to rival his opponent in the use of hard words. Little less strange is its meaning when unravelled. Stripped of its sprouts and flourishes, what the writer has said amounts to this. Mr. Ruskin is not to suppose, because he has devoted his life to the study of pictures, and a policeman in the National Gallery has, for the purpose of the argument, not done so, that he is capable of appreciating the pictures in the Gallery one whit better than the policeman. If the truth both of this and of Mr. Whistler's previous argument is admitted, it must be manifest that Professor Sylvester is not to suppose, because he has devoted his life to the study of mathematics, that he knows any more about space of four dimensions than does the porter of his lecture-room. Probably Mr. Whistler would not wish to push his comparison of painting to mathematics so far as this. In the second part of the passage which we have quoted we learn that it is sacrilegious for Mr. Ruskin to be familiar with the names of the great masters; that, although he writes good English, his verbosity would shock Titian; and that, by inference, Mr. Ruskin may be written down an ass. In some twenty lines Mr. Whistler has managed to compress as much nonsense as most people would get into a whole pamphlet.

The critic, we are further informed, is a creature of modern growth. He is best developed in Paris. The English critic has a "horror of *ennuyer*'ing the world"; he has not "the *savoir plaire* and *finesse*" of the Frenchman, and he is lacking in various other qualities, which are indicated in a perfect shower of French words picked up and thrown down again at haphazard. With the same exquisite taste that belongs to the extract we have given, the writer goes on to refer to a well-known critic by the name of "Tough Old Tom," and then, after several more lines of verbiage, tells us at length what the object—the *fin mot*, we suppose he would call it—of his pamphlet is; and it must be admitted that it has at least the unexpected merit of being simple and easily understood. Mr. Whistler would abolish all art criticism. No notice whatever should be taken of painters by writers. "No!" cries the author in a burst of eloquence, "let there be no critics! they are not a necessary evil, but an evil quite unnecessary, though an evil certainly. Harm they do, and not good. Furnished as they are with the means of furthering their foolishness, they spread prejudice abroad; and through the papers at their service thousands are warned against the work they have yet to look upon." Mr. Whistler conveniently forgets that there is another side to the question; that but for this "furthering of foolishness," which so exercises him, his own works might have failed to get the attention they have; and that but for the existence of such people as those whom he chooses to call "Ruskin" and "Colvin," numbers of persons who have learnt to enjoy works of art might still see no difference between a village signboard and a Titian. But that, of course, would be a matter of small importance so long as Mr. Whistler's works ran no risk of being condemned by a person whom he thought incompetent to judge them. To painters, it appears, and to painters only upon the "who drives fat oxen" principle, he would allow some voice in deciding upon the merit of other painters' works; but as what they said would never be published, it would do but little harm or good. The public would, if the world were ordered according to Mr. Whistler's fancy, wander through picture galleries without any aid from the friendly sign-posts which critics have been accustomed to set up; and each member of it would form his own opinion, unaided and untrammelled by any advice or information save that which a painter might be disposed to give concerning his own or his rivals' performances. No one except painters would any longer affect to possess taste, and the Slade Professorships at Oxford and Cambridge would be taken away from people whose only claim to them rests upon their deep and laborious study of art; and would be given, it is to be presumed, to Mr. Whistler or some equally deserving painter.

We have now, we think, given the cream of Mr. Whistler's work, and our readers can judge of its value for themselves. For our own part, we would not be rash enough to say of any pamphlet that it was the silliest ever produced, but Mr. Whistler's certainly is not the wisest we have seen. As to his scheme of reform, we would suggest that, as all great undertakings must have small

beginnings, Mr. Whistler might in the first instance make an experiment on himself. Let him open a gallery for the exhibition of his own paintings, send special requests to all art-critics to "receive his work in silence," and remain in constant readiness himself to instruct the crowds who will doubtless throng to visit him.

LOTTERIES.

IN a few days the great Paris lottery will probably be drawn. There will be for some people an end of a period of much anxiety, and the unfortunate Commissioners will feel that they are their own men again. They have lived a weary life for these many days, and have had no reward, not even that of an approving conscience. The position of a gentleman who should be sentenced for some unusual crime to three months' confinement in the Civil Service Stores would be comparatively endurable. The Commissioners have had to ponder over the laws of chance, and over the distribution of jars of pickles; they have assorted into lots, tallow, sardines, pianos, vases, stoves, bicycles, steel pens, diamonds, patent manures, fly-hooks, billiard cues, paving-stones, mangles, and so forth. Their experience has been a prolonged nightmare of Industrialism, and they must almost wish to revert to the state of nature. All the merchants, manufacturers, journalists, artisans, gossips, charlatans, and gamblers of the round world have offered them raw material, swimming lessons by way of prizes, machinery, advice, sermons, expostulation, ridicule, and pity. They have been the centre of the thoughts of every speculative rascal in Christendom. Dozens of plans for circumventing them have been considered, of which the simplest is to forge copies of all the tickets of all the series, and send in those which correspond to the winning numbers. The expense of this operation would be almost infinitesimal compared with the pleasure and profit of success. If many persons have tried it, the labours of the Commissioners may last for years. Each ticket will have to be compared with its torn half in the possession of the Commissioners. The plan of "getting at" the wheel and its manipulators is less enticing; and even the big prize of diamonds would scarcely make the game worth the risking.

While the gentlemen who work the lottery for their country's good are thus driven and distracted, they do not escape the attacks of British and foreign moralists. These persons have spied the obvious prey, and have darted on the poor lottery with much alacrity. "What! a Republic, and encouraging gambling!" they have screamed; and have quoted the opinions of Montesquieu, M. Thiers, and other ascetics. It is certain that many knaves are likely to try to turn a dishonest penny by aid of the lottery; but then, the more genial critic may say, if the knaves were not "operating" in lottery tickets, they would be busy on 'Change or practising *chantage* in the "society" journals, English and French, to which they have access, or in some other manner waging war on their fellow-creatures. The lottery is only a big tombola, with which France, like her own strolling players and singers, winds up her show. The great performance is over, there are a number of objects left on hand which no sensible person would care to purchase, or greatly delight to receive as a gift; but he will risk his franc for the fun of the thing, and smile alike over a blank or a prize of the order of the White Elephant. That is scarcely too indulgent a view of the matter, if we leave out of sight the impulse which the lottery may possibly give to gambling in general. Now the French are by nature a somewhat gamblesome people. The State has suppressed all the public houses of roulette, save that at Monte Carlo, which it cannot touch. The genius of the nation consoles itself with the fascinating *baccarat*, in private houses and in clubs. The superstition of the gambler is unchecked, and bits of the rope with which a suicide has ended his days, are eagerly competed for. *Baccarat* probably causes as many misfortunes in France as racing does in England, and *baccarat* does not improve the breed of horses. But no one surely would therefore wish to fine or imprison the grinning Spanish pedlars who set up their little wheels of fortune in the street, and offer the spirited public a chance of winning twenty bad cigars for a sou. If you stake on the anchor, and the mystic needle pauses over the anchor, you may win quite a pocketful of weeds. The French lottery, with the low-priced tickets and the vast proportion of absurd and useless, not to say inconvenient, prizes, might be as harmless as the wheel of fortune at the street corner. How can people back their luck more cheaply? There is a redeeming humour in the proportion of prizes that are worse than blanks. Society is set to play at a huge round game, where surely no one misses the trifling stake. A duchess may draw the mangle, a washerwoman the diamonds, an archbishop the twenty-four lessons in the art of swimming. Provided people would not argue, "If the Republic has a lottery, I may set up a bank at roulette in the back-shop," there would be little harm done.

The moralists who denounce lotteries—and lotteries of the evil old financial sort they denounce with justice—are always eager to prove that the purchasers of tickets make a bad bargain. A very ingenious writer in the *Cornhill Magazine* shows that instead of fifteen times his stake (let us say), the lucky speculator should receive eighteen times his stake. If there were a competition among lotteries of the Geneva sort, no doubt people would flock to the managers who gave the longest odds. There is, happily, no competition, and people pay a larger price for their excitement. It is for excitement they pay, far more than for the bare chance of winning. A sane man may hold that three months' day-dreams about winning a large set of diamonds are worth tenpence. Really the thing seems inordinately cheap. Of course when it comes to a whole populace spending all its time and most of its money in dreams, that is the hour for morality to step in. "This mental opium-eating of the Romans," the British moralist might have said to His Holiness the Pope, when Rome was mad about lotteries, "is a very disastrous state of mind." The wily ecclesiastic might have referred, in reply, to a flourishing branch of our own trade with China; but that would be a mere *argumentum ad hominem*. Certainly a life like that led by the small speculators who used to look on every phenomenon of existence as a guide to lucky numbers was too empty, useless, and fantastic. Eternal hope gilded their idleness, but we do not propose to defend State lotteries. We are merely anxious to show what people pay their money for—namely, for the power of indulging in dreams not absolutely outside the possibility of becoming realities. To people in this humour a greater or less percentage of certain loss is unimportant. According to the writer in the *Cornhill*, the Russian Government once invented a scheme that went too far even for the credulity of a semi-barbarous people. No one would play at the Czar's little game. That, at least, is the way in which we prefer to view the failure of the Russian lottery, though the writer has a scientific explanation. Instead of drawing numbers from a wheel, the great White Czar proposed to his people the pastime of pitch-and-toss. "The tossing of a coin was to decide the prize to be paid, and there were to be no blanks." If "head" came up on the first toss, the Czar handed over 2*l.*; if it did not come till second toss, 4*l.*; if tails came up three times running, 8*l.*, and so on. The diversion never passed beyond the region of dreams. No historical painter can ever design, in the frescoes of a Muscovite St. Sophia, a divine figure from the North in a halo and jack-boots, tossing up with a mougik. The mathematicians who had to calculate the price to be paid for tickets decided that the price would be—infinite. "The just value of a chance is greater than any sum which can be named." The truth of this statement may be demonstrated by mathematics, but it seems an uncommonly unlikely story, not to say absurd. The autocrat probably found, as a matter of fact, that the untutored mougik, though not a very suspicious character, knew rather better than to toss. The mougik had been at the Nijni Novgorod fair, no doubt, and had examined the practical problem of the thimbles and the pea. He had broken his wits on the three-card trick, and had learned that some kopecks have heads on both sides, while others are no less bountifully provided with tails. Thus we may assume that even the ruder denizens of Russia, as the Tshuvash, the Tsheremis, the Patzinak, the Yatshving, the Mordvian, and the rest, were too expert in the world and its ways to toss with the Czar. An autocrat who offers you a handful of roubles whether you win or lose is an autocrat who puts himself in a suspicious position. He would do better to imitate the stratagem of William Rufus, who once called the forces of the kingdom together, as if for war, and then took their pocket-money and let them go. With a militia of seven hundred thousand men that plan might not be a bad one for a Muscovite financier to try—just once. As things stood the great lottery swindle failed, for obvious reasons, and then the Government gave out that their offer was too good, that mathematicians declared the value of their tickets to be "infinite." Even the writer in the *Cornhill*, who presents his readers with some hopelessly elaborate and plausible calculations, admits that "the result of the mathematical inquiry seems, on the face of it, absurd."

The real attraction of lotteries, next to their power of producing the dreamy, delicious state of mind we have described (a state of mind in which the idea of labour seems ridiculous), is their connexion with the mysteries of chance. We are almost all mathematicians, as far as these laws go, though the truly popular mode of approaching the problems is doubtless simpler than the methods of De Morgan or D'Alembert. These men of genius would patiently calculate the chances against a quintuple event, a *quine determiné* coming off. The odds, then, that you do not name five numbers out of ninety, in the order in which they will be drawn, are 5274772160. The popular speculator's method is simple; he counts the number, say, in five successive droves of pigs that he meets on the road, and they make 8, 21, 19, 31, 15. At once he goes off and stakes a couple of sous on this arrangement. He bets that out of ninety possible numbers the five drawn, and the order of their drawing will be as the numbers of the five droves of pigs. He does not win, he never has won, but a player who staked two sous did once select all the five numbers, though not in due order. He only won about 5,000*l.* for his two coppers. The pleasure of staking in lotteries, then, and of roulette, combines something like the sensuous joy of opium-smoking with something like a short cut to the pastime of the higher mathematics. On the whole, it is as well that the natives of this country seldom have a good chance of revelling in these luxuries. The friends of the City of Glasgow shareholders are ill-advised when they propose to raise money for them by a lottery. Charity goes ill with these speculations, and the quality of pity is transmuted into the baser metal of greed or the indolence of day-dreaming.

BIBLIOMANIA IN 1878.

EXCEPT perhaps doctors and dentists, no class seems to be so little affected by general commercial depression as the persons who minister to what are commonly called "tastes." Let the money market be ever so tight, trade ever so bad, the Stock Exchange barometer ever so low, there is never any "dulness" at a bric-a-brac sale. Old china, especially if it is cracked, is always "firm," and "liveliness" seems to be the unfailing characteristic of autographs, fans, Cremona fiddles, Louis Quatorze snuff-boxes, and the like, however sluggish pig-iron and madapolams may be. The explanation is of course a very simple one. A taste is a visitation, as Pope describes it, or, as our modern rationalistic phraseology puts it, a mania, and, being in the nature of a disease, is despotic. If your liver is congested, whatever reasons you may have for economizing, you must fee the doctor; if your tooth gives you no rest you must have it out or stopped, no matter how unsatisfactory the state of your banker's book may be; and it is apparently the same with a taste. If old Worcester or Wedgwood, or anything else that excites it comes into the market, the sufferer has no choice. The irritation must be allayed at any cost. We have no right, therefore, to be astonished at that disproportion between the prices paid and the intrinsic value of the articles sold which is often such a striking feature at a collector's sale. With half-a-dozen competitors, all labouring under the same ailment, there is really nothing short of insolvency to limit the sum which any object may fetch. There are few finer fields for gambling than the traffic in objects of taste. A thing may bring many hundreds per cent. on its original cost, or be worth nothing, just as it chances to attract the current taste or not. And this suggests a question which is well worth considering—namely, whether tastes may be artificially propagated; for, if so, a very profitable industry is open to practitioners possessed of the requisite enterprise and patience. What is there to prevent two or three smart speculators from buying up all the available specimens of some particular article—old toothpicks, let us say, for example; and then adroitly creating a toothpick taste? They would thus form a kind of toothpick "ring," and infallibly turn into their own pockets the property of the unfortunate victims of the toothpick taste, who would be completely at their mercy. We trust that any respectable psychologist, discovering the process by which this might be effected, would be humane enough to keep the secret to himself.

A pamphlet published lately in Brussels gives some facts and figures which might be of use in an attempt to measure the force of taste. It is called "*La Bibliomanie en* 1878, par Philomneste Junior," and it passes in review the more notable transactions in choice books, and some three or four of the most remarkable book-sales of the past year. Of all the manias there is none that has so much to say for itself as bibliomania. The rational bibliomaniac—if the phrase may be used without perpetrating a bull—is a useful man in his generation. It is to him that scholars are indebted for the preservation of the materials they work with. It is his dearly-bought knowledge that saves many a piece of literature from perdition, rescues many an old author on the brink of oblivion, and enriches national libraries with their most precious treasures. But the varieties of the bibliomaniac are as many and diverse as those of the dog. There is the first-edition man, whose craze is by no means the useless and frivolous one which the outer world is apt to consider it. There is the choice-edition man; and the early-press man, to whom the printer is an infinitely more important personage than the author; and the rarity man, in whose estimation a unique spelling-book ranks above a first folio Shakspeare. And then there is the whole category of specialists; and probably there is no class of books, from bibles to almanacs, that has not its special devotees. Of late years, however, a new variety of bibliomaniac has come into existence. The protection and external ornamentation of books have always been matters of importance in the eyes of the bibliophile; though of course there have been, and are, those who take a rigidly utilitarian view of binding, and profess something like a Spartan contempt for the luxury of decoration. But in these latter days binding, from being a secondary consideration, has contrived to push itself into the first place; and, to judge by the records of sales and the catalogues of booksellers, the first question—in France, at least—about any volume is, "Who was the binder, and how has he bound it?"; next, "What is the book?" but this latter only when the former has been satisfactorily answered. To say that the value of a book is raised a hundredfold by the fact that its binding is the work of some recognized artist gives no idea of the part which binding plays in the bibliomania of this new sect. A better illustration is furnished by the fact of a book, which as a book is valueless, selling for about 25*l.* because it has been bound by Padeloup, as in the case of the *Réflexions des Saints Pères*, sold to MM. Morgand et Fatout at the Payne sale in April last. Indeed there is no reason why it should be a book at all; provided it is splendidly dressed, it may be a dummy—like Horace's actor—

> Dixit adhuc aliquid? Nil sane. Quid placet ergo?
> Lana Tarentino violas imitata veneno.

It somewhat justifies the apprehensions expressed just now about the artificial production of manias to find that, according to "Philomneste, Junior," M. Brunet, the author of the *Manuel du Libraire*, had at least a great deal to do with the first outbreak of this "douce manie," as the pamphlet tenderly calls it. Whether he wilfully inoculated himself, or took it naturally, there seems to be little doubt that the virus first showed itself in a pronounced form in his case at the Parison sale in 1853, when, after what Philomneste calls a "lutte acharnée," he carried off a *Télémaque* at the price of 1,700 francs—and that not even an original or choice edition of that thrilling romance, but simply a copy distinguished by the Longepierre stamp, now nearly as great an object of worship as the Grolier. Fifteen years later the same copy fetched 500 francs more, and when last observed it was quoted in one of M. Fontaine's catalogues at 4,000 francs; for it must be remembered books of this sort are watched, and each reappearance in public is noted with the same care as astronomers bestow upon Halley's or Donati's comet. Its original cost to M. Parison was 36 francs. Another example of what the Longepierre "insignes" can do for a book is a 1669 Montaigne, an edition of no special value in any way, either as an original, or a rarity, or an authority, which we have seen put at a guinea in the catalogue of a great London dealer, but which in this instance is rated at 6,000 francs by MM. Morgand et Fatout because of the *toison d'or* impressed on the back and sides. In these cases the charm of the binding lies partly in its pedigree, so to speak. As an instance of the power of binding, pure and simple, we may take M. Brunet's copy of the "Fermiers généraux" edition of the *Contes* of La Fontaine, bound by Derome, and by some held to be his *chef d'œuvre*. It cost M. Brunet 675 francs; it fetched 7,100 at his sale, 10,000 shortly afterwards, and finally reached 13,000 francs. "Sera-ce le dernier mot? nous ne le croyons pas," says "Philomneste Junior"; and indeed he would be a bold man who, with such examples before him, would fix any limit to the extravagance of this bibliomania, or, to be more correct, this pegimania, for, in truth, the *book* has nothing to do with it. The part which the book plays in the transaction is very clearly shown in the last-mentioned instance. The "Fermiers généraux" edition of the *Contes* is a very well-known book in bibliography, and commands a high and of course rapidly increasing price. Twenty years ago it might have been had in fair condition, and with its proper complement of improper plates, for two or three guineas in this country; nowadays good copies would fetch about ten times as much (a "*superbe exemplaire*," also in a Derome binding, is put at 1,200 francs in MM. Morgand et Fatout's Catalogue for 1878); so that at the last sale of the Brunet copy above-mentioned the purchaser paid something like 500*l.* for a special example of Derome's binding on two little duodecimo volumes. The book is of course a valuable one, or it would not have had Derome's best skill exerted upon it; but its value bears just about the same proportion to the price as the value of the rough block of pure marble bears to the sum paid to Gibson or Story for the finished statue. Jonathan Oldbuck would find his favourite story about Caxton's "Game of the Chesse" fall very flat if he lived in these days.

Derome is by no means the only one of the older bookbinders whose work is sought for with this frenzied eagerness. There are many other names, such as Le Gascon, Du Seuil, Thouvenin, Padeloup, Boyet, any one of which is sufficient to raise wild biddings in the Rue Drouot. But Derome seems, on the whole, to have the call; and, seeing what any bit of his workmanship brings now, one feels almost awe-stricken at the idea of the sum which a library, like that of Mr. Paris, mainly bound by him, would fetch by auction at present. This collection, which was sold in 1791, comprised 636 articles, and brought 7,095*l.*—an enormous sum in those days. To think of what it would bring now is like trying to contemplate the number of the constituents of the Milky Way, or to calculate the progeny of a pair of healthy herrings at the end of ten years, or to work any other problem in which mental arithmetic is confounded in the attempt to grapple with immensity. One slight clue we have, but it is not much to trust to. At the Paris sale a copy of Pine's Horace, London, 1733, the "right" edition—that which has the wrong spelling of the word "potest"—sold for 6*l.* 10*s.*, while at the Turner sale, in March last, a copy in a very similar binding brought 5,000 francs; but the latter does not appear to have been a Derome.

Among the bindings of the present day the Trautz-Bauzonnet work holds somewhat the same place that is held by Derome's among those of the past. There are plenty of first-class artists—Lortic, Thibaron, Hardy, Chambolle, and many others—whose workmanship outside a book will make it ten or twenty times as desirable as it would have been in some ordinary, obscure binding. But for stirring up a veritable *lutte acharnée* about a book, or giving it a catalogue appraisement which seems to have come from Bedlam or the Bicêtre, there is nothing like what Philomneste calls the "nom magique" of Trautz-Bauzonnet. Scarcity, always a potent influence in manias, will in a great measure account for this, for it is said that about two hundred volumes per annum is the maximum produce of the artists' *atelier*; but no one with any taste or judgment in the matter of bookbinding will deny the great merits of M. Trautz-Bauzonnet's work. In all that is included in the term "finish" it is perfect, and of its efficiency as regards what should be the main end of binding there can be no doubt. The sturdy bindings of Roger Payne are not better adapted to insure the life of a volume than the elegant *reliures* of Trautz-Bauzonnet. If they have a fault it is one common to the whole school of modern French binding, which, as is pointed out in a pamphlet on the "Decoration of Books" just issued by MM. Marius Michel, "relieurs-doreurs," is too much given to servile reproduction of the work of the seventeenth and eighteenth century binders, and too regardless of the pro-

prieties of binding. "On voit avec étonnement le Roy Arthus ou Tristan de Leonnois dans le pourpoint de Louis XIV, et Rabelais ou Ronsard dans la jupe à fleurs de Madame Deshoulières"—which is very much what was said about modern French binding in these columns some time back. This is only what might be expected from the position which the Parisian bookbinders have been encouraged of late to assume. With them evidently the *raison d'être* of a book is to be bound by their hands, and if its age, style, or character does not harmonize with the binding they choose to give it—why, *tant pis pour le livre*. One consequence of this craze is beginning to manifest itself already. "Libraries" or "collections" of books are becoming rarer every day in France. In the first place, none but a millionnaire could put together anything deserving the name of even a collection on the terms which the new fashion dictates; and then, as the books are for show, not for use, their numbers and their arrangement must be considered with a view to that end alone. Consequently at the Hôtel des Commissaires-Priseurs in the Rue Drouot one never hears now of a library being put up for sale. It is always the "cabinet" of M. So-and-So; indeed MM. Morgand et Fatout go a step further and speak of the "musée" of an eminent bibliophile. The tendency is thus to rob the insanity of the bibliomaniac of its one redeeming feature. His function in the economy of society is to act as a feeder to our national and public libraries, and it is to this end that he has been endowed with his peculiar acquisitive instincts. He may not be a scholar or a student, but his perseverance in collecting and preserving the things which scholars and students require make him in his way a useful servant to literature and learning. Let these valuable instincts of his be directed into such a channel as the binding mania, and he becomes a less estimable, because a more extravagant, maniac than the cracked-china-man or the postage-stamp collector.

It is not to be supposed, of course, that French bibliomania spends its whole force on binding. The early or original editions of the French classics, but above all of the dramatists, are pursued with an ardour which, if excessive, is at least more intelligible to the outer world. Thus at the Didot sale in June the six volumes of Corneille, 1664-6, brought 14,400 francs. The same copy at the Bertin sale sold for 140 francs. Racine, the first collective edition of 1676, fetched only 2,000 francs; but M. Fontaine rates a copy at 5,000 francs, and MM. Morgand et Fatout ask 6,000 francs for a copy of the corresponding edition of Molière published in 1666. Single plays of Molière in original editions go at proportionate prices. At the Didot sale the *Plaisirs de l'Isle enchantée* fetched 4,500 francs, and, judging by catalogues, it would seem that 100*l*. is "a cheap pennyworth," as Swift would have said, for the first editions, one with another. Not less eager is the pursuit of books illustrated by the dapper eighteenth-century artists, Eisen, Gravelot, Moreau, &c. In these, as Philomneste says, "les gravures son tout, le texte ne compte pas"; and what the engravings can do is shown by the 10,000 francs paid lately for the *Temple de Gnide* with the Moreau plates. Books, too, with a *blason authentique*, like the Longepierre *Télémaque* already mentioned, tracing a descent from famous collectors, Grolier, de Thou, d'Hoym, or, better still, from "reines de la main gauche," like Mme. de Pompadour or Mme. du Barry—these, nowadays, "valent leur poids en or." But book-madness in France is anything but catholic in its leanings just now. It runs in two or three grooves only, and those very narrow ones. Nothing that is not in some way French seems to have any attraction for it, nor does it appear to have any kind of literary sympathy with books. A very significant fact is that the Greek and Latin classics in the choicest editions, unless indeed they have the good luck to be in Derome or Trautz-Bauzonnet bindings, are not looked at by the bibliomanes of the period. Thus at the Payne sale Mr. Quaritch was able to carry off for about 20*l*. the famous Elzevir Cæsar of 1635—of course the "right" edition, the one which is wrong in the numbering of pages 149 and 335; a book which many connoisseurs hold to be the *chef d'œuvre* of the Elzevirs, and at any rate a very beautiful and very rare volume; and no ordinary copy either, but Renouard's own exemplar, the second finest known, and barely a millimètre less "tall" than the illustrious copy in the Bibliothèque Nationale.

In the preface to their catalogue, already more than once quoted —in itself, by the way, a bibliographical treasure—MM. Morgand et Fatout venture some speculations on the future of bibliomania in France. Of course they do not say in so many words that the present rage for binding and illustration is a mere evanescent fashion. As bibliopoles, they must go with the tide of fashion, and it will not do to depreciate a fashionable stock; but they plainly have no faith in its permanence. They think, however, that the early editions of the Greek and Latin classics have had their day, and will be in demand only with the "savants de profession." On the other hand, in their opinion, the original editions of the French classics, more especially the moralists, the poets, and the dramatists—Montaigne, Pascal, Malherbe, Regnier, Boileau, Corneille, Molière, Racine, and the like—are certain to rise in value every year, and these, they think, are the game that amateurs, ambitious of forming a valuable collection, should pursue. But they must look sharp about it, *il faut se hâter*; fine copies are growing scarcer every day. Ten years ago the pursuit, entered upon with due knowledge and judgment, was by no means a bad speculation commercially. The small collection of M. Quentin Bauchard, the formation of which cost 30,000 francs, and occupied barely eight years, sold for no less than 154,569 francs, a tolerably remunerative rate of interest on the capital invested. But those days have gone by. The holders of choice books know their value too well. There is no cheap market now to buy in, no bargains to be made, and "le temps des bonnes fortunes est passé pour les libraires."

DIFFICULTIES OF FREE-TRADE.

THERE can be no doubt that the present is a critical time for the principles of Free-trade. The powerful wave of Free-trade feeling in England which at once caused the abolition of the Corn-laws and derived irresistible force from that abolition has met the strong normal Protectionist tendencies of foreign States and of our own colonies, and is recoiling from the impact. That Free-trade will ultimately prevail, as being indisputably the right course, is a belief which we certainly cannot permit ourselves to hold to be doubtful. But prevail easily it will not; and if under the present commercial distress the action of England can be kept sound, it is perhaps as much as can be looked forward to with any confidence. Protection is the last straw at which a body of merchants or manufacturers who see their trade slipping away from them can catch; and catch at it they certainly will sooner than run the risk of bankruptcy, however clearly it may be demonstrated that the course they advocate would be detrimental to the country at large. While, then, there is probably not much need to be afraid of a return to Protection in any degree, as far as England is concerned, the case is one in which an accurate statement of arguments can by no means be considered lost labour. And while the beneficial results of Free-trade may be more or less shown from several points of view, the chief aim of believers in Free-trade ought to be to seize the Protectionist argument as it is urged by its adherents, and meet them on their own ground. The more general grounds are, however, to be stated in the first instance.

Free-trade, as regarded by persons who, being unconnected practically with trade, occupy an impartial position towards the question, recommends itself by its evident equity. Why should any man be prevented from buying the article he has a fancy for from any man who undertakes to supply it? If the article is dangerous to the life or well-being of others, good; the ground for interference is real. If a Government is in need of money, then again the welfare of society may require that it should obtain the money by means of an import duty. But what reason can be given beside these two? How is it equitable that Robinson, an American citizen, should be compelled by his Government to pay thirty-five per cent. more for the iron which he wants for his own purposes, simply in order that Jones, another American citizen, may be enabled to sell his iron at a profit? Is this not robbing Peter in order to give to Paul? This is essentially the ground on which the Corn-laws were overthrown in England. But, strong though it is as an argumentative ground, it would have been of no avail had it not been for one further circumstance, too little noticed by Free-traders. The consumers of corn were, for once, so deeply and injuriously affected by the Protectionist laws that a common feeling united them in opposition to those laws; and against such united opposition the imagined interests of the producers of corn had no chance whatever. The Protectionist cause, in such a crisis, was like a sea-wall prostrated by one huge storm-wave. The same amount of force might have been brought to bear against it by a thousand lesser waves without any result being produced; it was the momentum of the single impact that did the work. The reasonableness of the argument against Protection grounded on the interests of the consumers would not have moved the Legislature to abolish the Corn-laws, had not the consumers lent an impulsive force towards the abolition such as no Legislature could withstand.

But this union on the part of the consumers, which was accomplished in England at that particular time, is a condition which can never be depended upon in general. The strength of Protection lies in this fact—that producers in any line can combine with the greatest ease for any interest which they have in common; whereas the consumers seldom can do so. The consumers are scattered, and are unable even to know each other's whereabouts; there is no obvious mark or token by which they can recognize one another. The producers have not the smallest difficulty in communicating with each other. Thus the producers, as against the consumers, have the advantage which a small European army has against a host of Asiatics. It is perfectly useless for a single buyer of iron or cloth to appeal to his Government on the score of the dearness of the things for which he has to pay; but, if fifty ironmasters or cloth manufacturers combine to represent the distress which will fall on them and their workmen should their business fail, the effect produced is not small. Equity, as seen by the impartial political economist, becomes blurred and dim when the two sides are so unequally represented as is the case here. Nor should the imposing sound of the pretension to foster the trade of a country be thought of no account. A statesman would generally better like to have it said of him that he had increased the value of the trade of the country than that he had abolished taxes. There is something more positive about the former performance. Cheap goods is not so animating a cry as the enlargement of commerce.

Further, while the union of consumers is the greatest force that can be brought to bear in favour of Free-trade, and should therefore by all means be sought for, it is by no means clear that

the superiority of the claims of the consumers to the claims of the producers is capable of being demonstrated in a legislative assembly in such a way as to insure general conviction. It is true that the consumers have a claim not to be dispossessed of their just right of buying where they please, which in equity is absolute. But in the heat of popular discussion this claim runs a great chance of not being heard against the representation that it is for the national interest that the consumer should buy of his own countrymen. The thesis is plausible that the Legislature has to guard neither cosmopolitan nor individual interests, but national interests. More especially is this the case at an era of distress like the present. And the most direct way of meeting the Protectionist case is, not by weighing the balance of advantages, but by disproving the very point of their contention—namely, that Protection is really for the interests of the producers of a country taken altogether.

The ordinary disproof of this—the core of the Protectionist position—in works on political economy is by showing that, as the capital of the country is limited, it will be employed with less efficiency on any branch of production which is so intrinsically weak as not to be able to stand without special extraneous assistance than it would be if trade were free. This is a perfectly sound argument; but an additional point has been put on it by Professor Bonamy Price in his recent work, *Practical Political Economy*, in a passage of much force, which it will be worth while to quote (the italics are our own):—

> All trade is an exchange of equivalent values or services. This is the very essence of trade. Trade always exacts as much as it gives away. . . . To buy is to give away your property in exchange for the goods bought; and to give away property for other property is precisely the act of selling. Every nation, therefore, which buys sells also, and sells to the full value of what it buys. . . . The truth stands out in clear sunshine. Free-trade cannot and does not injure domestic industry. *Under Free-trade foreign countries give in every case as much employment to English workmen and English capitalists as if nothing had been bought abroad.* English goods of the same value must be purchased by the foreigner, or the trade comes to an end. There must be an equal amount of English goods made and sent away, or England will never obtain the foreign commodities. Free-trade never does harm to the country which practises it; and that mighty fact alone kills Protection. Let those who are backsliding into Protection be asked for a categorical answer to the question—*Can and will the foreigner give away his goods to any country without insisting on receiving back, directly or indirectly, an equal quantity of that country's goods?* Let the question be pushed home, and all talk about injury to domestic industry must cease.

The very heart of the Protectionist position is pierced by this passage. But one observation must be made upon it. Protection fosters certain industries, and, as we see, necessarily discourages other industries, and discourages them in a greater degree than it fosters the favoured trades. But there is this great difference between the trades which are favoured and those which are disfavoured by Protection; the trades which are favoured are known, and can be pointed out; the trades which are disfavoured cannot by any means be so easily pointed out. If laws are passed in America for the protection of the American ironmasters, every one knows that the American iron trade has received a certain stimulus by this action of their Government; but what goods they are that would have been sent from America to purchase English iron, had the American iron trade not been protected—which goods cannot now be made for want of a market in England—this is altogether uncertain. Here, again, the practical advantage which the Protectionists derive from their position is apparent. It can be shown by irresistible abstract reasoning that the whole body of producers in a country are not benefited by Protection; but, in the attempt to exemplify this reasoning by actual instances, the injury which is done cannot, from the nature of the case, be fixed accurately.

If these reasonings are correct, the line which Free-traders ought to take in showing the evils of Protection is twofold. The pretended advantage of Protection can be shown to be null; the producers of a country reap no benefit from Protection, but the reverse. The proof of this can be clearly given; at the same time it has this inconvenience, that it can only in part be illustrated; the argument is therefore one that has more clearness than practical compulsion. On the other hand, the injury done to consumers by Protection, if somewhat less clear argumentatively (as overbalancing, we mean, the supposed advantages to producers), has this advantage, that it can be illustrated practically. The injured consumers are in many cases to the fore, and can be seen and give evidence *in propriâ personâ*. The American farmer, for instance, can and does loudly complain of the expense to which he is put in constructing his farmbuildings, through the restriction laid upon him against getting his materials where they are cheapest. And so far as the consumer is a producer as well, such an example supplies the deficiency indicated in the former line of argument.

But, however skilfully such arguments as these may be urged, we must end as we began, by saying that the times are bad for Free-traders, and for the reason we have assigned; that drowning men catch at straws, and there are many drowning men in the world of commerce just now. There is a blind stretching out after security which will not listen to reason. And there are many loopholes in which fallacy can work, even after truth has nominally been admitted. It is very characteristic of the powerful crude common sense of a man like Prince Bismarck, who is apt to act energetically upon half insight, that he should think that the evil effects of Protection can be annulled by protecting all trades alike, as if the unfairness of it could easily be remedied by an artificial proportioning of duties, or as if there were no other evil in Protection but this. Prince Bismarck expects that, in consequence of a tariff system "favouring the united national production," "the total amount of wealth created at home" will "be increased, and thereby the wellbeing of the people in general be raised." Whether the united national production is likely to be favoured by shutting out the greater part of those materials which can be obtained from foreign countries is a point which we hope will not in the end be beyond the common sense of Germany. In fine, those who trust to solid reason are seldom deceived in the end; and on this ground of confidence Free-traders may very well rely.

SOUND COMMON SENSE.

THERE are many forms of priggishness, and there are many false applications of terms that are sufficiently odious, but one of the most objectionable is the reckless misuse of "sound common sense." So often is this excellent trait of character assigned to those in whom it is conspicuous by its absence, and so frequently are high-handed proceedings taken in its name, that, if we were to endeavour to picture to ourselves the personification of sound common sense, we should imagine an obstinate bully, if not an obstinate fool. Certain persons are said to possess common sense whose claim to this distinction can only be maintained by paraphrasing "common sense" as "vulgar feeling"—a quality with which they are richly endowed. A famous novelist once said that an Englishman would rather have his morality impugned than his horsemanship; and we believe it might have been safely added—and his piety rather than his common sense. The latter quality represents the average Briton's mental rendering of the word "virtue," and it is a safe assertion that common sense is estimated more highly than valour in this latter half of the nineteenth century. The popular religion appears to be, "There is but one God, his name is Common Sense, and the *Times* is his prophet. There is also a demon, who goeth about seeking whom he may devour, and his name is Humbug."

It would be hard to define common sense in its best meaning, but it is not so difficult to discover its popular acceptation. Roughly speaking, of course, most people's idea of the common-sense view of any matter is their own view; but this definition is but a poor one to offer to the would-be Solons. Here is a more practical one—Try to find out the opinion which will grate least on the feelings of the greater number. It is certain that you cannot please everybody, and it is equally certain that, if you entirely please some, you will entirely displease others; but if you displease all as little as you possibly can, although you may not acquire a reputation for great talent, you will probably be credited with common sense, and you may likely enough, in course of time, attain the high honour of becoming an arbiter and referee. In fact, you will probably prove a useful machine for the striking of mean averages. The man is universally honoured who is so unenthusiastic, so unimpressionable, so unimpassioned, that he may safely be trusted, by all sides and parties, to deliver on any given subject one of those inconsistent and compromised opinions known as impartial judgments. Such a one enjoys much respect, and an excellent digestion during life, and he is certain of an honourable name after death. Blessed are the moderate! Blessed are the thick-headed! Many people fall into the mistake of confusing first impressions with common sense, fancying that when a question is laid before them a rapid exercise of the mental faculties is most to be trusted. They imagine that in a more mature consideration of the various bearings of a case the mind is apt to dwell from predilection on certain points to the neglect of others; but they forget that in a cursory view essential features are often missed, or, if observed, are in a great measure misunderstood. When the most general opinion is taken as the definition of common sense, we too often find the anomaly of popular prejudice disporting itself in the prophet's mantle. It is amazing to observe how extremely sensible and wise people are often considered who are saturated with vulgar prejudices and invincible ignorance. Perhaps when pigheadedness is combined with an utter absence of enthusiasm, the very acme of the popular notion of prudent judgment has been attained. The man who has the reputation of sound common sense, whatever may be his nominal politics, is generally a reveller in the conservatism of the present, while he equally shirks the toryism of the past and the radicalism of the future. He is prone to apply the same unvarying rules and tests to all cases and to all persons, overstraining the proverb that "what is sauce for the goose is sauce for the gander," to the neglect of the adage "that what is one man's meat is another man's poison"; and this in some measure probably proceeds from a want of appreciation of the strength and weaknesses of others, of human enthusiasm, and of human foibles. Convinced of the infallibility of his own opinion, he rapidly seizes and draws his conclusions from the more apparent, to the neglect of the less apparent, but often most important, bearings of the matter in hand. A very usual interpretation of the term under notice is a good lay opinion, untrammelled by the technicalities and precedents of experts and professionals; and although in certain instances, such as small magisterial courts, for example, unprofessional administration is on the whole wonderfully successful, the more usual result is signal failure. Principles are excellent things, if they are good; but principles alone, without experience and professional knowledge, will not always enable a man to give a just opinion in certain cases. These paragons of sound common sense, however, seem to think that their principles, unassisted, will

carry them through all difficulties. So thoroughly *ad nauseam* do they parade their principles, that we are sometimes tempted to wish we could confront them with the bore mentioned by Byron in a letter to Moore. "And why, sir," said he, "did the P——e cut *you*?" "Because," was the reply (interlarded with a heavy oath of the period), "I stuck to my principles." "And *why* did you stick to your principles?"

Far be it from us to deny that the exercise of ordinary but well-balanced faculties is most useful in its proper province. It often acts as a valuable drag upon fanaticism and monomania; it serves as a counterpoise to professional cliquism, and helps to restore the equilibrium so often overbalanced in highly cultivated minds. Used judiciously, common sense is a valuable intellectual sedative, but in excess it becomes an overpowering soporific. In the thousand and one little questions which occur so frequently in rural matters and county business it is beyond price; and, whatever may be its deficiencies, it is vastly preferable to a "little knowledge." Its value depends to a great extent upon its owner's knowledge of its exact worth, and his delicate appreciation of the point at which its province ceases. Nor must we omit to insist upon the importance of its accurate recognition in others. Comparatively few people seem to have the power of distinguishing the true metal from its alloy, and many, in consequence, obtain the credit of its possession who are utterly devoid of it. This cheap reputation once acquired is as easily retained as a bad name by a dog, and with the mischievous result that the opinions of the pseudo-oracle on all kinds of subjects are adopted by his admirers with a simple faith which might be envied by a *religieuse*. On the other hand, it is easy to fall into the opposite danger of unjustly imputing a want of common sense to others. It is a plausible, if not a clinching, argument to condemn your adversary as utterly destitute of common sense; but, at the same time, a bold assertion that such or such is the common-sense view of a matter is apt to excite a prejudice against it. If a man simply says that such is his private opinion, we may respect it, and be disposed to give it every fair consideration; but when he adds that his opinion is based on sound common sense, he virtually implies, "because when I define faith and morals, I am infallible." We have no doubt that the Eastern ecclesiastic who said that those who sang Alleluia twice sang to their own damnation considered his view of the question to be sensible and moderate, and it is possible that the stoning of the first Christian martyr would have been considered as dictated by sound common sense, by many gentlemen now enjoying the highest reputation for the gift of this virtue, had they lived in apostolic times.

Common sense may also be considered in its more comprehensive acceptation, as meaning the general consensus of opinion of the most sensible men. Here again its fallibility is at once apparent. The Solons of one age disagree with those of another. Public opinion changes, and has to be gradually educated. Therefore the common sense of one year may be the folly of another, and the fool of this decade may become the wise man of the next. But what a consolation it would be if the prig who claims sound common sense could be made to eat his folly at once and in our presence, without waiting for time and events to prove his errors. Few things are more irritating than to hear him holding forth upon subjects which he does not understand, uttering truisms which are inapplicable, and using arguments which may not be immediately controvertible, but against which human reason tacitly and instinctively rebels. How devoutly do his hearers wish that he would reserve his common sense for home use, instead of "bringing it to bear," as he calls it, in season and out of season. Have we not many instances of this in a certain legislative assembly where old Indian officials, chairmen of quarter sessions, City magnates, and directors of Companies, all of whom may enjoy reputations for excellent common sense, omit to exercise it by holding their tongues during debates upon questions concerning which they are essentially and profoundly ignorant? So accustomed have they been, in their own little spheres, to have their opinions consulted on all occasions, that they fondly imagine that their dicta will always be welcomed, and every assembly, whether Parliamentary or other, represents to them a body of men anxiously awaiting their dictatorial advice. In short, much as we dislike the artistic, the religious, and the political prig, we have almost a greater horror of the incarnation of what is called sound common sense. He is a bore of the first water, and although a useful machine for certain purposes, he should be carefully kept out of sight, unless specially wanted for some piece of perfectly commonplace work.

GOLD AND SILVER.

According to a telegram from the Philadelphia Correspondent of the *Times*, the production of gold and silver in the Pacific States and Territories of the United States last year showed a falling-off, compared with the previous year, of a little over two and a quarter millions sterling The yield of gold was 7,791,246*l.*; that of silver, 7,749,278*l.*; together, 15,540,524*l.* It does not clearly appear whether the figures relating to silver represent the net value of the metal extracted, or only the total out-turn of ore from the so-called silver mines. The distinction is material. All the American silver mines contain a large proportion of both gold and lead. In the Comstock Lode, for example, the proportion of gold is estimated as high as 45 per cent., and for the whole Pacific seaboard it is said to be 37 per cent. The proportion of lead is about 5 per cent. If, then, the above figures give only the gross production of the silver mines, the net yield of silver would be about 4,650,000*l.*, which would not quite suffice for the minimum coinage required in the twelve months by the Bland Act. It is probable that the necessary allowance for the presence of other metals in the ore has been made, and that the figures above given relate to the net yield of silver. Even so, however, they prove that the present depreciation of silver is greatly exaggerated, and that as soon as the German Government has disposed of its surplus stock of the metal, the price may be expected to rise. The Committee presided over by Mr. Goschen estimated the production of the American mines at a minimum of nine millions sterling per annum. The agent of Messrs. Rothschild put the estimate as high as ten millions, and the American officials favoured a still higher figure. According to all these authorities, the world was about to be flooded by immense quantities of the metal at the very time when Germany and the Scandinavian countries were abolishing its use as money, and the increase of the India Council bills was diminishing the demand for the East. Nor was this the most serious feature of the case. The cost of mining was said to be so small that one famous Company divided among its shareholders as net profit more than two-thirds of the whole value of the ore raised. If this was really true, and was not accidental, it is evident that production might go on at the same rate, even if the price fell one-half; and the shareholders would still have over one-sixth of the gross yield for their share. That is to say, the cost of bringing the metal to market, even if the depreciation were to go from its present stage 20 per cent. to 50 per cent., would still not quite reach 83 per cent. Thus there seemed to be no end to the possible depreciation. It is now manifest that the statements relative to those mines laid before the Committee were either greatly exaggerated or were entirely exceptional. The out-turn has never reached the Committee's estimate, and last year it fell short of it by 1¼ millions sterling. Either, therefore, the ore was never as abundant as was supposed, and the mines are already giving signs of exhaustion; or the cost of working was so much greater than was represented that the existing depreciation has checked the production. In either case the decline in value is excessive. It is to be borne in mind that the mines of Mexico and Peru have long been showing signs of exhaustion, and that the fall of price has probably already made the working of some of them unprofitable. Sooner or later, therefore, an upward movement seems inevitable, if the Latin Union, Austria-Hungary, and Holland preserve their expectant attitude. But Germany must get rid of her surplus stock of the metal, and some change must be made in the present system of India Council drawings before the prevailing panic can be entirely allayed.

While the falling-off in the production of silver is an unmixed good to all but the mine-owners, promising to put an end to one of the principal causes of disturbance in the Eastern trade, the decrease in the yield of gold is of a different character. In the three years ending with 1855 the average out-turn of gold from all the mines of the world was, according to the best authorities, about 28 millions sterling per annum; ten years later the average had fallen to about 21 millions; and ten years later still it was as low as 19 millions. In twenty years, that is, the decrease of the annual production was about nine millions sterling. Owing to the discovery of the silver mines in Nevada and California, there was for a brief space an increase of the yield of gold in America, which has, however, again ceased, without a compensating augmentation elsewhere. The present position is thus a falling-off, to the extent of almost one-third, in the world's yield of gold since the time of the Crimean War. But in the interval there has been a very great increase in the consumption of gold. The Western States of the American Union, Australia, New Zealand, and South Africa, have been opened up and settled, Japan has been brought into communication with the rest of the world, the isolation of China has been further broken down, the suppression of the Indian Mutiny has been followed by a policy of material development, the civilized part of the globe has been equipped with railways and telegraphs, navigation has been revolutionized by the application of steam and the employment of iron in shipbuilding, and the Suez Canal has brought the East into close proximity to Europe. In consequence of all this there has been an unprecedented development of industry, expansion of trade, and accumulation of wealth, requiring a vast increase in the gold circulation. Within the past ten years, for instance, it has been calculated by an eminent statistician that the principal banks of Europe increased their stock of gold by 83 millions sterling, or, on an average, more than eight millions annually. The active circulation has also been largely augmented, notwithstanding constant improvements in the organization of credit. The metallic currency of France, for example, is now mainly composed of gold. Thus there has been an extraordinary increase of consumption in the old gold-using countries. And, further, gold has been adopted as the sole standard, instead of silver, by more than one great nation. The import of gold into Germany since the close of the war is estimated at nearly 60 millions sterling, or almost 7½ millions per annum. In preparation for resumption during the past three years the United States Treasury has accumulated almost 24 millions sterling in gold, or 8 millions per annum, to which ought to be added the accumulations of the banks. And there still remains to be taken into account the gold used by the Scandinavian kingdoms in following the example of Germany. Without reckoning these, however, we have found during the past ten years an extraordinary demand by the

principal European banks, by Germany, and by the United States; amounting to 167 millions sterling, or, on an average, 16⅔ millions per annum, the whole yearly production being, if we take the mean between that of 1865 and that of 1875, only 20 millions. The surplus available for making good the inevitable wear and tear in the old gold-using countries, for providing the banks of the United States, and the treasuries of Sweden, Denmark, and Norway, and for supplying the arts, has thus been only 3⅓ millions a year. As this surplus is palpably insufficient, the new demand must have been partly satisfied by withdrawals from previously-existing stores in the gold-using countries. The conclusion to which we are thus led is that we need be in no haste to see the universal adoption of the single gold standard. During the past ten years the world's production of the metal has been inadequate to satisfy the demand; and if the demand is still further increased, while the production is decreasing, the struggle between the old gold-using countries and the new will be prolonged and embittered. As the stock of the metal held by the former diminishes, the need for protecting what remains will grow more and more urgent. The great banks will adopt the usual course—that is, raise the rate of discount—and, in the general conflict that will ensue, industry, trade, and credit must necessarily suffer.

It is a very nice question, and one exceedingly difficult of solution, whether the gold scarcity which we have been tracing has yet made itself felt in trade. A scarcity of the metal which forms the standard of value means, of course, that it is dear, that a smaller quantity of it than before will buy the same quantity of other things; in other words, that there is a fall in the prices of commodities generally. As everybody knows, there has been a continuous and very heavy fall of prices during the past five years. But then those years have been years of protracted depression in trade. Owing to causes which we have often investigated in these columns, there was in 1873 a sudden and great diminution of the purchasing power of nearly all countries; and it was inevitable that producers, finding their wares unsaleable on their hands, should try to stimulate consumption by reducing prices, and should repeat the process again and again. A portion of the fall, at any rate, is thus quite independent of the decrease in the production of gold. But it is the opinion of many thoughtful observers that the depression in trade does not account for the whole of the facts; in other words, that the fall of prices has been increased by the scarcity of gold; that, consequently, unless the production of the metal is augmented, the recovery in prices expected from a revival of trade will not reach the level of ten, much less of twenty, years ago; and that, in short, wages and prices will in future be permanently lower than they have been since the great gold discoveries in California and Australia. In support of this opinion they cite the fact that the prices of the principal commodities are now lower than they were during the periods of depression that followed the panics of 1857 and 1866, though not quite so low as after the great railway mania of 1847. The argument is deserving of attention; but it is palpably inconclusive. It assumes that the present depression is not more intense than that experienced on the two last occasions, which it is obviously impossible to prove. On the face of it there is a marked difference between the state of trade now and its state after 1857 and 1866. On both those occasions the crisis began with a panic, and was consequently sharp and comparatively short. The present depression, on the contrary, was at first little more than a slackening of extraordinary prosperity; it has been protracted beyond precedent, and only of late has reached the acute stage. Like an obstinate disease in which the constitution refuses to throw off the humours from which it is suffering, the unsound business that was weighing upon the trade of the country has maintained itself in spite of falling markets. This circumstance alone renders of little value the comparison to which we have referred. Another point which must be taken into consideration is the great multiplication of banking facilities. To what extent has the note circulation of Europe been increased during the past ten years? Through the trials of the German war and the Commune the notes of the Bank of France, though inconvertible, remained at par, or nearly so—a convincing proof of the education of the French people in the credit system. To what extent have the notes permanently supplanted coin? And the same question may be asked of other European countries. Here at home the use of cheques is every day becoming more and more general; so much so, indeed, that, in London at least, people never keep by them more than a very few sovereigns or notes. A mere decrease, then, in the production of gold proves nothing as to the future range of prices, unless it can be shown that there has not been a proportionate increase of credit facilities, and also that the fall of prices is greater than the depression of trade will account for. Yet we are not prepared to deny that the scarcity of gold is deepening the depression of prices. In our opinion, there is not as yet a sufficient basis of ascertained fact to warrant a definite conclusion either way. It is quite clear, however, that, should the scarcity continue and the demand for gold increase, there must be a permanently lower range of prices.

SOUP KITCHENS.

It would be difficult to explain how the soup-kitchen first became introduced and naturalized in this country as the popular institution for distributing charitable doles of food to the poor, since soup is not a customary or favourite dish, or indeed a barely tolerated one, in the homes of the English labourer and artisan. It may have reached us from across the border, where broth is a national institution, or from across the Channel, where soup is considered a necessary part of daily sustenance by all classes of society. Or, what is more probable, it may have originated *de novo* from the simplicity of the form of cookery, and its fitness to meet the temporary and urgent demands for food which our rapidly changing climate and the varying sources of distress necessitate. Whatever may have been its origin, the soup-kitchen as a mere soup-producing institution is ill adapted to meet the exigencies of the present state of distress in this country. With our increased knowledge of the physiological use of different kinds of food, and the increased skill in their cheap and simple preparation which the School of Cookery should have taught by this time, the soup-kitchen should be superseded by the public kitchen; or, if it is more convenient to retain the old name, it should extend its operations over a much wider field of cookery, if it is to contend successfully with the famishing crowds which now beset its doors. Soup contains very little nourishment in the ordinary meaning of the word; it is made from coarse meats, the nutritious parts of which are imperfectly soluble in boiling water; and the constituents which are extracted, such as the gelatin and the salts, afford little support to the body of healthy persons. Soup is, moreover, quickly digested, and, as people know who are accustomed to follow their course of soup at dinner with two or three courses of more substantial food, it is ill adapted to satisfy the cravings of an empty stomach. To meet effectually the needs of people in the districts where the distress prevails, who lack work but retain their healthy appetites, we ought to consider before all things how we can best allay the pangs of hunger and keep the body warm and healthy. The maintenance of the muscular strength and the gratification of the palate are considerations beyond the scope of charity, and lie outside its chief purpose, which is to relieve pain and suffering and preserve life.

Whatever may be the physiological explanation of hunger—and doctors differ about this, as they differ about so many other subjects—it is evident to all of us who have felt its urgent calls at one time or another that the articles of diet which possess considerable bulk are best fitted to satisfy it. "A full belly loathes the honeycomb" should be the motto of all soup-kitchens which undertake to deal with healthy appetites; and fortunately the kinds of food which most effectually and speedily remove the cravings of hunger are equally suitable for keeping up the temperature and the health of the body, and are moreover the cheapest, and demand little skill in cooking. The combination of starch, sugar, and fat, as exemplified by the common suet-pudding, containing a few raisins and sweetened with treacle, or rice or Yorkshire puddings, common and favourite dishes with the labouring classes, are types of this kind of food which the managers of soup-kitchens should keep before their eyes. The preparations of peas, haricot beans, oatmeal, whole wheat in the shape of the North-country dish of fermenty, are valuable forms of food which contribute largely to the strength as well as to fill the empty stomach. It is "stodging things" of this sort—if we may be excused using a schoolboy's expressive phrase—which the famishing labourers and mill-hands require, and not basons of soup consisting of much hot water, flavoured with a little meat, vegetables, and salt, which serve rather to whet the appetite than to dull its edge.

For the proper preservation of health vegetables are required in much larger quantities than they are to be found in soups. From a Report of the Local Government Board on the Health, &c., of Factory Children, published in 1873—a year of great prosperity in the manufacturing districts—we learn that a very large number of the children were suffering from a state of health bordering on scurvy, as was evinced by the existence of a spongy state of the gums and other indications of a disposition to that disease. Potatoes, carrots, cabbages, and other green vegetables should form a constant and liberal portion of the diet distributed by soup-kitchens, and to ensure their consumption they should as far as possible be incorporated with other kinds of food in stews, &c., that they may not be refused or thrown away by the recipients, who are generally lamentably ignorant of the value and necessity of the use of vegetables as articles of everyday consumption. The dried apples which come to us in casks from America are cheap and agreeable anti-scorbutics, and could be combined with the starchy foods, with the additional advantage of making them more palatable, especially for children. Of the more highly nitrogenous articles of food, fresh or tinned milk for children, and cheese for adults, are the cheapest and most suitable for charitable purposes. Herrings, which are cheap and savoury, are the most nutritious of fishes, and pork, though not the most digestible, is one of the most satisfying, heat-giving, and savoury of meats. Both herrings and pork have the further recommendation of being favourite dishes with the labouring classes. It is very doubtful, we think, from both a social and pecuniary point of view, whether the managers of soup-kitchens and similar temporary charities would be justified in spending their funds on beef, mutton, and other expensive luxuries for persons suffering from distress due to want of employment. The pauperization of the lower classes is a very easy process at times like the present. The benevolent are easily imposed on by undeserving persons, and many men and women learn—perhaps for the first time in their lives—to be content to live on charity. Probably the cheapest and most healthy dietary which could be adopted by any organization for the relief of distress is the one which exists in the borough or county prison situated nearest to the suffering district. Mr. Chadwick's glowing

account, at the meeting of the Sanitary Institute at Stafford, of the remarkable sanitary state of prisoners, and the experience of magistrates and others who have taken part in the management of prisons, will bear out this assertion.

For the young children who, alas! must form a very large portion of the sufferers, more kindness and consideration will be needed than for their parents. For them good soup, tea, milk, and sugar, with plenty of bread and treacle, dripping or bacon-fat, rice and apples, &c., are necessary, and should be freely distributed, as it must be borne in mind that they have their growth to support as well as their hunger to appease. Tea is the best of all drinks for half-starving people. Not only does it cheer the drooping spirits without exhausting the nervous energy, but it restrains the general waste of the tissues of the body—a matter of much importance when the food is deficient either in quantity or quality. The few general hints we have thrown out will, we trust, be useful alike to the managers of soup-kitchens, and to private persons who prefer to dispense to deserving persons their own charitable gifts rather than throw them into a common fund. Those persons also who are struggling to make both ends meet without appealing to public charity may find comfort in the knowledge that many of the expensive luxuries which they have been accustomed to consider necessaries of life are not absolutely indispensable to keep the body in good health until better times return. Our remarks do not of course apply to the sick, who are the proper subjects for hospitals and workhouses and the medical care which those institutions provide.

REVIEWS.

LIFE AND LETTERS OF DEAN HOOK.*

IT is scarcely necessary to recall the well-known outward facts of Dean Hook's career. No man's life was ever more open to the world, or at least to that part of the world to which the fate of the Church of England is a matter of daily concern. Indeed he was continually thrusting himself upon its notice, and telling men exactly where he stood, although not for his own but for his Church's sake. If he had fulfilled that early dream-sketch of future pastoral life which he sent to his brother in 1813, when he did "not want to be more learned," and intended to have an artificial "Parnassus" in his parsonage garden, and to recommend all his poor parishioners to study Milton; or if he had remained for life at his beloved Whippingham—Whippingham remaining what it then was—or at Moseley (Birmingham), or even at Holy Trinity, in Coventry, the world would probably have known little about him. A pastor often owes at least as much to his flock as his flock owes to him. Leeds made Dr. Hook. It brought him into the fullest possible contact with those forces, both attractive and repulsive, which alone could develop all that lay in him as a born pastor. Hence the central point of interest in his biography begins and ends with his amazing and successful activity as Vicar of Leeds; it was in this post that he was able to attain the repute of being, in Mr. Gladstone's words, "the foremost parish priest of the age." That he was not only the man for that people, but that they were the very people for such a man, is a truth which comes out in every detail of his biographer's excellent chapters on his election and parochial work at Leeds—a subject which occupies seven out of the twelve chapters into which Mr. Stephens has arranged his book. The story of his boyhood and youth, which is supplemented by Lord Hatherley's interesting contribution, contains a great deal which will be new to most readers, and surprising to not a few. We may point, for instance, to his fervid idolatry of Shakspeare and Milton, his comparative indifference toward classical study at Winchester and Oxford, his strange zeal for the renovation of the English stage, his despairing conviction that distinction in life was rendered for ever impossible through his failure to win the Newdigate prize for English verse, and the apparent indecision and defect of fixity of aim which led him to desire his father and mother to decide for him what vocation he should follow—although, indeed, he chose at last for himself. "It is not my least ambition," he wrote from Oxford to his mother in 1819, only two years before his ordination, "to be able some day to acquire money enough to become a manager of some great theatre, as Sheridan was." It is characteristic, however, of the innate force of self-reliance which all along lay beneath the desultory and uncentred mental movement of his younger days, that he conceived "it would be a national benefit" if he ever became a theatrical manager.

In addition to his unparalleled success as a parish priest, in which province he was no man's imitator, and may almost be ranked amongst inventors and discoverers, Dean Hook has a second title to remembrance, as the foremost practical expounder of the Anglican *Via Media*. Although he was born and educated in the densest atmosphere of political party, and for the greater part of his active life was chiefly regarded by the world outside his parish as an extreme ecclesiastical partisan, he was always incapable at heart of being a party man. As the grandson of Sir Walter Farquhar, physician to the Prince Regent, and as the nephew of Theodore Hook, he inherited that peculiar form of Toryism which could or would see nothing but grace, intellect, and sublime moral dignity in King George IV. The personal kindness of the King to Hook's pluralist father, who died Dean of Worcester, as well as to his grandfather, caused him to regard that monarch, as he afterwards said, "with something like family affection." At Winchester and at Oxford, Hook's Toryism was not merely extravagant, but even ferocious, and was usually manifested in strong assertions of the immaculate character of "our good King." It was strange that his life-long friend should be a son of Alderman Wood, and consequently an inheritor of that equally remarkable form of Radicalism which used chivalrously to write the name of Queen Caroline upon its flag. All direct personal intercourse between these two young men was rigorously stopped by Hook's father in 1820, just as Mr. Wood had arrived in England after an absence of two years at Geneva, and when the friends were counting eagerly upon their reunion. The old clergyman forbade his son to meet the son of a man who was so prominent an advocate of the Queen's cause. Hook obeyed the letter of the command, just as throughout life he obeyed law coming from lawful authority, but he resisted it in spirit; and, writing to his mother from Oxford, he declared that he felt bound to sacrifice the claims of party to the claims of friendship. "I love my friend," he wrote, "ten thousand times better than I love my King." Rather than "desert him who has ever been faithful to me," he said, "I freely confess I would much, much sooner see the King hurled headlong from his throne—which God forbid."

This was an early indication of his readiness to sacrifice party to something which he counted far more precious. Later in life he manifested the same mental attitude in matters of larger concern. There was a moral *Via Media* in the man himself anterior to that intellectual *Via Media* in which he found rest and power, and on which he took so firm a stand in ecclesiastical doctrine and ritual. The intellectual middle way may be assumed by the merest "Neuter," "Trimmer," or "Mr. Facing-both-ways"; but the moral middle way lay at the root of Hook's masculine steadfastness throughout the dire succession of ecclesiastical frights which agitated the English clergy during his tenure of the vicarage of Leeds. The natural tendency of his "old Adam" was towards extremes, for he was a man of impulse, frolic, and humour, all of which, unless kept in check, urge a man into unsteadiness of thought and action. In his attitude towards the Ten Hours Bill, and the burning question of popular education, he showed how completely he worked himself free from the chains of party whenever a higher obligation, as he supposed, was demanding his allegiance. In his speech at a great meeting at Leeds in favour of the Ten Hours Bill, in March 1844, the Vicar said:—

> If I thought you working-men were in error on this subject, I should still sympathize with you, though I should not be here to-night. But believing and knowing you to be in the right, I should be unworthy of the post which I occupy in this parish were I to permit any reluctance on my part to oppose her Majesty's Government to prevent my being present. Yes, I will go further, and say that I come here to tell you that I am ready in this righteous cause to press forward with you to the last gasp; and that if a collision should occur between your interests and the interests of a higher social class, you may depend upon finding me upon your side. And I trust that our friends in London, when the question is put to them, whether they will support the cause of the poor or the cause of party, will fling party to the dogs, and support humanity.

When his impulsive tendency, however, carried him thus far, and he was interrupted by the vociferous cheering of his audience, he was too steadfast and fair a thinker to forsake his *Via Media* standpoint; he did not allow himself to be swung from one party to the other, but went on to observe that much was to be said on the manufacturers' side. In his celebrated pamphlet on Education, which produced a greater stir than anything else from his pen, his Letter to the Bishop of St. David's, entitled *How to render more efficient the Education of the People*, he made a similar stand. He drew down upon himself by his remarkably daring propositions—for such they were at such a time—a storm of reproaches from Churchmen and Dissenters alike. The moral pith of the pamphlet, which was really an extension of the *Via Media* principle to a new province, lay in his appeal to all "Englishmen" to "cast aside party feeling, and unite as one man to repel the enemy."

> In our warfare against ignorance and immorality, casting aside all minor considerations, not involving principle, may we be united in one common cause, doing not what, abstractedly considered, we should deem to be the best, but the best in those circumstances under which the Providence of our God has placed us.

It is significant that Dr. Hook wrote this pamphlet, in which he stood upon the *Via Media* betwixt Churchmen and Dissenters, while he was in the heat of the most bitter conflict of his pastoral life, that which was brought upon him by the early experiment of the second school of Tractarians at St. Saviour's Church in Leeds, from which priest after priest emigrated to the Roman communion. "The Vicar was worried," as Mr. Stephens puts it, "by the vituperation of extreme Protestants on the one hand, and by the remonstrances of extreme Puseyites on the other." That which was most provoking to his strong and steady character was naturally the feeble "onesidedness," as he often said, of the Romeward movement. The theorists were safe in their retreat behind Oxford walls; they were secured from the need of the struggle for daily bread; they knew English Dissent only as a name in newspapers; they came into no actual contact with the powerful forces opposed to the English Church. Before they had worked out the theory of the Anglican *Via Media* upon paper, or pieced it together from a comparative study of

* *The Life and Letters of Walter Farquhar Hook, D.D., F.R.S.* By his Son-in-law, W. R. W. Stephens, Prebendary of Chichester, and Rector of Woolbeding. 2 vols. London: Richard Bentley & Son. 1878.

Andrewes, Hooker, and the Caroline divines, Dr. Hook was exhibiting in Leeds "a parish well worked on the Church of England system." "My desire was," as he wrote in 1847 to Mr. Wood, "to show that the *Via Media* could be carried out." He was elected Vicar of Leeds in 1837, and in that same year Dr. Newman wrote, in his *Lectures on Romanism and Popular Protestantism*, "There certainly is a call upon us to exhibit our principles in action, and until we can produce a diocese, or place of education, or populous town, or colonial department, or the like, administered on our distinctive principles, doubtless we have not so much to urge on our behalf as we might have." It was no doubt unfortunate alike for Dr. Hook's own principles and for St. Saviour's that he allowed himself to be thus worried. Those outside of Leeds who were working that early experiment of a mission Church, with numerous services and a hard-living clergy, were as much disappointed as he could have been at the Romeward tendencies of their nominees. Their mistake lay in their choice of instruments, and a fuller recognition by the Vicar of Leeds that the "worry" was not all on one side might have led to some pacific arrangement. This seemed at one time possible while a really large-minded and able man, A. P. Forbes, held the vicarage of St. Saviour's. But after a few months' incumbency he was called away to the Bishopric of Brechin, and things fell back into their old unlucky groove.

Plentiful materials are supplied by Mr. Stephens for the exact orientation of the relation of Dr. Hook to the original Tractarians, and also to "the young clergy of the new school," whom he described in 1842 as tyrants toward congregations and rebels towards bishops. At the beginning of 1850, when taunted with desertion from the ranks of the High Church party, he declared:—

> I am not conscious of having changed a single principle for the last thirty years. I have not left any old party, and certainly I have not united myself to any new party. I am where I was found by many of those who are now severe in their censures of me, and where I intend by God's grace to remain.

He found the reasons for his position in the excesses of word and deed of the Romanizers of that period:—

> When they changed their Ultra-Protestant principles, and accepted the English Reformation, defending it, as they did, in the earlier volumes of the *Tracts for the Times*; when they walked in the middle way, and in escaping from Ultra-Protestantism protested against the errors of Romanism, I rejoiced in their alliance, and did not shrink from my share of the obloquy they incurred. But when I now find them calumniators of the Church of England, and vindicators of the Church of Rome, palliating the vices of the Romish system, and magnifying the deficiencies of the Church of England, sneering at everything Anglican, and admiring everything Romish—when they who were in the pit on the one side of the wall have now tumbled over on the other side, and have fallen into a lower deep still gaping to devour them, I conceive that I am bound as a High Churchman to remain stationary, and not to follow them in their downfalling.

He constantly referred to Bishop Jebb, whom he calls "My dear Gamaliel," as his original leader into the *Via Media*. His confidence in the inherent *vis medicatrix naturæ* in the English Church was so firm as to make him opposed to all attempts to crush the "Tractarian Rump," as he called the extreme Ritualists in later years, by the sledge-hammer of repressive legislation. He termed them, besides other uncomplimentary epithets, "an insignificant set." Yet he had, like other thinking men, grown with his times. Of this growth in his last years he gave a remarkable proof which Mr. Stephens has forgotten to notice. When the declaration of the clergy provoked by the Purchas Judgment was ready for presentation, the Archbishops and Bishops, and other leading signers found reasons for declining to take the prominent position of presenters. Dr. Hook fearlessly undertook the task. This act on the Dean of Chichester's part was the more courageous as his lifelong friend Lord Hatherley was one of the authors of the impugned judgment. It is a significant fact that Hook finally made his way, before leaving Leeds, to a political as well as an ecclesiastical *Via Media*. He discovered by his practical intercourse with men that a nation and a National Church, as such, are of no party.

> In the Church [he wrote to Lord Hatherley in 1849], among the clergy as well as the laity, there is the large portion leaning now to one side then to the other. It is so in politics. The bulk of the people are neither Whigs nor Tories, but sometimes of one party and sometimes of the other, as either party seems best qualified to meet existing difficulties. I am one of these. The noise is made by strong partisans; but the strength of a partisan lies in his ability to persuade those who are (though not professedly, yet in fact) of no party.

Hence Hook's *Via Media*, both in Church and State—although in the former province he thought it half inherited and half taught him by Bishop Jebb—was the product of his own personal character, and it was incapable in him of being turned into an excuse for sluggishness in action or stagnation in thought. The happiest estimate of the combined fixity and mobility of the man was struck out by that keen observer Bishop Wilberforce, who once observed:—"Hook is like a ship at anchor, which, without moving from its anchorage, always swings round to turn its breast to the tide."

Throughout Dr. Hook's ceaseless activity as an author he preserved the same masculine and mediatory temper which characterized him as an ecclesiastic. During the busiest period of his pastoral life he never made business an excuse for the neglect of study. In winter as well as summer he was in the midst of his books at those early hours of the day in which many a hard-working pastor is in bed. We believe that he wrote the greater part of his controversial pamphlets, and even his popular lexicons, the Church Dictionary and the Ecclesiastical Biography, between five and nine in the morning. The growth in grasp and in freedom which is evident in his later writings was due not merely to his unremitting energy in historical reading, and to the inherent fairness and courage which made him as ready to unlearn as to learn, but also to that clearer and sharper appreciation of his own position, as the champion of the Anglican *Via Media*, which he derived from the study of the national Church history as a whole. Apart from the Anglican theory, the history of the Church of England or of English Christianity can scarcely be said to possess historical unity. The Romish historian must place all good in the *Ecclesia Anglicana* on the further side of the break with Rome, while the Puritan historian must place all good on this side of it; the Anglican alone is sufficiently free to see the good and evil on both sides of it. The *Lives of the Archbishops of Canterbury*, the greatest and most enduring of Hook's literary works, the result of his lifelong studies, was happily not begun until he had the leisure to devote himself entirely to its elaboration, and when his mind had become singularly ripe for the treatment of such a subject by his manifold experience of men and things ecclesiastical. His history, for such it is, owes much of its charm and power to the fact that it is the work of a man who had spent life in helping to make the ecclesiastical history of the present before he sat down to write the ecclesiastical history of the past. When we look for the centre from which Dean Hook worked as the historian of the Archbishops, we find that he had two strong prepossessions—the bias of a thorough Englishman and the bias of an Anglican ecclesiastic. The two are not always found in the same man; in Hook the one acted as the corrective of the other. In reading the earlier volumes, we feel that the writer is no mere bookworm or bibliographer; an Archbishop Theodore or Archbishop Boniface was realized by him as a living person, the Archbishop Howley or Archbishop Tait of an earlier time. The most difficult and delicate of all the archiepiscopal portraits, those of Cranmer and Laud, were painted by Dr. Hook with a fairness and truth which no previous historian, ecclesiastical or secular, had attained. Those who admire Cranmer are almost certain to hate Laud; while those who are ready to condone Laud's faults are not likely to have much mercy for Cranmer. It takes a strong man, who has planted both feet upon a very firm *Via Media*, to be at once fair towards both and severe towards both.

It is not too much to say that Mr. Stephens has added a permanent contribution to English ecclesiastical biography. This is due, no doubt, in the first place to the prominence of his subject; but Hook's important position in the evolution of the practical side of a great movement in English Church history makes rather for the hiding than for the revealing of the singular merits of his biographer. His work is by no means free from literary flaws, and we can conceive that it might have turned out a heavy and dull performance but for the assistance which he has received from Dean Hook's life-long friend, Lord Hatherley, not only through the long and interesting chapter of early reminiscences contributed by the latter, but still more through the rich mass of autobiographical memorials which he has supplied in the shape of Hook's letters to himself. In one of those Hook calls the friend of his boyhood his "father-confessor"; and it is evident that no secret of his inmost heart and no trouble of his active outward life was ever withheld from this confidant of half a century. Indeed Lord Hatherley may almost be said to have been the recipient of his friend's private journal; and Dr. Hook, for the whole period of his life, was unconsciously constructing a full, though not a formal, autobiography in the letters so regularly despatched to his old Winchester schoolfellow. Some of the reasons of the charm which these volumes owe to the writer are not unlikely to escape the recognition of the reader. There is a quiet self-suppression and a comparative absence of private opiniohativeness in the biographer's treatment of a most difficult and delicate part of his work, the contemporaneous setting of his subject. Mr. Stephens has resisted the temptation of endeavouring to compile a *Zeitgeschichte* or *Tendenzgeschichte* around the central figure of his hero. That he is not wanting in the gifts or in the natural inclination for such a method is evident in his own *Life and Times of St. John Chrysostom*. The author has also steered clear of the shoals upon which many a hopeful biography has been spoiled; although he is the son-in-law of Dean Hook, he has not obtruded upon the reader that family bias which is so often the cause of disproportion in biographies, and which ought to have no place in a life whose only claim to be published to the world is that it already belongs to the world. At the same time the world has a right to know how much of the character and activity of its best servants is due to hidden influences, and in whom those influences had their spring; and in the delightful glimpses which Mr. Stephens affords us of the mother and the wife of Dean Hook we acknowledge another illustration of one of the oldest recognized laws of comparative biography. Without such a mother as he had, Hook would scarcely have been fitted for his great work; without such a wife as he had, he must have broken down under it. The last sixteen years of Dr. Hook's life, while he was Dean of Chichester, are more briefly sketched by Mr. Stephens than his most active years at Leeds. But his biographer brings out with a few picturesque touches the great event of the downfall and rebuilding of the Cathedral spire; while the extracts which he gives from the correspondence paint the brave old man spurning the delights of a comparatively easy post to undertake the protracted labour of the great work of which we have already spoken. That the Dean, advanced as he was in life when he buckled to his *Lives of the Archbishops of Canterbury*, should have dreamt of following it up with Lives of the Archbishops of York and of Armagh, is eminently characteristic of the man.

The summaries of the ecclesiastical, political, or educational

environment of his subject, which Mr. Stephens is bound here and there to supply, are almost invariably concise, judicial, and lucid. It is only at rare intervals that we are inclined to protest against an attempt on the biographer's part to "improve the occasion." Thus, in his sketch of the dark condition of the Church of England and its clergy at the epoch of Hook's ordination, he appears to us to confound respectability with righteousness when he invites us to be horrified at the spectacle of "parish priests, especially in country places, smoking their clay pipes with village gossips outside the alehouse." Does he think that their morality would have been higher if their pipes had been made of wood or meerschaum instead of clay? Or does he think that Charles Kingsley was a low type of village parson? We do not consider it a part of the biographer's business to supply a moral application to the sermons preached by his hero, especially where the preacher is so self-asserting and so clear as Hook invariably is. We are impatient when Mr. Stephens interrupts his narrative with such useless predications as the following:—

> The wise words [cited from Hook's sermon at the Consecration of Dr. Luscombe] might well be weighed by those Dissenters, on the one hand, who seek to upset the Church of England as at present established, and on the other by those members of the Church who dally and coquet with Nonconformists, whether Protestant or Romanist.

Neither is Mr. Stephens always scrupulously careful to see that his historical judgments are grounded upon historical fact. Thus, after a glorification of "that great Apostle of Christ, John Wesley," he tells us, with a view of blackening as deeply as possible the background upon which Hook's figure is to be painted, that "the Religious Societies, which lasted from the Restoration to the reign (*sic*) of the Georges," "were stifled soon after the commencement of the Hanoverian rule." A sermon was annually preached to these "Societies for Promoting a Reformation of Manners," usually by one of the bishops, at St. Mary-le-Bow, as early as possible in the New Year, and "An Account of the Progress made by the Societies" was printed as an appendix to the sermon. "The Three-and-thirtieth Account" follows a sermon preached by the Bishop of St. David's in January 1728, and it reports considerable activity and progress. If any one can be charged with "stifling" these societies, it is Wesley himself, who sought converts amongst them, and who turned the thought of their members from practical morality to religious speculation, and from care for the public good to a more self-centred care for their own souls. These societies, instead of beginning at the Restoration, began after the Revolution, and they were so far from being stifled under the reign of the first George that they survived far into the reign of the second. We are not inclined to quarrel, however, with a writer to whom we owe so much. Mr. Stephens has alike the skill and the feeling to know when to stand aside and let the fascinating and self-asserting figure of his hero speak for itself.

DIXON'S ROYAL WINDSOR.*

As, according to political economists, demand creates supply, we presume that in some quarter or other there is a demand for Mr. Hepworth Dixon's peculiar style of writing. It must, we suppose, find admirers somewhere, else why should the author continue to supply it? To such admirers it will doubtless be a pleasure to learn that Mr. Dixon is fully himself in these two volumes of *Royal Windsor*. In the very first sentence they will recognize his manner of dashing into his subject:—

> A steep chalk bluff, starting from a river margin with the heave and dominance of a tidal wave is Castle Hill, now crowned and mantled by the Norman keep, the royal house, the chapel of St. George, and the depending gardens, terraces, and slopes.

Castle Hill, we believe, has not within the memory of man been in a condition of volcanic activity, so that we are at a loss to account for its starting with the heave of a tidal wave. Nature, however, plays strange pranks at Windsor. In his favourite singsong, Mr. Dixon goes on:—

> Trees beard the slope and tuft the ridge. Live waters curl and murmur at the base. In front, low-lying meadows curtsey to the royal hill.

Sir Artegall, we may remember, rebuked the Socialists of his day by pointing out that

> The hils doe not the lowly dales disdaine;
> The dales doe not the lofty hils envy.

But it was reserved for Mr. Dixon to represent the dales as gracefully acknowledging their social inferiority by curtseying to the hills. The whole first chapter, indeed, is pitched in a high poetic key, and is struggling, not always unsuccessfully, to form itself into blank verse. If we desired to make a collection of elegant extracts, these first few pages alone would offer a host of charming passages. The only difficulty is to choose from the lavish supply. We come upon "aged oaks, hoary with time and rich in legend: patriarchs of the forest, wedded to the readers of all nations by immortal verse." We hear how "the stream curves softly past your feet, unconscious of the capital, unruffled by the tide"; and we are invited to gaze on

> the pinnacles of Eton College, the Plantagenet school and cloister, whence for twenty-one reigns the youth of England have been trained for court and camp, the staff, the mitre, and the marble chair. Free from these pinnacles, the eye is caught by darksome clump, and antique tower, and distant height; each darksome clump a haunted wood, each antique tower an elegy in stone, each distant height a storied and romantic hill.

A little further on, we are told that "the heights all round the Norman keep are capped with fame—one hallowed by a saint, another crowned with song." In plain prose, this means that one is St. Leonard's Hill and another Cooper's Hill. In his description of the "Saxon hunting-lodge" in Windsor Mr. Dixon has unconsciously introduced a line of blank verse which sounds quite good enough to become a stock quotation among hunting men of a sentimental turn:—

> Free to the chase, yet severed from the world.

We recommend it to the attention of those writers whose business it is to chronicle, in an easy mixture of slang and poetry, the doings of the Blankshire hounds, and whose quotations are apt to be worn distressingly threadbare.

From the "Saxon hunting-lodge" Mr. Dixon passes on to the "Norman keep," and gives us an account of the part taken by various sovereigns in building, enlarging, or altering Windsor Castle. Coming down to the present reign, we find that "Her Majesty has cleared off slum and tenement from the slopes." After noting this happy reformation, we enter upon the second chapter, and with it upon the detailed history of Windsor, or rather of everybody who has had any connexion with the place, down to the marriage of Henry VII., at which point the second of the two volumes ends. First in order comes Robert of Mowbray, Earl of Northumberland, whose connexion with Windsor consists in his having there dragged out some twenty or thirty years of prison life. The hopeless nature of his captivity is shown by the fact of his wife having been allowed by a Papal dispensation to marry again in his lifetime—an incident which, however, is not mentioned by Mr. Dixon. Robert's earlier history is told at length, including his dealings with King Malcolm of Scotland. The legendary story of Malcolm's death by a treacherous thrust of the lance on which the keys of Alnwick were being offered to him in feigned submission is given as if it was undoubted history. Mr. Dixon speaks of Alnwick castle, unaware seemingly that the critical scepticism of the present age doubts whether there was a castle at Alnwick as early as the date of Malcolm's death. Earl Robert's subsequent revolt against his own sovereign is made to arise out of this slaying of Malcolm. Rufus, we are told, "sent for Mowbray to appear at court and answer for his awful deed." For this connexion between Malcolm's death and Earl Robert's fall Mr. Dixon may have authority; but Orderic, whose version has been followed by most modern historians, represents Robert of Mowbray as being "sent for," not on account of "his awful deed" in procuring the death of the King of Scots, but to answer for having plundered some Norwegian merchant-vessels. From the reign of Rufus we pass to that of "Beauclerc," as Mr. Dixon commonly calls Henry I. "Beauclerc cast his eyes on Lady Edith, otherwise Madame Maud, a daughter of the murdered Malcolm and his Saxon Queen, St. Margaret, and a little niece of Edward the Confessor." What relationship is implied by the term "little niece"? According to the genealogies, Edith was a great-great-niece, if the term be permissible, of the Confessor. In his account of Henry's courtship Mr. Dixon, following Sir Francis Palgrave, adopts the story that Edith's heart, like that of Sir Galahad, was "drawn above," and that she married only out of a sense of public duty—a story which, in Mr. Freeman's opinion, "sounds like a romance of the convent." We should prefer to put our faith in Edith's own statement, as reported by Eadmer, that, so far from aspiring to be the bride of Heaven, she was in the habit, when her aunt's back was turned, of tearing off her nun's veil and trampling upon it. It is at any rate the less commonplace story of the two. We should like also to know if Mr. Dixon has any good evidence to support the theory that when Henry, under episcopal pressure, allowed his hair and beard to be clipped, it was done "as an act of separation from the English race." As Orderic tells the story, it was rather a return to respectability, a renunciation of the wicked ways of the fashionable world. Long hair had been one of the distinctive marks of the dissolute companions of Rufus, who were not likely to have adopted the fashion out of any English sympathies. A converted Cavalier sacrificing his lovelocks would be the nearest historic parallel to Henry submitting to the shears of Bishop Serlo, who, like the Puritans of later days, appealed to the authority of St. Paul in support of his denunciations. As for long beards, the Norman Bishop took exception to them, not as being an English fashion, but, amongst other reasons, because they made their wearers resemble Saracens rather than Christians. Even before Bishop Serlo had so successfully exerted his eloquence, we doubt whether the good people of Windsor would have seen Henry "ride away, his Saxon locks about his ears, his yellow beard about his breast," because, according to William of Malmesbury, Henry's hair was black.

Mr. Dixon is much given to these personal descriptions, which in their precision of detail and glow of colour betray the practised hand of the novelist. Henry of Bolingbroke, we are interested in learning, "was a tall and handsome fellow, with a blue and laughing eye, made brighter by the bronze of his manly cheek." Philippa of Hainault is set before us as "a tall fair girl, with flesh all creamy white, and cheeks all rosy red." Good Queen Anne of Bohemia fares but ill, being unflatteringly portrayed as "fat and pink, with light blue eye and heavy flaps of cheek." In fact, as Mr. Dixon sums up, "this sister of Augustus was extremely plain." Mentally, the poor lady was, we regret to add, "limp and watery." Her husband, King Richard II., was,

* *Royal Windsor.* By William Hepworth Dixon. London: Hurst & Blackett. 1879.

it appears, as "limp" as herself. To quote Mr. Dixon's unconscious blank verse:—

> Like the fair dame, his mother, he was gay
> And indolent, perverse and bountiful.
> . . . .
> Some courage and some talent he possessed,
> But, like an infant of the south, he had
> No staying power. Once he had made his dash—
> And that with either sword or tongue—he fell
> Into his listless mood.

His father, the Black Prince, on the other hand, seems to have been tough both in body and soul—especially in body, for even "as an infant, he was huge in size, his flesh like wire." The description of Prince Hal is as pretty a bit of writing as any in the book:—

> A sunburnt man, with hair about his head
> Like raven plumes; a face of oblong shape,
> Brow arched and domed, complexion tawny red;
> Teeth white and large; eyes lion-hazel, mild
> When quiet, but of flashing fire when roused.
> . . . .
> The young man seemed an image of St. George;
> One capable of fighting like a god.

Richard Cœur de Lion, "in face and figure," "recalled the Saxon hero; for, like Alfred, he was tall and sparo, with rosy cheeks, blue eyes, and flaxen curls." The latter part of the description, we own, recalls to us not so much "the Saxon hero" as "the sweet little doll" of Kingsley's lyric:—

> Her cheeks were so red and so white, dears,
> And her hair was so charmingly curled.

Professor Stubbs, however—and who should know what the Angevin Kings were like, if Professor Stubbs does not?—avers that Richard's hair was brown, and that at the time of his accession he was struggling against an unheroic tendency to fat. We may reconcile our conflicting authorities by supposing that, like Napoleon, Richard was thin at one time of his life and stout at another. As to shades of hair, the cautious historian knows that absolute agreement on such points is not attainable. Pope held that women were "best distinguished by black, brown, or fair"; and the most advanced ethnologists, committing themselves to even fewer details, roughly divide the population of Western Europe into Melanochroi and Xanthochroi.

Albeit Mr. Dixon has given "Lion Heart" the outward semblance of a hero of romance, he resists any temptation to take a romantic view of his character, and indeed pronounces him to have "had nearly every fault of a bad man, in addition to almost every vice of a bad king." The chapters describing the struggle against Richard's Chancellor, William of Longchamp, are among the best in the book. For, despite its manifold absurdities, the work has a certain merit. It is at any rate not dull. When Mr. Dixon has good authorities to guide him, and good material out of which to construct his narrative, he can tell a story in a dashing, slashing, historical-novelist manner which is not without its attractions. His art at the best is that of the scene-painter; but, like scene-painting, it is effective, though often tricky and exaggerated. Even if we believe that William of Longchamp was as hideous and deformed as his enemies made him out to be, we get tired of having him perpetually styled "the dwarf," "the pigmy," "the mannikin." The affectation of calling Margaret of Anjou "the Daisy Queen" mars the account of the struggle of York and Somerset, which otherwise is written in a comparatively quiet and reasonable manner. In the heartrending picture of Henry VI.'s childhood some of the details are, we trust, due only to Mr. Dixon's love of exaggeration:—

> The infant king was left at Windsor Castle in the charge of Alice Boteler, while his restless mother, and his lawless godmother, were racketing about the world. Alice was allowed to slap the child; and Warwick, now his governor, was allowed to flog him. Nurse and governor both exercised their powers on the deserted boy. That side of the young monarch's life was genuine; all other sides were empty show and meaningless play. Chancellors knelt to him, but Alice slapt his hands; ambassadors parleyed to him, but Warwick broke the cane on his back.

We should like to be quite sure of the evidence for this last statement before we consent thus to regard Warwick as the Squeers of English history. That poor little King Henry, by one of the quaintest exertions of monarchical power on record, did give first to Dame Alice, and then to Earl Richard, authority "reasonably to chastise us," is undoubtedly true; but, if Mr. Dixon's information be correct, the Earl at least had rather stern ideas of reasonableness. The charge of undue severity has been before now brought against Warwick, though not with Mr. Dixon's particularity, and seems mainly to be founded on the meek and subdued disposition of Henry in after-life, and upon Warwick's well-known application to the Council for increased powers. As, however, in that document fear is expressed lest the Royal pupil "wol conceive ayeins the said Erle, or eny other that wol take upon him to chastise him for his defaultes, displesir, or indignacion therfore, the whiche, without due assistence, is not easy to be born," it is evident that Warwick was aware that severity on his part might thereafter have injurious consequences to himself, and thus had a strong inducement not to exceed the bounds of what was considered reasonable and necessary discipline. At any rate the general impression which Mr. Dixon conveys of a "deserted" and roughly-treated child is inaccurate. Henry may have been, as Professor Stubbs supposes, over-taught and over-worked, and, after the fashion of the age, the rod may have been unsparingly employed to hasten the development of his precocious but short-lived intelligence; but it is plain that there was no lack of care and good intentions on the part of his guardians. The difficulty of shaking off the trammels of Shakspearian tradition must be Mr. Dixon's excuse for saying that Cardinal Beaufort "died in misery and despair." It is now generally acknowledged that the Cardinal died in the most decorous and dignified manner, after hearing his own funeral service and requiem mass, having his will read out, and bidding farewell to all his household.

We have not space left to do more than mention the chapters in which Mr. Dixon traces the origin of the cult paid to St. George. They are interesting, but would be improved by compression. Much pains have been spent upon the history of the Order of the Garter, and we remark with satisfaction that though in some other parts of his work Mr. Dixon betrays a hankering after unnecessary scandal, he sternly rejects the tales about Lady Salisbury. On the whole, we lay down *Royal Windsor* with the reflection that if Mr. Dixon would eschew halting blank verse, would write in a moderately calm and rational manner—which he can do now and then, though he is continually relapsing—and would abstain from exaggeration and flights of imagination, he might attain to a fair position among the lighter order of historical writers. But to ask him to do all this would perhaps be to ask him to be no longer himself.

CHURCH'S ESSAY ON DANTE.*

All lovers of the study of Dante will be gratified by the publication in a separate and independent form of Dr. Church's well-known essay, which first appeared more than twenty-five years ago in the pages of the *Christian Remembrancer*, and was subsequently reprinted in a volume of collected essays and reviews. Those who are about to enter upon that study may commence it under the best auspices by making themselves acquainted with the very full, learned, and eloquent treatise now rendered accessible to them. It omits nothing necessary for the completion of its design, and affords a summary of the public and private life of the great Italian whose place in literature is so singular. It explains the circumstances of the time in which he lived, and their influence upon his thoughts and character; giving also an admirable account of his works, and of the way in which they stand related to each other and to their author. No attempt to relate the inner life of Dante as boy and man, no version of his unhappy connexion with the bitter politics of the city and of the country which he loved so well, no criticism of his writings in prose or verse, could be intelligible in which each of these matters should be treated singly and apart from the others. The esoteric life, the political life, and the literary life must be taken together, as three strands constituting one united cord; they must never be parted; and, if any one of them were to be relied upon as the clue to hold by in endeavouring to find a path through the complicated maze of Dante's existence, it would snap in the hand, and leave the inquirer perplexed and helpless. He would soon discover himself to be "in a dark wood, where the straight way was lost"; a jungle of Aristotelian and scholastic philosophy, of mediæval theology and history, of Guelf and Ghibelline politics, of local and personal feuds and hatreds, of scriptural and classical learning, to be understood frequently in a sense far removed from the modern one, and the whole tangled with allegorical allusions, and full of peculiar personal recollections and experiences.

Dr. Church has fully understood the right mode of conducting a new comer among all the difficulties which encompass the journey through the life and writings of Dante, and his leadership may be securely adopted. He never loses sight of the inseparable connexion between the individual man and what he wrote and did. He does not allow himself to be led astray by false and fanciful interpretations, but follows Dante's own explanation of the way in which the consecutive evolution of his writings took place. The passion of the tender and impressionable boy for the young Beatrice was the origin of the *Vita Nuova*, as true a love story as ever was written, strange as some of its fancies are, and mystical as some of its meanings may be. Through its wonderful prose and verse, the little girl first seen in her crimson frock grows into the beautiful woman, dies, and becomes the beatified guide who is to save Dante from destruction at the beginning of the *Divina Commedia*, and is afterwards to be his guide through Paradise. The *Convito* is a work of later years, written by the man to whom the boy of the *Vita Nuova* was father, a man who had read, and had battled with the troubles of the world; who had become a politician and a soldier, who was an exile from his country, and who had experienced the disappointment of discovering how far the life of action in which he had to move, and the associates with whom he was thrown, differed from his own high ideal of right and duty. It is in this work that Dante lays down rules for the due interpretation of his writings—rules which some of his commentators have so entirely ignored and transgressed. He points out the distinct existences of literal, allegorical, moral, and spiritual meanings; but enforces the importance of the literal meaning, which must always lie under any allegorical interpretation. He refers to the *Vita Nuova*, and

* *Dante: an Essay.* By R. W. Church, M.A., D.C.L., Dean of St. Paul's. To which is added a Translation of the "De Monarchia," by F. C. Church. London: Macmillan & Co.

maintains his continued love for Beatrice, whose praises and whose memory are always in his thoughts. On her death he found his chief consolation in study, and he dwells upon the pleasure he derived from it, in soothing his grief and in extending his knowledge. In this manner the recollections of his lost love became naturally entwined with the subjects of his studies, and she assumes gradually a new existence as the intellectual mistress of his soul. He distinctly mentions the allegorical or double form in which she is thus made to appear. Then in the *Commedia* a further and higher change takes place. In the great poem Beatrice becomes a personification of spiritual knowledge or theology, and her image in Dante's heart receives its most exalted phase of glorification. The *De Monarchiâ* lies somewhat out of the direct line in which the *Commedia* proceeded through the *Convito* from the *Vita Nuova*, but when rightly considered its connexion with the other works becomes clear. The treatise *De Vulgari Eloquio* is almost purely literary; but it was a fitting thing to be written by the man who broke the sort of spell which compelled the use of Latin for serious composition, and who had himself intended to employ it as the language of his great poem; the first to resort to the tongue of the common people for the purposes of an important literary work, and who wrote so that the *Commedia* should be understood by them.

Dr. Church opens his fine essay with the *Divina Commedia*, as one who should give the first sight of a rich country or a noble city from its highest eminence or loftiest tower; and he speaks in a manner worthy of its transcendent supremacy. He rightly calls it one of the landmarks of history, and adds:—

> More than a magnificent poem, more than the beginning of a language and the opening of a national literature, more than the inspirer of art and the glory of a great people, it is one of those rare and solemn monuments of the mind's power, which measure and test what it can reach to, which rise up ineffaceably and for ever as time goes on, marking out its advance by grander divisions than its centuries, and adopted as epochs by the consent of all who come after.

Dr. Church traces the progress of Dante's early life, his studies, and his capacity for literary distinction; and points out how it was the enforced and painful activity of his life which brought out the greatest faculties of the poet, saving him perhaps from a dream of inglorious contemplation:—

> It was the factions of Florence which made Dante a great poet. But for them he might have been a modern critic and essayist born before his time, and have held a high place among the writers of fugitive verses, in Italy a graceful, but trifling and idle, tribe. . . . He might have thrown into the shade the Guidos and Cinos of his day, to be eclipsed by Petrarch. But he learned in the bitter feuds of Italy not to trifle; they opened to his view, and he had an eye to see, the true springs and abysses of this mortal life—motives and passions stronger than lovers' sentiments, evils beyond the consolations of Boethius and Cicero; and from that fiery trial which without searing his heart annealed his strength and purpose, he drew that great gift and power by which he stands pre-eminent even among his high compeers, the gift of being real. And the idea of the *Commedia* took shape, and expanded into its endless forms of terror and beauty, not under the roof-tree of the literary citizen, but when the exile had been driven out to the highways of the world, to study nature on the sea or by the river, or on the mountain track, and to study men in the courts of Verona and Ravenna, and in the schools of Bologna and Paris—perhaps of Oxford.

Then begins a full and fervent exposition of the events and feelings of the time, and of the story of Dante's fitful life. We are told how he was born in the year of the decisive battle of Benevento, which established French influence in Italy, set up the Papal power, excluded that of the Emperor, and drove the Ghibelline party from Florence. There is an excellent analysis of the claims and constitution of the two great factions which then divided Italy, and in picturesque language it is told with what a frightful spirit of extermination the ascendent Guelfs pursued their advantage in the city of Dante's birth. The famous split of the Guelfs into Blacks and Whites followed, and the fortunes of Dante became involved in the general civil strife, ending with his banishment, and subsequent wanderings in exile for the rest of his days. Dr. Church then returns to the great poem:—

> The *Commedia*, at the first glance, shows the traces of its author's life. It is the work of a wanderer. The very form in which it is cast is that of a journey, difficult, toilsome, perilous, and full of change. It is more than a working out of that touching phraseology of the middle ages, in which "the way" was the technical theological expression for this mortal life; and "*viator*" meant man in his state of trial, as "*comprehensor*" meant man made perfect, having attained to his heavenly country. The writer's mind is full of the recollections and definite images of his various journeys. The permanent scenery of the *Inferno* and *Purgatorio*, very variously and distinctly marked, is that of travel. The descent down the sides of the Pit, and the ascent of the Sacred Mountain, show one familiar with such scenes—one who had climbed painfully in perilous passes, and grown dizzy on the brink of narrow ledges over sea or torrent.

Several of the most striking of these local reminiscences are mentioned, as well as passages in which Dante dwells upon local names and images, and brings into use the observations of a practised voyager. Dr. Church's pages, in which he shows his readers how to appreciate the wonders and beauties of the *Commedia*, entitle him to rank among the ablest of the critics who have devoted themselves to the study of Dante. He remarks the vast comprehensiveness of the design, and the novelty of combining so many objects in a single poem. The main character and scope of the poem are obvious enough, as a vindication of divine justice; but this purpose does not proceed without interruptions and many passages which to modern feelings seem singularly inappropriate in so serious a composition. There are allegories, but their meaning must not be strained too far; and there are bits of history and personal anecdotes which it would be impossible to find in a work of such high and important design in the present world, whose writings are supervised by incessant criticisms and an established code of conventionalities. But to understand and appreciate the *Commedia* it must be taken and read as a whole. Many readers do not get beyond the first five cantos of the *Inferno*; some may get as far as the end of the first part, but go no further. These have not done wisely or well; the beauty of the poem increases through the *Purgatory* and *Paradise*, and those who persevere to the end, and for the third time read the word "*stelle*" in its appointed place at the end of each canticle, will find that they have their reward, and have added to their intellectual happiness. They have acquired a higher faculty of perceiving and enjoying expressions of the grandest thought, the most marvellous descriptions, and the choicest language. To have mastered the *Divina Commedia* is an event in a lifetime, as the production of it was an event in the history of literature; and those who have taken the trouble to do so look back to it as a thing to be remembered with pride and gratitude, and rejoice in the possession of an abiding advantage and a treasury of knowledge and recollections of which nothing can deprive them. Those who enter the portals of the great poem with the intention of passing through all its circles, and rising through the heavenly spheres, will find that they have not to abandon hope, but will find their hope realized beyond their highest expectations.

The translation of the *De Monarchiâ* into English, now done for the first time by Mr. F. C. Church, is a valuable addition to the essay on Dante. It is a work so strongly and strangely illustrative of the age which produced it that it ought to attract the attention of the larger circle of readers to whom it is now presented. It is in form something between an abstract treatise on government and a pamphlet or one of those political articles in the modern periodical which now come, not singly, but in battalions. The first book treats of the subject generally, and explains how a temporal sovereignty is essential for the well-being of the world, and that it must be administered with peace and justice and well-ordered liberty for its ends, and by a single, duly qualified, and universal power. And when these conditions were fulfilled, when Augustus was Emperor, a sole ruler, at the head of a perfect monarchy, and in a time of general peace, the world was ripe for the appearance in it of the Son of God. The second book shows in detail that the Roman Empire was divinely established as being in its origin and through its founders the fittest power to rule over all the peoples. For the Roman nation was the noblest, and most worthy to be preferred before all others; and the rise of its power by a succession of miracles proved its sacred right to the possession of supreme dominion. And this is confirmed by the manner in which the struggle for ascendency took place with rival nations, in which the ultimate victory of the Romans proved their title to be the legitimate heirs of the universal sovereignty. The book ends with another appeal to the birth and death of Christ—to the first as showing that the authority of the Roman Empire was just, and to his death under a Roman official as confirming the jurisdiction of the Roman Empire over all mankind. The third book deals with the pretensions of the Papacy to confine and to control the temporal power, which has previously been proved to subsist upon grounds as sacred as those upon which it founds its own claims to supremacy. Each of the two divinely ordained powers should perform its own functions—"the supreme Pontiff to lead mankind to eternal life, according to the things revealed to us; and the Emperor to guide mankind to happiness in this world, according to the teaching of philosophy." Mr. Bryce has given a short summary of this treatise in his *History of the Holy Roman Empire*, which so admirably expounds the mediæval ideas on the subject; and has pointed out the strange nature of the arguments which then passed current, and the childish faith in which the supposed endowment of the Church by Constantine is accepted, as well as the belief that the Emperor Henry VII., although a German, was the lawful successor to the power exercised by Augustus and Justinian.

The relation of the authorship of the *De Monarchiâ* to that of the *Commedia* is best shown by recollecting the part played by Virgil in the latter as the representative of Roman government and literature, and by referring to the end of the *Inferno*, where Brutus and Cassius, the assassins of Julius Cæsar, are made to occupy the lowest and most infamous place of punishment along with Judas Iscariot, where they jointly suffer as being guilty of the greatest treasons in the religious and civil history of the world. Reference should also be made to the magnificent lines of the *Paradiso* in which Justinian, as the great lawgiver, is made to recount the rise and progress of the power of Rome. This is one of the grandest and most elaborated passages in the whole poem, and it may perhaps have been unconsciously present in the recollection of a great living poet when he wrote his stirring narrative of the successive triumphs of the British arms under Wellington. There is in both the same sense of an impetuous rush of continued successes, and in both the same truth and precision of description in few words; the same union of the highest imaginative power with the closest adherence to reality which here, as throughout his poems, constitutes a remarkable point of resemblance between Tennyson and Dante. Further, too, may be noted the similarity of the lines

> Dove sentia la Pompeiana tuba,

and in the "Ode on the Death of the Duke of Wellington":—

> Last, the Prussian trumpet blew.

It will not be out of place here to notice the latest contribution of the Italian press to the honour of Dante. It is a minute edition of the *Divina Commedia*, printed in 1878 at Milan in

microscopic type. The little volume contains 499 pages; it is two inches and two-tenths long, an inch and a half broad, and eight-tenths of an inch thick, and weighs one ounce and a quarter. It is the smallest edition of a great work that has been ever produced, and is a marvel of typography.

YACOOB BEG KHUSHBEGI.*

MR. BOULGER has made a praiseworthy attempt to treat a subject which lies under peculiar disadvantages. The country described has been hitherto removed from the sphere of European politics, and only indirectly can influence the course of events on our Indian frontier. The materials for the compilation of the work are not always trustworthy, and they occasionally fail altogether. And, while a good deal of past history is obscure and contradictory, the future is wholly conjectural. Still any book which tends to throw light on the Central Asian problem is entitled to a hearing; and the author deserves credit for research, pains, and general accuracy. The effect of the narrative is occasionally marred by abrupt transitions from one subject to another; and several of the chapters tell us but little about Yacoob Beg himself, but are occupied with internal revolutions, Chinese conquests, and Russian intrigues. The style, like the subject, is unequal. Now and then the author is animated, and almost rises to eloquence; but in other places the diction is rather wanting in precision and point. "Retrocede," in the sense of giving back, is a novelty. Whatever may be the issue of the Anglo-Turkish Convention, it is to be hoped that no member of the Opposition or the Ministry will gravely propose to "retrocede" Cyprus. The following is a curious sentence:—"Twenty years' experience had placed every muscle at his complete command." This does not mean that Yacoob Beg had universal control over all the thews and sinews of enterprising adventurers in Kashgar. The sense as shown by the context is, that familiarity with intrigues had enabled Yacoob to command his own countenance and to dissemble his ambition. Habitulla Munshi is a misprint, we apprehend, for Habibulla. But, on the whole, there are much fewer errors than might have been looked for in a work which deals almost exclusively with strange localities and unfamiliar names.

There seems almost as much difficulty in defining the ethnological features of Kashgar as there is in tracing its historical revolutions. According to Mr. Boulger, in Kashgaria and the adjacent countries the Aryan and the Turanian meet. Besides the great tribes of the Kirghiz and the Kipchak who are Usbegs, there are the Tunganis or Dungans, and it is still a moot point whether they are a distinct race or Calmucks who at some time have become converts to Mahommedanism. Then we hear of Tajiks or Persians, who have become Tartars without absolutely losing their Aryan characteristics. Out of these mixed and jarring elements, and from disjointed episodes of wars, subjections, invasions, and risings, Mr. Boulger compiles a history which we may epitomize somewhat as follows. Nearly ten centuries ago the rule of China extended beyond Kashgar to the very borders of Khokand and Cashmere. As its ascendency waned the country was convulsed by factions and anarchy, until the Arab conquerors made their appearance and swept everything before them in Asia and Europe. How discordant fragments and wild tribes were consolidated and welded together for a time by Jenghiz Khan can never be told more effectively than in the pages of Gibbon; and Mr. Boulger, who does justice to the great historian as an authority in Central Asian matters, will forgive us if we say that his readers might have been referred to the *Decline and Fall* for this part of his narrative. But—after the usual convulsions of Oriental kingdoms whenever the inheritance of a single strong ruler is claimed by half-a-dozen successors and rivals—the Chinese again appear on the scene. This was in the beginning of the last century. They were invited as allies or protectors, and they naturally remained as conquerors. About the year 1760 these foreigners had occupied the principal cities, had put down rebellion, had massacred a large number of innocent inhabitants, and had filled their places by importing settlers from Chinese provinces. The sketch given of the framework of Chinese administration suggests to us the parallel of our Anglo-Indian dominion. There was a Viceroy at Ili or Kuldja, with a Lieutenant-Governor at Yarkand. There were military commanders in the chief cities, and the higher judicial and executive offices were reserved to men of the conquering race. The lesser appointments were open to Mahommedans, and by them revenue was collected, customs levied, and justice dispensed. Mr. Boulger draws a seductive picture of the benefits of Khitay rule. The Chinese raised dykes and canals, constructed roads, manufactured carpets, explored mines, consumed coal, encouraged trade, and filled crowded bazaars with produce and the open country with works of engineering skill. In fact, we are asked to believe that the run of prosperity was prolonged till it became tame and monotonous. We have no doubt that Mr. Boulger writes with perfect sincerity, and that he can produce some fair authorities for his preference of a foreign over an indigenous rule. But somehow, about fifty years ago, Khans and Aksakals, or the heads of the Mahommedan community, revolted, and after some successes chequered by savage reprisals, Khudayar Khan rose to power in Khokand, and a greater triumph was achieved in Kashgaria by Yacoob himself as the Lieutenant of Buzurg Khan.

This is the man who has become known as the Khushbegi and the Atalik Ghazi. The former term means the lord of the family, and the latter signifies literally "the guardian who has slain infidels in battle." A large portion of the work is from this time devoted to the birth, rise, and character of the Khushbegi, and it furnishes us with the most interesting chapters. Mr. Boulger, premising that Yacoob was born near Samarcand, calls him a Tajik, implying that his origin is Persian. Vambéry certainly says he was a Persian Sart. In a biography written by one of his generals he is described as a descendant of Timur. But it is also certain that, while the Tajiks have prominent features and long flowing beards, Yacoob struck the members of the embassy to Kashgar as having the round features of the Usbek. Whatever may be his lineage and race, he furnishes another example of those who, when destined for a religious and peaceful life, take naturally to the profession of a soldier. He became successively chamberlain to Khudayar Khan, a commander of five hundred soldiers, and the governor of the Ak Musjid or the White Mosque on the Jaxartes. Here in 1853 he distinguished himself by offering a stubborn resistance to General Perovsky. We next find him as Governor of Kurama under Khudayar Khan, and at this stage of his career he seems to have acquired the character of a gallant soldier, an orthodox Mahommedan, and a strict disciplinarian. But his talents only received their full development in the recovery of Kashgaria after the year 1864. His success here was doubtless much favoured by the previous risings of the Tungani Mahommedans against their Chinese oppressors; and Mr. Boulger, who is strongly prepossessed in favour of the latter, narrates with pride how a Chinese Amban blew himself up with all his family and servants rather than fall into the hands of some beleaguering Mahommedans. But it is not less remarkable that Yacoob had to found his dominion on the defeat first of the Chinese, and next of his own fellow-religionists. His success against the former was probably facilitated by a marriage with a Chinese wife. The latter gave way to his dash, readiness, and energy, aided as he was by the priesthood; and after cities and fortresses had fallen before his vigorous attacks, his rule seems to have been established over the greater part of the country by the end of 1867. In all these operations we hear very little of Buzurg Khan. He was the familiar type of an incapable sovereign eclipsed by a subordinate with rare talents for military and civil affairs. It is a consolation to think that Buzurg Khan was not put to death by his own general, but, after a short imprisonment, was banished the country, and is now, we believe, residing with his family somewhere in Khokand.

For a period of about twelve years Yacoob Beg was enabled to give to a large portion of Central Asia the benefits of a settled though strict and rigorous rule. No one will say that Mr. Boulger has unduly exalted the subject of his biography. Indeed he more than once draws an unfavourable contrast between the severity of the Mahommedan administration and the humanizing and expanding tendencies of the Chinese Ambans. But though we are inclined to think that he over-estimates the Chinese as a governing race, his chapter on Yacoob Beg's administration does justice to that ruler's capacity for the work of organization and progress. Yacoob drilled and disciplined a large civil staff. He presented to his subjects the spectacle about which Indian administrators now and then dream, of a monarch who held a public durbar to which the meanest had access, who received all kinds of petitions, who passed orders by a sort of instinct on piles of reports, who punished delinquent officials for malpractices, who whipped vagrants and beggars, drove idlers to say their prayers at mosques, checked sedition, and forced women to go about in modest veils. In his foreign policy he displayed consummate tact. Russia, we may be quite sure, had her eye on Kashgaria, and readers of the Central Asian Blue-book will not be surprised at hearing that Russian officials were instructed to demand the surrender of Kirghiz marauders and free access for Russian goods to Kashgar. The answer of Yacoob, quoted at p. 185, reminds us more of that given by Van Beuning to the Minister of Louis XIV. than of the shifts and circumlocutions of Oriental diplomacy:—"J'ignore ce que veut le roi; je considère ce qu'il peut." On another occasion Yacoob allowed a Russian merchant to reach Kashgar in perfect safety with a consignment of merchandise. The clerk in charge was honourably treated but carefully watched, very much as Sir D. Forsyth was during his first visit. But when it came to disposing of the goods, the whole cargo was quietly bought up by Yacoob himself, the seller being paid in a depreciated Chinese currency. The Atalik at once saw through the Russian proposals—their pretences of commerce, their honeyed phrases, and their cool demands for consular agents; and he showed that he could be by times civil and defiant, candid and ironical, determined in resistance and yet fair of speech. Very different was the treatment experienced by the English Envoy on his second appearance. Nothing could have been more princely than the hospitality lavished on our Embassy. The members were comfortably lodged, were fed at the expense of their host, and were allowed to take long rides and excursions in all directions. The result of Sir D. Forsyth's last visit, it is well known, was a treaty which provided for the development of mercantile enterprise between India and Kashgar and Yarkand, for the appointment of our own commercial agents in suitable places, and even for the trial of civil and criminal cases in which British subjects might become involved. Whether the Atalik could have maintained his ascendency, and have transmitted his rule to a successor in the face of Russian aggression or Chinese revenge, may be doubted. But his life was cut

* *The Life of Yacoob Beg, Ameer of Kashgar.* By Demetrius Charles Boulger, Member of the Royal Asiatic Society. London: Allen & Co. 1878.

short, like that of many a Khan or Beg, by assassination in the spring of 1877. The assassin is credibly reported to have been Hakim Khan Torah, the son of Yacoob's old master, Buzurg Khan. We prefer this version to a story which says that he died of fever. His interment was characterized by one of those horrible tragedies which seem to belong to the dark ages or to Asiatic successions. The elder son of the deceased met his father's coffin, knelt down by it, and then shooting his own brother dead with a pistol, proceeded to put his escort to the sword.

Those who from personal intercourse seem best qualified to judge of Yacoob's character, would, we suspect, assign him a higher place than the author has done. But the Chinese generals had already entered on their career of reconquest before Yacoob's fall; and after his death it became comparatively easy for them to overrun the whole country. Rivals fought instead of uniting against the common invader. Tso Tsung Tang, the Chinese Viceroy and Commander-in-Chief, showed himself a man of capacity, and Kin Shun, otherwise known as Liu Kin Tang, pressed forward with great energy and rapidity, and taking one town after another, enabled Tso Tang to retake Aksu. We much fear that the Chinese reconquest was disfigured by the massacre of captured garrisons. But these details, and worse stories, rest on the reports of refugees, and all we can be certain of is that the subjugation of Yacoob's principality is complete and final. Against skilful generals and troops armed with weapons of precision, the fabric erected by the Atalik Ghazi at once crumbled away; and whether the Indian Government will renew its commercial intercourse with the present rulers of Kashgaria depends on a variety of contingencies which it would be vain at present to forecast.

China is, however, now brought face to face with Russia, and Mr. Boulger seems to think that the Government of Pekin may make a serious attempt to recover Ili or Kuldja north of the Tian Shan mountains. Russia, we are reminded, obtained possession of this State in 1871, by conquering a certain Abu Oghlan, who had set up for himself and maintained his rule there for about five years, encouraging the Kirghiz tribes to revolt against Russia, keeping Russian merchants at a distance, and enslaving more than seventy thousand of his own subjects. Long before the above-mentioned date, or in 1851, the Emperor of Russia had been party to a treaty which allowed him to appoint a Consul, and to send merchants to trade at the cities of Ili and Tarbatagai at certain times of the year. Mr. Boulger talks of a flaw in the title of Russia. For anything that appears to the contrary, Russia's title to Kuldja is that familiar to Anglo-Indian officials in the early days of the Punjab administration. Settlement officers, when asking for title-deeds to lands, were repeatedly told that the owner acquired his acres, *ba zor-i-shamshir;* and the "Power of the Sword" seems to be the only parchment deed which Russia can exhibit for Kuldja, as well as for Khokand and Khiva. We repeat, in conclusion, that the author deserves credit for his compilation, and think that readers may derive pleasure from the laborious career of the principal figure in the book, who to borrow Mr. Tennyson's diction, rose suddenly through a little arc of heaven, and without having wandered far, shot quite as suddenly into darkness.

ROBERT DICK OF THURSO.*

HAPPY as he is in the handling of self-made men, Mr. Smiles could hardly expect to find another Scotch naturalist whose biography would captivate readers like that of Thomas Edward, shoemaker of Banff. He could not but admit that there is a stronger fascination in the branch of natural science which tells of animals in their everyday life than in that which deals with their fossilized state or their contribution to the formation of strata. Animal life replete with instinct and sagacity will always attract, and it needs not a Landseer to depict nor a Buckland to narrate, for the popularity of the subject never flags; but it is quite a different affair to treat of dead matter, and to theorize on the crust of the earth, its antiquity, growth, and assimilation. Mr. Smiles has done all he could, and no one else could have done more, for the honour and glory of Robert Dick, baker of Thurso, geologist and botanist; but we are disposed to think he has somewhat fallen between two stools. Not that it was his fault; but there was not sufficient variety or amusement in the material at his disposal to satisfy the requirements of general readers, whilst scientific folk will be disappointed at the lack of scientific lore and the mere glimmer of serious information. It does not necessarily follow that because Robert Dick worked hard, as most enthusiasts do, in a cause he loved, and devoted all his leisure to riding his hobby, science was therefore a gainer to any great extent. It is clear, however, that he was a man of genius and intelligence, and it is also clear that by his own careful researches he was able to correct errors which had been allowed to stand for some time in the works of recognized authorities. He would accept no statements about geology on trust, or until he had read them, as he said, with his own spectacles. Indeed he considered geology had not yet attained the dignity of a science, so little was there known, and that imperfectly, of the earth's surface, to say nothing of its depths. A bare list of his discoveries in a book of this sort would have conveyed little idea of their value; so, in the final chapter, Mr. Smiles has introduced the more important of them amongst the personal characteristics and reminiscences of the discoverer, and in language as non-technical as possible.

Robert Dick was born at Tullibody in 1811, and was the son of an officer of excise. He lost his mother when he was quite young. There are no boyish incidents recorded of his school or home life, such as those which enlivened young Edward's early years; no adventures with snakes, polecats, or "beasties"; no feats or perils of any sort. At school he was an apt pupil; when verses were given him to learn by heart as a punishment, he mastered them so rapidly that they were useless for the purpose; whilst he showed such promise in the study of languages that his father was advised to send him to college. Out of school, though he read everything he came across, he was fond of fun and sport, and was strong and active for his age. When he was ten years old, his father married again; and, as he married the daughter of a brewer, he had to change his place of residence, since he could not, being an exciseman, inspect his father-in-law's brewery. So the family moved, and young Dick went to a school kept by a one-armed master, who had taken to teaching because he was physically disabled for any other business, and whose chief accomplishment seemed to be mending pens, which he held under the stump that did duty for a second arm. As soon as his stepmother had children of her own, she began to ill-use the others to such an extent that they had to quit the house, and Robert Dick, instead of going to college, was apprenticed at the age of thirteen to a baker at Tullibody. So far he had learnt reading, writing, arithmetic, and a little Latin; all other knowledge that he picked up during life was of his own seeking and acquiring.

A baker's life was not an intellectual one, nor did it offer much variety or interest from day to day; still on those afternoons when he had to deliver bread in the neighbouring villages he was able to cultivate a boyish taste for observing the growth of plants. His apprenticeship lasted three years and a half, during which time he received no wages from his employer, but only board and lodging. In 1828 he went to Leith as a journeyman baker, thence to Glasgow, and then to Greenock, and so three more years passed. Wages were so low and the labour so arduous that his father advised him to start a shop on his own account at Thurso, there being at that time but three bakers' shops in the whole county of Caithness. Here then, at the age of twenty, and in the northernmost town of Great Britain, Robert Dick settled for life. Up to this point nothing had occurred to suggest the probability of his becoming a man of mark; he had always been fond of reading, and he gratified his taste for botany whenever an opportunity offered; but there is not a single incident or saying recorded during the whole of his youthful career from which any promise could be drawn for the future. In one respect he certainly was not disadvantageously placed. Few can command such a view as Robert Dick enjoyed from his shop in Wilson Lane. Directly across Thurso Bay the Orkney Islands were visible in the distance, while to the right and left respectively rose the precipitous rocks of Holborn Head and the lofty cliffs of Dunnet Head. There was nothing but sea between Thurso and the coast of Labrador, and in his rambles he used to find strewn upon the beach logs of mahogany from Mexico, or tropical seaweed from the West Indies, brought thither by the Gulf Stream and ocean currents. Here he lived for the next thirty years the life well-nigh of a recluse. He made no companions, and his natural taste for roaming about the country by himself had been encouraged by his experience of home life, for his social feelings had become so blunted by his stepmother's unjust treatment that he once remarked long afterwards to a friend, "All my naturally buoyant youthful spirits were broken. To this day I feel the effects. I cannot shake them off. It is this that still makes me shrink from the world." He never married. Three or four years after he had settled in Thurso Mr. Aikman, his old employer, wrote to him, "Mrs. Aikman sends her kind respects to you. She is happy to think you are still a bachelor, as her family is mostly girls." But he was not to be tempted. It is said that he once made an offer to a young lady and was refused. He would not be refused again, and became more companionless and given to solitude than before. He engaged a thrifty Scotchwoman as his housekeeper, and she remained with him until his death, and is living now to testify to "the maister's" good points. He said of her that "she neither smoked, snuffed, nor drank; she was just as tough as a rigwoodie, and could almost do without sleep."

The early part of his life at Thurso was divided between conchology and botany; he was either collecting shells and molluscs on the shore or busy with what books he could afford to get in his silent household. It was then, too, that he first gave his attention to entomology. In nine months he collected 256 specimens of beetles, 220 of bees, and 240 of butterflies, and a strange figure he must have presented on these excursions in his chimney-pot hat, swallow-tailed coat, and jean trousers. Sometimes he got the village boys to help him, and paid them well when they brought him fine specimens; they regarded him as rather mad, but they got to like him, and by degrees he acquired a local reputation for his knowledge of insects. His baker's life allowed him plenty of leisure time, for, after baking the bread early in the morning and leaving his housekeeper to sell it, he had the day before him free to pursue his tastes by the seashore until the hour for the "setting of the sponge" in the evening for the next day's batch. Later on, and when, we presume, he had taught his housekeeper to look

* *Robert Dick, Baker, of Thurso, Geologist and Botanist.* By Samuel Smiles, LL.D. London: John Murray. 1878.

after the baking, he used to take walks of forty or fifty miles during the summer nights for the purpose of gathering some favourite plant; for in that latitude it is light nearly all through the night during the summer. In course of time he had mastered the botany of Caithness, having thoroughly mapped out the county and studied its plants in detail. Amongst them he discovered the Hierochloë borealis, or Northern Holy Grass, so called because in Norway and Sweden the people used to strew the churches with it. It had been supposed by botanists then living that the plant was not a native of Great Britain, and it was not without hesitation that the authorities gave credence to Dick's discovery. For this and for the specimen of the plant he sent to the Botanical Gardens he received the thanks of the Royal Society.

On one of his night expeditions he was taken for a salmon poacher. A gentleman had gone out to see that his keepers were at their posts, and to try to detect the poachers of whom he was in search:—

> Just at the break of day, an hour or more before sunrise, the watcher saw the figure of a man on the horizon, some hundred yards distant. He shrank down, and crept forward, watching the man's movements in the grey dawn of morn. He was seen close by the river's side, prowling up and down the banks. Surely this must be a poacher. The man moved on. When he appeared on some high bank, the watcher hid himself so that he might not be seen between him and the horizon. He crawled forward on all fours, stalking the poacher as he would a deer. At last, after nearly two hours' stalking and dodging, the man suddenly disappeared in some low crevices in the rocks, just below Dirlot Bridge. The sun was just rising; the watcher saw him crouching down, as if hiding something amongst the ferns. Of course it must be a salmon! With beating heart, he suddenly rushed up to the man, and shouted, "Now I have caught you poaching!" The man's back was towards him. He was intently gazing on some object before him. He turned round in a composed manner and said, "No, sir, I am not poaching; I am only gathering some specimens of plants!"

After spending many years in studying shells, grasses, mosses, and ferns, he took up geology. Here, too, all his knowledge was gained by personal observation. He would not accept the statements of writers who, he was fond of saying, had acquired their information when driving across the country in gigs, or who, having started theories of their own, were wont to fit their so-called facts into them. As for geological maps, he "handed them over to the devil, as the most detestable pieces of imposture ever obtruded on a discerning public. 'Discerning indeed!'" Sir Charles Lyell had said, in his *Elements of Geology*, that very few organic remains had been found in the boulder clay throughout Scotland; but the result of Dick's own examination was that marine shells existed in nearly all the sections he had met with. To be certain, however, that these organisms were not confined to his own immediate neighbourhood, he set out to walk to Freswick and back, a distance of forty-eight miles, having only fifteen hours to allow for the whole expedition. But he had his reward. Section after section was found to be crowded with marine shells, and he was able to send Hugh Miller a list of twenty-four that he had found in this Caithness clay, notwithstanding the assertions of high authorities that there were none.

Towards the end of his life he had many reverses. His health gave way, and he suffered severely from rheumatism, aggravated, no doubt, by exposure to sea and rain when hammering for fossils; and his eyesight also failed him. Nor did his business prosper; bakers had increased and multiplied in Thurso until there were six masters and thirteen apprentices in the place, and their enterprise drew away his customers, whilst the loss of a cargo of flour at sea brought him to the verge of despondency and poverty. During his last illness his housekeeper urged him to send for the doctor; but he said, "No. If it has taken me a lifetime to ascertain the nature of plants and animals, is it likely that a four years' curriculum can fit any man to comprehend the mysterious processes of the living human body?"

We sincerely thank Mr. Smiles for this book. Though it lacks the anecdote and adventure so abundant in his *Life of a Scotch Naturalist*, it is free from the prolixity of his later work, the *Life of George Moore*, and is written in his usual easy and pleasant style. There is perhaps too much sameness about Robert Dick's long walks and his enthusiastic admiration for nature, and now and then the author is guilty of repetitions. The account, for instance, of the interview between Sir R. Murchison and Robert Dick in the bakehouse, when with a few handfuls of flour he moulded a geological map of Caithness, is given three or four times. The tone of the book is thoroughly fresh and healthy, though we must hesitate to admit the great gain to geological science through Dick's researches that Mr. Smiles would claim on his behalf. The portrait of Dick, etched by Rajon, is worthy both of the artist and the subject; the landscapes are little gems of engraving, executed with a care and finish seldom bestowed in these days of universal photography on book-plates, and the delicate rendering of light and distance does the engraver much credit.

GAUR.*

THERE are few remains of man's art so impressive as the cities of old time which the forest has covered or the sand has drifted over. The ruinous towns of Yucatan or of the Chaldean plain are not only melancholy but mysterious. History holds no record, and imagination can hardly make a guess, about the causes which wrought the absolute overthrow of so much strength, about the events which ended in such prodigious waste of wealth and labour. The forsaken mosques and palaces of Gaur in Bengal are not, indeed, enigmas of decay, for we know something of the changes of affairs which drove away the rulers and the subjects, the Mussulman and the Hindoo, the saint and his worshippers. The spectacle of vast desolation, half covered by the work of nature, by flowers, palms, and ferns, is still one of the most remarkable that India has to show. In a deep jungle, about eight miles from the English station of Maldah, and on the banks of a stream which joins the Ganges, are the monumental relics of a vanished civilization. The jungle is seamed in every direction by strong embankments and deep trenches, by the fragments of old fortifications, and by roads which are scarcely trodden save by wild beasts. The piles of bridges and of viaducts stand out in the midst of the waste like those which, arrayed on the Roman Campagna, have been compared to lines of mourners following a nation's funeral. Here and there among the tangled branches are fragments of carved marble or of hornblende, which have been torn from their places by the cupidity, and left to moulder unseen by the indolence, of Calcutta tradesmen. The forest is full of lagoons, where the people of the city once drew water, and where the alligator now splashes through the rank grass and weeds. "In the month of December the whole country is golden with a profusion of mustard-blossom, relieved by creepers and wild flowers. As the cold season advances, the scene varies, but is still attractive, for the country abounds in simul, or silk-cotton trees (*Bombax malabaricum*), and in January their leafless branches burst into bloom with brilliant crimson flowers, the glare of which is softened by the delicious green of the tamarind trees. A month later the simul flowers fade, and the pods shed their silky fibre, which, falling on the ground, covers it, as it were, with a coating of snow. Such is Gaur of the present day; a lamentable wreck of its former elegance and grandeur."

What Gaur was seven hundred years ago, and what was its history before it fell into the hands of Muhammadan conquerors (A.D. 1198), is not accurately known. The victors naturally defaced, as well as they might, all remains of Hindoo art. The temples were sacked, the images broken, the peace of the imperturbable gods was shattered with blows of battle-axes and maces. Yet the materials were not wasted, and the Muhammadan invaders were more gentle than the Puritan mobs of England or the Protestant roughs of the Scottish Reformation. The marble facings of the temples were reversed, and carved in the taste of the new masters of Gaur, so that one side of a fallen stone may now show delicate ornamental tracery, while the other preserves the image of some Hindoo deity. The second period of the prosperity of Gaur lasted till about the date of the fall of Constantinople. In quarters of the world far remote, the great towns of races who were unknown to each other, even by report, suffered the same ruin. Gaur, according to the Portuguese historian Faria y Souza, contained twelve hundred thousand inhabitants, and was so crowded that at the season of religious festivals many people were trodden to death in the streets. Yet the streets were "broad and straight," and were lined on both sides with trees to protect men from the heat of the sun. After the rapine and ruin of the Abyssinian dynasty of usurpers (1487) Gaur flourished again under Husain Shah and his descendants (1494-1537). In the latter year it was sacked by the officers of Sher Khan, and in 1575 it was depopulated by the plague. Probably causes like these, which in the instance of Gaur can be historically ascertained, account also for the total decay of the empires that built the cities which perished before history began. On the people, for example, who dwelt luxuriously in the wonderful towns of Yucatan and of Peru a wave of nomad warriors may have swept, like an invasion of Tartars, ruining everything, and passing on in its course. From the general neglect produced by despair a plague would be bred that completed the desolation begun by war, and at last, as in some of the old towns of Italy at this day, a fever-stricken family or two would be left alone in a hut beneath the walls of what was once an imperial capital. Thus since 1575 Gaur has been "the abode only of tigers and beasts of prey," and has only been visited by a few travellers and artists.

This account of Gaur is derived from the papers of the late Mr. Ravenshaw, of the Bengal Civil Service, and from the notes of Mrs. Ravenshaw, Mr. Grote, and Mr. Blochmann. These are published with the very beautiful photographs of the ruins taken by Mr. Ravenshaw, who was for some years magistrate and collector at Maldah. Mr. Blochmann has added to a sumptuous and valuable volume a chapter on the inscriptions of Gaur, examples of which are printed with his translations. It is with the photographs that we are chiefly concerned. The first plate represents the Great Sághar Dighi, "a piece of artificial water nearly one mile long by half a mile broad." The length of this lake, as it may almost be called, runs from north to south, which is taken to be a proof that it is a Hindoo work, and therefore older than the middle of the twelfth century. The remains of some of the six landing-places are still to be traced, but in the photograph we seem to look on a natural mere, fringed with feathery reeds, ferns, and underwood. On the north-west side is a dense bamboo jungle, and a foundation in honour of a saint, Makdum Shah, whose tomb is standing. The trees have almost grown over it, and the branches fleck with a tracery of light and shade the fine low decorative carving of the arches. The mosque built in 1534 by a lady named Jan Jan Miyan is in perhaps better preservation. Here again, as in almost

* *Gaur; its Ruins and Inscriptions.* By the late J. H. Ravenshaw, B.C.S. Edited by his Widow. London: C. Kegan Paul & Co. 1878.

all the remains photographed in this book, the ornament has that elegance which lacks individual character, and is uniform without being monotonous. The general effect produced by these arrangements of conventional patterns never wearies the eye, though it never interests as the carvings of Greek or Gothic or other artists who introduce forms of men and animals interest and allure. The general effect is so invariably pleasing, the colour of the white and blue porcelain tiles and of the other arrangements of colour is so harmonious, the shapes of the airy towers are so graceful, the carpeting, tapestry, and ceiling of natural trees and ferns are so fresh and beautiful, that the taste does not miss the grotesque or graceful forms of Western architecture. In Gaur the Islamite prohibition justifies itself, and though there is scarcely even a conventional representation of anything in heaven, or earth, or the waters under the earth, yet art asserts herself, and attains a standard of perfection.

Something is contributed to the charm of these buildings by the beauty of the inscriptions. Writing was one of the arts; a piece of writing, like a picture, had a loveliness apart from its meaning. The prince of the *Arabian Nights* who, even when transformed into an ape by magic, was the finest writer in the world, might have sketched these inscriptions for the stonecutter. The Greek or the Roman character could never be made like these Arabic characters, an elaborate form of decoration. The letters seem to have been devised that they might be scrolled on the blades of Damascus swords, or inlaid in gold or turquoise, or made to supply the place of representations of plants and beasts on the lintels of temples. One of Mr. Ravenshaw's most interesting photographs is (plate iv.) a picture of the Sadulapúr Ghát. On the sacred steps that lead to the sacred river, and among the broken balustrades and pillars, a crowd of Hindoos are squatting. Half-naked boys stand up to their waists in the water, men and women have spread their carpets on the stairs. Here the local god is worshipped, and here are burned the ashes of the dead. The forest closes round behind, and throws the white staircase into relief. Of the other photographs, that of the "Corridor of the Golden Mosque," with its long perspective of pointed arches, is perhaps the most interesting. The picture of the "Dakhil Gate," with its towers and delicate traceries, also testifies to the ancient importance of the town, which is even better illustrated by the massive Bais Gají wall. As a composition nothing can be finer than (plate xv.) the "East Gate of a Fort." The strong gateway still looks fresh and new, the steps are not overgrown with underwood, the trunks of the palm-trees cast graceful shadows on the roadway and on the battlemented walls. In these scenes (especially in plate xvii.) the modern natives seem to squat or glide in the sunshine like degenerate creatures. They are little better than the lizards that bask among the relics of a greater people. The occasional figure of an Englishman, in his rough shooting-coat and riding-boots, is unmistakably that of a member of a ruling race. He could not be more manifestly the master if he wore the jewelled helmet-crown and chain-armour of the Moslem invaders. To artists the painted mosque (plate xviii.), with its blue, white, green, and yellow tiling, is doubtless the most interesting of the ruins, though perhaps it has suffered most from time, robbers, and the advance of the jungle. The inscriptions, monotonous enough to the general reader (they all contain the same text about the merit of mosque-building), are valuable to the antiquary, and the whole book is a worthy monument of the taste of an English official. Unfortunately the reflection will occur that we, unlike former lords of India, leave no beautiful edifices as marks of our dominion. It will be difficult indeed for a remote posterity to believe that ours was the strongest of the civilizations of India. Our railway cuttings cannot compete with the ancient roads in stability, our tanks are dwarfed by the Sághar Dight, our monuments are perishable if not flimsy. Modern civilization, in fact, "takes short views," has learned that empires are not imperishable, and builds for the day, not for eternity.

EVANS ON THE LAW OF AGENCY.*

TO the non-legal mind it may appear somewhat surprising that the law relating to Principals and Agents should afford material for a work of over five hundred pages such as Mr. Evans's; but the mutual obligations of principal and agent are recognized by the law as subsisting between many persons who are neither principals nor agents in the ordinary acceptation of the terms. Trustees, directors of Companies, masters and servants, ship-captains, brokers, and persons occupying an infinity of other positions are more or less within the scope of Mr. Evans's treatise, as being in some respects amenable to the laws relating to principals and agents. Manifestly, however, the application of general rules to a variety of instances does not afford a satisfactory system of classification, and Mr. Evans has adopted a different method of arrangement. He discusses, first, the contract of agency generally, its origin and dissolution; secondly, the authority conferred, its nature, extent, and execution; and thirdly, the rights, duties, and liabilities arising out of the contract.

It is of little use in dealing with a book of the size of Mr. Evans's to endeavour to follow out the whole plan of the work, and treat separately of every part of it; the more practical method of judging of its merits is to select certain disputed and difficult points, and see how the author disposes of them. We may, however, say generally that the book shows signs of the greatest care and clearness in the arrangement of the matter, and in the selection and statement of the cases. It is no easy task to condense a long reported case so as to incorporate it into a text-book and afford a lucid and concise exposition of the facts, the arguments, and the judgment, with the scope and bearing of the last on previously decided cases. Mr. Evans shows remarkable capacity for this class of work, never overloading his extracts with unnecessary detail, and never omitting important particulars. We have only detected one flaw in his reported cases, and that is at p. 323, where, in relating the case of Bolton *v.* Puller, a mysterious person entitled J. S. appears, who is not otherwise mentioned, and who is presumably identical with the plaintiff, whose initials certainly were not J. S. For the plan of his work Mr. Evans has adopted the method which, in law books at least, ought never to be departed from—namely, of stating a proposition first and proving it afterwards by cases or arguments. There is nothing more bewildering than to have to plod through a series of cases without any very distinct idea what they are all intended to show, information on this point being reserved to the very end of the whole disquisition, on arriving at which it is at once necessary to turn back to the cases in order to see what they really have to do with it. Nothing of this sort offends one's sense of order and fitness in Mr. Evans's book; the development of the subject runs in natural and logical sequence, and the perspicuous and timely statement of the propositions which the cases are adduced to support renders one perusal of the latter sufficient for all practical purposes. Another point which we wish to notice with approval in Mr. Evans's work is that he says what he has to say honestly and fairly in the body of the book, and utilizes footnotes only for the purpose of giving the references to the cases quoted in the text. Some law books which we could mention consist pretty well of equal portions of text and notes, and in one notable instance two concurrent sets of notes are kept going as well as the text. This is slovenly and irritating; one has to keep dodging about from the top of the page to the bottom, a process involving loss of time and temper, and wholly incompatible with a due appreciation of the subject-matter. Mr. Evans has shown that it is possible to construct a law book on more rational principles, and, even if this were its only merit, we should hail his work as introducing a desirable, if a minor, legal reform.

Following out the idea we indicated above, we now proceed to consider how Mr. Evans deals with those abstruse points of the law of agency with respect to which a text-writer is compelled to use his own ingenuity and judgment in reconciling and collating the conflicting or ambiguous dicta of the Courts. The first point of this nature which appears to call for notice is the difficult question of the possibility of ratification by a Company of contracts entered into, ostensibly on its behalf, by its promoters while the Company itself was still *in nubibus*. The obvious and usual rule in such instances is that laid down by Chief Justice Erle in a case quoted by Mr. Evans at p. 57, that "where a contract is signed by one who professes to be signing as agent, but who has no principal existing at the time, and the contract would be wholly inoperative unless binding on the person who signed it, he is bound thereby, and a stranger cannot by a subsequent ratification relieve him from that responsibility." In a subsequent case the same doctrine was applied, even though the preliminary contracts had been referred to in the articles of association of the Company. But, contemporaneously with these cases, the question was being settled the other way in Chancery, on the good old principle which obtained before the Judicature Acts, and but for the passing of those Acts the battle might still be in progress. Mr. Evans does not sum up the result of the contest quite so distinctly as one might expect him to do; perhaps he considers that the standard rule of the new practice, that where law and equity conflict the latter shall prevail, is too well known and of too obvious application in this instance to require comment, or even reference, and contents himself with noticing this settlement of the question when recapitulating the material doctrines respecting ratification to be deduced from the authorities.

When Mr. Evans comes to treat of the implied authority of agents, he has for the first time to go into the peculiar attributes of the persons filling various positions describable as agencies; and the way in which he briefly but sufficiently formulates the quantity and nature of the powers entrusted under ordinary circumstances to such agents as brokers, factors, auctioneers, shipmasters, and solicitors, in pp. 121 to 135, and the manner in which he supports each of his propositions by some standard case, is deserving of the highest commendation. The implied authority of a ship-captain is a peculiarly difficult subject with which to deal, inasmuch as it depends on a great variety of circumstances, and the captain occupies the double position of agent both to the ship-owner and the owners of the cargo; but Mr. Evans has succeeded in concisely and accurately setting forth the whole of the law on the point deducible from the decided cases.

In Book II., part ii., chapter iii., Mr. Evans has to deal with one of the phases of the law of agency which has been the source of much difficulty in the Courts—namely, as to how the fact of agency must be expressed on the face of an instrument in order to exempt the agent signing it from personal liability. Up to a recent date the legal decisions appear to have proceeded strictly on the principle of complicating rather than elucidating the matter. A doctrine was

* *A Treatise upon the Law of Principal and Agent in Contract and Tort.* By William Evans, B.A., Oxon., and of the Inner Temple, Esq., Barrister-at-Law. London: William Maxwell & Son. 1878.

started and sedulously maintained to the effect that mercantile instruments were to be construed on an entirely different basis from ordinary documents; distinctions were drawn between such formulas as "per proc.," "for," and "as agents for"; and in the result directors, agents, and others were held personally responsible upon bills of exchange, promissory and bought and sold notes, couched in forms which to the unbiassed mind suggested nothing but the plainest indications that the person signing acted in legal phrase "as the mere scribe of another." The matter has at last been put on a rational footing by the Court of Appeal within the last two years, that tribunal having decided that the rules of ordinary grammatical construction and interpretation are as applicable to mercantile instruments as to any other class of documents, and that, where a man plainly says he contracts for another, he is not to be taken to mean that he contracts for himself. All this Mr. Evans duly sets forth, following the cases from the chaos of the earlier decisions to the light of the more recent ones, although he does not appear to us to give quite full weight and prominence to the crowning judgment of the Court of Appeal to which we have above referred.

A very interesting portion of the book is that devoted to the disabilities imposed by law on persons filling fiduciary positions, whereby they are practically incapacitated from dealing with or even accepting benefits from those whose interests they are supposed to protect, so long as the fiduciary relation continues. This is the point at which the legal conception of an agent occupies, according to Mr. Evans, its widest range, including trustees, directors, medical men, and many others. So large indeed is the class which Mr. Evans collects under this head that we are disposed to differ with him as to some of the cases he adduces having anything at all to do with the theory of agency. They are rather referable to the equitable doctrine that a man shall not be allowed to retain any benefit which he has acquired by the existence of a relation between himself and the donor from which undue influence on his part may be implied. Directors of a Company may, however, be fairly considered as agents for the Company, and such persons have recently been taught some rather sharp lessons on their duty to their shareholders. But at p. 367 Mr. Evans introduces the subject of innkeepers, apparently for the purpose of stating that such persons have no right to sell the goods of a guest detained as security for his bill; a proposition, by the way, which is no longer law, such power of sale having been given by an Act passed since Mr. Evans's book was written.

The complicated group of enactments commonly known as the Factors' Acts, which regulate the extent to which an agent entrusted with goods, or the documents of title to them, is to be treated as the disposing owner thereof, is carefully expounded by Mr. Evans; but we are bound to notice what looks very like a slip in pp. 428 and 429, where the Act of 1877 is twice analysed in a manner which might engender some confusion in the mind of the reader as to whether it is the same Act that is treated of in both places. The summary, however, of all the Acts and of so much of the Common Law as still remains unaffected thereby is very explicit and useful. The omission of the important word "not" in the first line of p. 464 seriously affects the sense of the case which is there reported, and the following sentence, extracted from p. 472, leaves one somewhat in doubt as to what was the ultimate effect of the decisions:—"The doctrine laid down in Barwick v. English Joint-Stock Bank was subsequently followed by the Court of Queen's Bench, which was reversed on appeal, on the ground that the signature of the manager was not the signature of the Company within 9 Geo. IV. c. 14, s. 6, and adopted by the Privy Council in Mackay v. Commercial Bank of New Brunswick." These, however, are trifling inaccuracies, and cannot materially detract from the standard merit of the book, though it is certainly annoying to have to refer to the reports in order to discover what a text-writer means to say.

We have to speak in high praise of the last portion of the book, which passes in review the cases which have led up to the present very artificial state of the law respecting the liability of employers for the acts or negligence of their servants—first, where such acts or negligence injuriously affect strangers; secondly, where fellow-servants are the victims. Many of the cases seem hardly referable to any definite rule, and the doctrines of common employment and foreseen risks, which laid the foundation of the exemption of masters in many cases of injury to their servants, have been so strained of late years as to call for consideration by a Select Committee with a view to legislation. These cases Mr. Evans has carefully collected and classified, so far as their contradictory nature will permit, thus forming a most useful manual of reference on the subject.

To conclude our notice of this book, we would say that Mr. Evans has chosen an ambitious topic and has certainly not shrunk from following it into its numerous ramifications. If the book fails to be pleasant or easy reading, it is because the author having, as he states in his preface, the idea of a digest before his mind, has confined himself to the baldest possible statement of the law and the cases, indulging in explanation only where it is absolutely necessary, and in comment scarcely ever. Such self-control is rare among legal authors, and if it takes away from the attractiveness of a book, it unquestionably adds to its usefulness, by enabling a large mass of absolutely trustworthy information to be compressed within a small space so as to be readily accessible for use.

MRS. CARDIGAN?*

We fear we shall fail in the attempt to bring before our readers Mrs. Cardigan, the heroine of Mrs. Pender Cudlip's latest novel; for, to tell the truth, we have not fully succeeded in bringing her before ourselves. We will, however, do our best to enable them to picture to themselves that remarkable creature. Her maiden name was Jones—Gladys Jones. She is introduced to the reader as Mrs. Cardigan, a widow; but early in the story she marries Archibald Saltoun, and becomes at once a graceful châtelaine. A châtelaine, as all novel-readers are doubtless aware, is the wife of a man who is the owner of a big country house. Now Mr. Saltoun's house was not only big—it was "great, grand, sombre." She does not remain a châtelaine for any great length of time, for her first husband turns up, and she disappears from the scene till the last chapter of the story. She was a bewitchingly slippery creature—a perfect combination of Cleopatra and the snake. It was owing no doubt to the snake-like part of her character that, when her lover puts his arms round her, she writhes out of his embrace and stands radiant with fury before him. And yet at other times she was magnificently quiescent. Now she bent with loving tenderness and lissome ease over her favourite dog, and now she had a look of sunny ferocity. Her figure was graceful and gloriously rounded. It was pliant and splendidly outlined, and at least on one occasion it was undulating. At times there was in her pose a weary grace that was superbly beautiful and superbly sorrowful. Her head was lovely, well-bred, and beautifully poised; and she had a small, oval, dark-complexioned, winsome, wistful face. So dark indeed was her complexion that her face is described in another passage as being dusky. She was blessed with a voice full of tender inflections, and with a rich store of language whence to draw the words she deemed the aptest for the subjugation of the man who was to be subjugated at the moment. Her store of language was certainly peculiar. We find her, for instance, talking of "the human furniture of the neighbourhood." But we must do the author the justice to admit that she scarcely seems to approve of such language in her heroine. "What a way," she exclaims, "for this unknown, unauthenticated 'creature' to speak about the magnificent stocks that have been firmly and honourably rooted in Somersetshire for generations!" But a few lines further down the heroine falls again into the same style of conversation. "In fact," she says to her future sister-in-law, "you are giving me a preliminary caution to look to my shining." It is a doubtful consolation to the reader who has some little regard for English and some little respect for women to know that when she said this she had "a dozen devils dancing in her eyes." The old schoolmen used, we are told, to discuss how many angels could sit at one time on the point of a needle. The modern female novelist apparently can tell us how many devils can dance at one time in a heroine's eye.

But we must not be led away by such curious investigations, however interesting, from that description of the heroine which we have undertaken to give our readers. When she was going to be married she was bent upon decking her beauty in the most becoming guise that could be devised by the most subtly skilful Parisian taste. When she was married she had diamonds for which a peer might have wept, rubies for which loyal hearts might have bled, and pearls fit to grace the brow of that peerless queen of romance and song, Mary of Scotland. In her new home she soon established a sort of poetic and picturesque ascendency over the minds of the household; and did not, moreover, get on amiss with the honourably-rooted magnificent stocks that were so firmly settled all round her. In her second husband she was most happy, for he was all that a hero should be. His physique was large, grand, generous. He was sunburnt, blue-eyed, stalwart-framed. He was generally admitted to stand at the head of the lot (*sic*) of local potentates by right of his ancient lineage and large possessions. "He's like," said the heroine, this time certainly forgetting to draw, not merely on her rich store of language, but also on her Lindley Murray, "he's like the Prince of Wales would be if he were not the Prince of Wales, but merely an athletic country gentleman." But, in spite of all these blessings, before the end of the second volume this pleasure-loving, wealth-pampered, fierce, fickle, uncontrollable woman is supremely miserable and almost crushed. In marrying her her husband had entered into a union with distress, doubt, and dishonour. Happy would it have been for her had she remained Miss Jones! But she was ambitious. She was, in fact, to quote our author's words, one of those "who are poising themselves in peril and fear on the lowermost round of the ladder." We do not, indeed, pretend to understand how any one who is on the lowest round of a ladder either poises himself or is in peril or fear. But the metaphors used by ladies, more especially when in search of them they go to the trades, are not to be examined too closely. All we mean to say is this, that Miss Jones got into great peril and misfortunes by venturing to mount the social ladder. She did succeed, indeed, in being presented at Court. She had the royal hand given to her with a royal smile, and for a few hours she was simply beaming, balmy, and happy; but her glory was of brief duration, for the same day her presentation was cancelled.

Her fortunes we can follow no longer, for we have not a few great persons on our hands waiting to be described. Among them is H.R.H. the Duke of ———. To such a great personage the

* *Mrs. Cardigan?* A Novel. By Annie Thomas (Mrs. Pender Cudlip). 3 vols. London: Chapman & Hall. 1879.

reader cannot expect to be introduced at once. We shall ushe him into his presence by means of an earl and two countesses. The Earl of Ellerdale was a tall, magnificently-made, heroic-looking man, with the rich golden hair, fair florid complexion, and large, steady, well-opened blue eyes of his race. He was sprung from the Royal White Rose of York, who was as lavish with his lucre as with his love. His stables were full of curveting, historical-looking horses. Once upon a time the heroine herself nearly came into collision with a big gentleman on the burly, historic-looking horse, who swept his hat off in low obeisance, and she thus caught her first sight of the earl. Everything about this great man was magnificent. Most magnificent of all were his family jewels. They were carefully catalogued and fully described on vellum leaves, which were themselves bound in a cover of much worth and magnificence, enriched with precious stones. No wonder that his first wife—his countess, we should say—had an unlimited faith in that magnificent tiger whom she imagined she had tamed. Unhappily for her the heroine had a friend, the brilliant histrionic (*sic*) Miss Gascoigne. A common player might have been called an actress. One who is to marry an earl and become a countess is, no doubt, more properly, if less grammatically, styled "a histrionic." Miss Gascoigne, when on a visit to her friend, is invited to the earl's huge, square, rather rigid white stone mansion in the adjoining parish. The countess falls ill and dies. Whether she was poisoned by "the histrionic" or not the author forgets to tell. She raises our suspicions and then does not return to the subject. We should be inclined to blame her for her carelessness did we not remember that our lady novelists always have such a number of crimes to deal with that a mere case of poisoning may very easily slip the memory. However, the countess dies, and before the "histrionic" a shadow rises that grows more substantial every day, and wears a coronet on its brow and is a woman! She too becomes a Châtelaine—a Châtelaine and a Countess. She is presented at Court to the fairest and sweetest representative that reigning Royalty ever had by an art-loving and æsthetic-minded Duchess, and her sylvan shades are presently honoured by the presence for twenty-four hours of a Prince of the Blood Royal. She spares neither trouble nor expense to do honour to the occasion. In her palatial grounds there are perfect groves of the queen of flowers under glass in bloom all the year round, so that floral trophies were easily raised. The Prince shows the punctuality for which his house is famed. "Being expected, of course (being H.R.H.) he comes." It is she, however, the Châtelaine, and not the Royal Duke, who is the cynosure of all eyes. How she bends and curves herself about, the author observes, in a variety of attitudes expressive of graceful recognition of the plaudits of the multitude! In the dance in the evening the Royal Duke is on the point of "steering" her through the mazes of a waltz, when a servant comes up to say that a person wants to speak to her at once. She sends off the messenger with a stare that is almost a glare, but he returns. It may cost him his place to arrest his mistress in her triumphal progress, but he has received orders which he does not dare to dream of disobeying. He brings a sealed envelope. She tries to laugh, and explains to her Royal partner that it is an apology from some local potentate. The sender of the letter was the villain of the piece, Captain Cardigan, who had married both of the ladies who had subsequently become Châtelaines, and was supposed, by Gladys at least, to be dead. Here the reader has a delightful complication. But this is not enough to satisfy the author. Gladys, finding that her first husband is alive, disappears, and spreads about a report that she is dead. Her second husband, Mr. Saltoun, thereupon marries again, and by a wonderful chance marries Gladys's younger sister, another Miss Jones. It is not till long after his marriage that the relationship between his first and second wife is discovered. When, towards the end of the story, Gladys appears again on the scene the confusion is most bewildering. Both the Miss Joneses had been married to Mr. Saltoun. Captain Cardigan had been married to the elder Miss Jones and also to Miss Gascoigne. Miss Gascoigne was married to the Earl of Ellerdale. Under such circumstances it was not possible for every one to repent and be happy. But the author does the best she can for them all round, and there is as little of what she somewhere calls "lachrymose weeping" as can well be.

Familiar as our author seems to be with grand people and grand houses, we cannot congratulate her on her acquaintance with her own language. The critical reader has doubtless noticed from the extracts we have already given that in her use of words she commonly seems to take that which comes readiest to hand, without much regard to its meaning. We doubt, however, whether she anywhere makes an absurder blunder than in the learned term she applies to the following speech:—"'I'm not selfish in this,' Mrs. Dumorest says to herself, assoiling her own conscience, 'only no one knows better than I do how exceedingly unpleasant it would be for Arch if his wife were at variance with me.'" Mrs. Cudlip calls this an aphorism. From such aphorisms, from such short pithy sentences, may heaven in its mercy deliver us.

KENNEDY'S AGAMEMNON OF ÆSCHYLUS.*

IT was fitting that the two tentative versions of the *Agamemnon* given to the world little more than a year ago by a prominent English poet and a promising classical scholar—the one professing to be a rough yet truthful transcript, the other aiming to unite approximate faithfulness with a large amount of poetic grace, even at the cost of occasional point—should be followed by the publication, on the part of our perhaps most eminent and certainly most experienced Greek scholar, of his own ideal of how this great drama should be translated. Both Mr. Browning and Mr. Morshead can afford to sit at the feet of this veteran scholar and teacher of scholars, to learn, the former how the probable drift of Æschylean iambics or chorus may be reproduced without the necessity of ruggedness or obscurity, the latter how point and force may be preserved with the sacrifice of scarcely an atom of the Greek sense. Dr. Kennedy comes forward not a whit too soon to place in the hands of Greek students a compact but thorough edition of the *Agamemnon*, based on the best editions, commentaries, and lexicons, and supplemented with a translation which he modestly characterizes as "not an attempt to poetize Æschylus in English, but merely to supply students with a close rendering, somewhat more agreeable than a prose version. The dialogue metre is that of the Greek original which in the English is called Alexandrine. The lyric lines do not imitate Greek rhythm, but the antistrophic verses correspond to those in the strophe." Great pains have been bestowed on the text of this edition, and the editor has not disdained to append some half dozen pages of "addenda" in amendment or supplement of earlier notes. As regards the translation, although he does not so much covet the fame of a verse translator as of an interpreter, it will be found, we believe, that through his clear and well-considered treatment of difficulties, his shrewd insight into meaning, his poetic manner and style, he comes little short of the best English translators of the play, amongst whom he would count Miss Anna Swanwick, and we might add Professor Conington. It is worthy of one so eminent in Greek scholarship not to forget a tribute to the recent memory of a friend who, in his Lexicon, did such good service to Æschylus as the late Mr. Linwood; and all will sympathize with his note "in memoriam" of the late Mr. W. G. Clark, the editor of Shakspeare and the brilliant Aristophanic scholar.

That which in truth makes Dr. Kennedy so completely at home in interpreting and rendering Æschylus is the combination in his own person of the ancient and modern learning of these two scholars. This is observable in such criticisms of the Introduction as where he notes that the comparison of the *Agamemnon* of Æschylus with Shakspeare's *Macbeth* will not hold unless we take the *Choephoræ* with the former, because *Macbeth* contains the retribution as well as the crime, while in Æschylus these are distributed between the first two dramas of the Oresteian Trilogy. We must refer to the xivth and xvth pages of the Introduction for Dr. Kennedy's masterly criticism as to where the parallel between the Greek and English dramas holds and fails; as well as for a seeming confusion of Argos with Mycenæ as the scene of the *Agamemnon*. Mr. W. G. Clark justly held that rigorous exactness is quite alien from the spirit of Æschylus, and indeed of all the old poets—a hint that can never be too much borne in mind; but we must beg young students to lay to heart the Professor's remarks as to the kinship in this dramatist between the Furies, as avengers of crime, and the Fates, which plays an important part in the play, and in connexion with which subject the most pregnant word is *ἄτη*. Nowhere, he says, does *ἄτη* mean a crime (*ἁμαρτία*) or wickedness in the abstract (*δυσσέβεια* or *ὕβρις*), but rather the madness attending on crime, the curse consequent on and propagating crime, or the deified avenger of it. A good sample of Dr. Kennedy's version may be cited in a passage illustrative of this—namely, the third antistrophe of the 3rd chorus:—

> From ancient lore among mankind
> Is framed an aged maxim,
> That, grown to fulness, a man's wealth
> Begets, and does not childless die:
> But from good fortune sprouteth
> Woe to the race, unsated.
> But I from others differing
> Am lone in my opinion.
> An impious deed engenders more
> Succeeding, and their stock resembling:
> But righteous families at all times have
> A happy fate in children.
> And Insolence when old is wont to bear
> A youthful Insolence,
> In evil men displayed at this or that time,
> Whene'er the destined season comes.
> The young one genders Arrogance,
> And that uncombated, unwarred,
> Unholy fiend Audacity,
> Black curses both for dwellings, like their parents.

But we must endeavour to give some idea of how far the translator and the critic are combined in Dr. Kennedy in the progress of the play. A famous passage from the First Chorus tells of one of Agamemnon's first sins and temptings of *ἄτη*, the sacrifice of Iphigenia:

> So when the harness of necessity
> He donned, an impious wind-change blowing,
> Impure, unholy, from that moment
> He chose a new all daring purpose.
> For mortals, by its base monitions,
> The wretched madness of first sin emboldens.
> And so he had the hardihood
> To be a daughter's sacrificer,
> Auxiliar to a woman-venging warfare,
> And to the sailing ships
> A rite inaugurating their departure.
> Her prayers and invocations of her sire,

* *The Agamemnon of Æschylus; with a Metrical Translation, and Notes, Critical and Illustrative.* By Benjamin Hall Kennedy, D.D., Regius Professor of Greek, Cambridge, and Canon of Ely. Cambridge University Press. 1878.

Her maiden age, as nought they counted,
Those war-enamoured arbitrators.
And when the litany was ended
The father told the priestly servants,
As lay she prostrate with her robes about her,
With all their heart to lift her high
Prone, as a kid, above the altar,
And watching o'er her lovely mouth to stifle
With voiceless strength of gags
Her shriek of execration on the houses.
But to the earth down-dropping
Her saffron-tinctured veil, each sacrificer
She smote with piteous arrow from her eye,
As though 'twere in a picture, seeming
Desirous to address them; since full often
In the large-tabled guest-hall of her sire
She sang, and virgin with pure voice did honour
Fondly to her fond father's pæan,
That ushered in
With happy fate the third libation.

Our editor here points out that in vv. 203–4 *γυναικοποίνων πολέμων ἀρωγὰν καὶ προτέλεια ναῶν* are in apposition to the clause *θυτὴρ γενέσθαι θυγατρός*; and he goes back to v. 65, *διακναιομένης ἐν προτελείοις κάμακος*, "And snaps the spear in the onsets," for illustration of the sense of *προτέλεια*, which, meaning primarily "prenuptial sacrifices," comes to signify metaphorically, at one time, a skirmish before a battle, at another a sacrifice before a voyage. At vv. 211–12, *στόματός τε καλλιπρῴρου φυλακὰν κατασχεῖν κ.τ.λ.*, Dr. Kennedy observes that *φυλακᾷ* for *φυλακὰν* would render the construction simple; but this, as every scholar knows, is a *primâ facie* argument that it would not therefore make it more like Æschylus. For the same reason we should doubt Mr. Paley's solution making *φυλακὰν* the subject of *κατασχεῖν*, "that a watch should restrain." Better is it to adopt the sense and construction which Dr. Kennedy has preferred, and take *φυλακὰν* for a contained accusative depending on *κατασχεῖν*, which also governs *φθόγγον* as the object.

Another difficult passage, which Dr. Kennedy himself only attempts to correct according to the requirements of the sense, without seeking to divine the lost words of the original, is where, in the second chorus and second strophe, occur lines which different interpreters have held to apply—some to Helen, others to Menelaus; and as to which Dr. Kennedy shows, we think, strong cause for attributing them to the latter. It is where the results of the elopement of Paris are pictured:—

ἰὼ ἰὼ δῶμα, δῶμα καὶ πρόμοι,
ἰὼ λέχος καὶ στίβοι φιλάνορες.
πάρεστι σῖγ' ἄτιμος ὡς ἀλοίδορος δ'
ἄδιστ' ἀφαιρεθεὶς ἰδεῖν.

It is not so certain to our apprehension as to Dr. Kennedy's that Helen cannot be the subject here; though we have to record Miss Swanwick's and Mr. Morshead's versions as in favour of his view, while Mr. Browning clings to what is perhaps the more poetic interpretation:—

There she stands silent! meets no honour—no
Shame—sweetest still to see of things gone long ago.

One assuredly happy thought of the Regius Professor is to reject *ἰδεῖν*, which has no necessary connexion with the sense as a gloss; and then, for *ἄδιστ' ἀφαιρεθεὶς . . . .* to read *ἄδιστ' ὅσ' ἦν ἀφειμένος*, "after parting with all that was sweetest." The sense will then be:—

O palace, palace, and ye chiefs!
Alas! O bed and all ye traces
Of husband loving kindness!
Silent as one disgraced, but unupbraiding,
He stands to view, bereft of all that's sweetest.

There is no denying that the sequel or context makes for Dr. Kennedy's solution.

It is time, however, to turn to two or three passages we have noted as indicative of Professor Kennedy's critical acumen, a quality without which no poetic gift will enable a translator to do justice to his original. In the famous speech of Clytemnestra describing the succession of beacons conveying the courier fire to Argos, the fourth stage is from Mount Athos to Mount Makistus in Eubœa. The MS. reading is

ὑπερτελής τε πόντον ὥστε νωτίσαι
ἰσχὺς πορευτοῦ λαμπάδος πρὸς ἡδονὴν
πεύκη τὸ χρυσοφεγγές, ὥς τις ἥλιος
σέλας παραγγείλασα Μακίστου σκοπαῖς.

Here Dr. Kennedy suggests in the third verse the very probable *προὔκειτο* as a manifest and plausible improvement. The passage, as it stood, lacks a finite verb, and is cumbered by a superfluous noun. Instead of the latter, Dr. Kennedy hits upon *προυκεῖτο*, to elucidate the sense, and to be strengthened by the adverbial phrase *πρὸς ἡδονήν*. These two words may be only a neutral rendering of the suggested verb, or they may be coupled with *Μακίστου σκοπαῖς*, and mean in either case "at its own sweet will," or "to the delight of beholders," especially the watchers of Makistus. Anyhow, a transparent sense is lent to the whole four lines in the interpretation, "High reaching, so as to skim the sea, the strength of the travelling torch lay forth to full delight, and transmitted, like some sun, a blaze of golden light to the watchmen of Makistus."

In a remarkable line of a chorus from which we have already quoted, the MS. reading is

ἐκ θεοῦ δ' ἱερεύς τις ἄτας δόμοις προσεθρέφθη (681),

and our editor here expresses his conviction on metrical grounds that Æschylus never wrote *ἐκ θεοῦ*, and suggests that he might not improbably have written *θείας ὧδε θεία ἄτα*, which would be as Æschylean as *θεῖον ψύθος* in 488. Further on, in v. 861, Agamemnon's speech to Clytemnestra ends with the line

εἰ πάντα δ' ὡς πράσσοιμεν εὐθαρσὴς ἐγώ.
If thus in all things I shall fare, my cheer is strong.

Dr. Kennedy dissents, apparently with reason, from Mr. Paley's unnecessary taking of *πράσσοιμι* in the sense of "acting." As he rightly argues, such a feeling of confidence would be more telling in its dramatic effect at a moment when Agamemnon's death was immediately to ensue. In numberless places in this part of the drama the language of the interlocutors is ambiguous, ominous, and secretly illustrative of the covert irony of fate.

But it is needless to multiply proofs of the value of this volume alike to the poetical translator, the critical scholar, and the ethical student. We must be contented to thank Professor Kennedy for his admirable execution of a great undertaking and to await his appearance in fresh fields of ancient literature and criticism.

MINOR NOTICES.

MR. ELLACOMBE, under a double enthusiasm for Shakspeare and for his garden, has produced a very readable and graceful volume on the Plant-Lore of Shakspeare (1), in which a dictionary of every plant or tree named in the plays and poems is illustrated by the passages in which it occurs, with literary, botanical, and gardening illustrations. In turning over the leaves it is impossible not to be struck with the poverty of the Elizabethan garden, compared with the riches at the disposal of the modern horticulturist, and at the same time with the reflection that in the hands of a gardener of genius even the repertory of that time gave infinite material for his art. The "upright" cedar of the dramatist was the creation of imaginative forecast, as that horizontal-growing tree was not introduced into England until 1676, and was actually a stranger when Evelyn first published the "Sylva." On the other hand, that supplanter of native roots and greens, the potato, had reached this country just in time to be commemorated by Shakspeare. Mr. Ellacombe, like some other critics, makes much unnecessary difficulty over Shallow's pippin "with a dish of caraways," which he believes to be "the apples so named," and not, like "many of the commentators," either a dish of caraway seeds, "or cakes flavoured with caraway seeds." The fact is that a pippin with a dish of caraways means a pippin with a dish of caraways—the pippin, however, being roasted. This comestible is still a traditionary luxury in the Combination Room of Trinity College, Cambridge. Formerly it was served up on every "Feast day," and it still makes its appearance upon the annual audit day, when every guest has set before him a roasted apple, with a portion of caraway seeds in another saucer. No doubt the caraway apple was so named because it was a favourite sort for roasting.

Dr. Wild's handsome and entertaining volume (2) grew out of what was intended at first merely as a record of personal impressions for the use of relatives and friends. Books produced in this manner are generally apt to give rise to a wish that the impressions had been kept for the use of relatives and friends; but, if this is a rule, Dr. Wild's work is a very distinct exception to it. There is scarcely a dull line in the volume; and the author's skill in description enables one, with the exercise of a very little imagination, to visit all the curious places and see all the interesting sights of which he tells us. The vividness of the letterpress is helped by the author's extremely clear and accurate etchings. For the lithographed coloured illustrations we cannot find much praise; but that scarcely detracts from the merit of the work, which has a greater value than that which will perhaps make it most popular—of being exactly the kind of book to lie on a country-house table.

Mr. Pritchett has produced, under the appropriate title of *Gamle Norge* (3), an interesting and amusing account of some weeks which he spent in "that grand, yet simple country, Norway." He travelled in what we conceive to be the right spirit of a traveller, determined to observe men and manners, and to regard no detail as beneath notice. The result of his observations is a narrative which runs pleasantly on, gives one a good idea of what the author saw, and yet avoids the danger of dealing in tiresome trivialities. Archæologists will find special interest in the chapter on Bergen. Many of the illustrations have considerable merit. The only possible objection that could be made to the book is that it may tend to increase the stream of tourists who threaten to make Norway as vulgar as Switzerland.

The present volume (4)—apparently the third, though there is

---

(1) *The Plant-Lore and Garden-Craft of Shakespeare.* By Rev. Henry N. Ellacombe, M.A. For the Author, by William Pollard. Exeter.

(2) *At Anchor: a Narrative of Experiences Afloat and Ashore during the Voyage of H.M.S. "Challenger" from 1872 to 1876.* By John James Wild, Ph.D., Author of "Thalassa." With Illustrations by the Author. London: Marcus Ward & Co.

(3) *Gamle Norge: Rambles and Scrambles in Norway.* By Robert Taylor Pritchett. With more than One Hundred and Twenty Illustrations. London: Virtue & Co.

(4) *Cassell's Library of English Literature.—English Plays.* Selected, Edited, and Arranged by Henry Morley, Professor of English Literature at University College, London. With Illustrations. London, Paris, and New York: Cassell, Petter, & Galpin.

no indication of that on the title-page—of Messrs. Cassell's *Library of English Literature*, is devoted to plays, the editing and arrangement of which has been entrusted to Mr. Henry Morley. The volume opens with plays earlier than *Ralph Roister Doister* and *Gorboduc* and comes down to Mr. Tennyson's *Harold*, which Mr. Morley describes, somewhat rashly, as being "actable whenever the time shall come, as it will come, when Englishmen again are asked to wear their best minds in the theatre." In the opening of his work Mr. Morley gives an excellent definition, as concise as may be, of what a play is. It is "the story of one human action, shown throughout by imagined words and deeds of the persons concerned in it, artfully developing a problem in human life, and ingeniously solving it after having excited strong natural interest and curiosity as to the manner of solution. It must not be too long to be presented to spectators at a single sitting." The writer goes on to point out, with perfect justice, that a work falling short in any of these requirements is either no play at all or a bad play, and to say that a play must be a story of action, not a recital of thought in the form of dialogue. Then, expanding his first definition, which might seem to exclude all idea of underplot, he remarks that "when two stories are interwoven, they must be necessary to each other, and so blended as to become one to the understanding." Mr. Morley goes on to give a short sketch of the gradual development of the drama up to the time of the Mysteries, from one of which, the *Shepherd's Play* in the "Wakefield Mysteries," he gives, with appropriate notes, a long extract, the first lines of which it may be not uninteresting to quote:—

PRIMUS PASTOR.

Lord, what these weathers are cold, and I am ill happid;
I am near hand and old, so long have I nappid;
My legs they fold, my fingers are chappid,
It is not as I would, for I am all lappid
In sorrow.
In storms and tempést
Now in the east, now in the west,
Woe is him has ne'er rest
Mid day nor morrow.
But we silly shepherds that walks on the moor,
In faith we are near hands out of the door;
No wonder as it stands if we be poor,
For the tilth of our land lies fallow as the floor,
As ye ken.
We are so hamid
For-taxid and ramid,
We are made hand-tamid
With these gentlery men.

From this it would appear that the complaints of agricultural labourers are of very old standing. Shortly after this play we come upon the well-known *Ralph Roister Doister* and *Gorboduc*, and the possibly less well-known *Cambyses*, by Thomas Preston, which is supposed to have been acted as early as 1561, and to be referred to in the words uttered by Falstaff in *Henry IV.* Part I.:—"Give me a cup of sack to make mine eyes look red, that it might be thought I have wept; for I must speak in passion, and I will do it in King Cambyses' vein." The printed black-letter copy of the play is curious as showing that every actor took several parts—one man playing, amongst other things, Lord Smirdis, Ruff, and Venus. Later on Mr. Morley gives us an extract from Sir Philip Sidney, which contains the remarkable passage which shows that the quarrel between the classical and romantic schools was very far from being new when *Hernani* was first produced:—"But besides these gross absurdities, how all their plays be neither right tragedies nor right comedies, mingling kings and clowns, not because the matter so carrieth it, but thrust in the clown by head and shoulders to play a part in majestical matters, with neither decency nor discretion; so as neither the admiration and commiseration, nor the right sportfulness is by their mongrel tragi-comedy obtained. I know Apuleius did somewhat so, but that is a thing recounted with space of time, not represented in one moment; and I know the ancients have one or two examples of tragi-comedies as Plautus hath Amphytrio. But, if we mark them well, we shall find that they never, or very daintily, match hornpipes and funerals." Sir Philip Sidney pinned his faith on Aristotle's canons as devoutly as did the critics of the eighteenth century, and he would doubtless have thought Garrick right in presenting *Hamlet* with the grave-diggers cut out. Another passion, or fashion, of the eighteenth century, that for the German school of drama which Canning ridiculed in *The Rovers*, is most justly condemned by Mr. Morley, the only part of whose work which we do not like is found in his last page. We have quoted what he there says about *Harold;* and his remarks upon *Queen Mary* seem to us even more needless and injudicious. Furthermore, he seems to think that Mr. Browning's *Return of the Druses* is a good acting play. All this is strangely at variance with the knowledge which he displays in his prefatory words of what a good play should be; but it does not materially injure a work which can be safely recommended to all who take an interest in the subject.

The Oxford University Press has issued a very handsome Bible (5), containing notes, a Biblical index, a concordance, a dictionary of Scripture proper names, maps, and a compendium of Scripture natural history. The list of "words obsolete or ambiguous" contains a great many which we are much surprised to find there. "Abjects," "bewray," "cleave," "bosses," and many other words which are so set down are surely neither obsolete nor ambiguous. We see no kind of use in including them under these titles, nor are we satisfied with the derivations appended to some of the words. For the general arrangement, printing, and binding of the volume we have nothing but praise.

We find the same fault and the same merits repeated in the volume of *Helps to the Study of the Bible* (6), which is issued also by the Oxford Press.

Mr. Pascoe, in a preface to the exceedingly useful volume (7) which he has compiled, observes that, "in point of fact, the volume does not assume to be complete," but that in future editions he hopes to be able to remedy its present deficiencies. It will be well that this should be done, although it is impossible not to accept the excuses which the compiler makes for his few shortcomings. One or two of them strike us as odd; for instance, there is no mention in the book of Mr. G. W. Anson, and under Mr. Arthur Cecil's name we find not a word about his marvellous performance of Tourbillon; but, on the whole, the work is excellently done, and will in its perfected shape be of the greatest value as a book of reference.

Dr. Leo, in a preface to the singularly interesting volume (8) which he has brought out, gives a courteous, if needless, explanation of his motive in taking afresh some of the ground which Mr. Skeat occupied in his *Shakespeare's Plutarch*. To the value of Mr. Skeat's work Dr. Leo gives full recognition; but points out that his reprint was not absolutely free from typographical errors—an assertion which Mr. Skeat very oddly spoke of in print as "wholly unfair and ungenerous"—and that in Mr. Skeat's production the post-Shakspearian editions of North are collated, which for Dr. Leo's purpose is clearly needless. The chief merits of Dr. Leo's edition are its absolute correctness as a reproduction, and the fact that, "as a means to facilitate the finding out of lines in Plutarch, there is added an indicator of lines, printed on diaphanous cloth, which it is only necessary to place in the fold of the book between two leaves, so that the line marked I covers the first line of the page. The indicator gives you the number of lines without covering the print or interfering with the reading." Dr. Leo's labour has evidently been one of love, and his work will be valued by all who are interested in the study of Shakspeare.

We have before us *Dod's Parliamentary Companion* (9), for 1879, a work which it has long since become unnecessary to praise, and towards the improvement and perfection of which no pains have been spared by the editor.

We confess to a certain dislike of the affectation of old-fashioned printing which modern "æstheticism" has encouraged; but we must admit that the practice is seen at its best in the volume on Flower Lore (10) produced at Belfast, which treats in a pleasant spirit of love for flowers, of their "teachings, historical, legendary, poetical, and symbolical." The book is one which will be prized both by flower-lovers and by book-collectors.

It is tolerably certain that no amount of written advice and information as to the performance of physical feats can in any way make up for the want of practical instruction, and this rule applies as much to "Captain Crawley's" handbooks (11) on various physical arts as it does to all other handbooks on similar subjects—past, present, and to come.

Miss Butt's story, which appears in the pleasant *Blue Bell Series* (12), is a pretty, if somewhat dolorous, little love tale.

Mrs. Chetwynd's prettily-written little story (13) is exceedingly moral, but manages to be completely inoffensive, and is certain to be liked by children.

A new edition has appeared of one of the most delightful books ever written, Waterton's *Wanderings* (14). No better editor could be found for such a work than Mr. Wood, whose own work on natural history is well known. The biography is exceedingly interesting; and the editing of the whole book is excellent. A special word of praise is due to the illustrations.

Messrs. Chapman and Hall open a new and promising series of scientific literature with a translation of M. Véron's work on

(5) *The Holy Bible; containing the Old and New Testaments.* Oxford: Printed at the University Press. London: Henry Froude.

(6) *Helps to the Study of the Bible; containing Analytical Notes and Summaries of the several Books, Historical, Chronological, and Geographical Tables, &c.* Oxford: Printed at the University Press. London: Henry Frowde.

(7) *The Dramatic List: a Record of the Principal Performances of Living Actors and Actresses of the British Stage, with Criticisms from Contemporary Journals.* Compiled and Edited by Charles Eyre Pascoe. London: Hardwicke & Bogue. Boston, U.S.: Roberts Brothers.

(8) *Four Chapters of North's Plutarch.* Containing the Lives of Caius Marcius Coriolanus, Julius Cæsar, Marcus Antonius, and Marcus Brutus, as Sources for Shakespeare's Tragedies, "Coriolanus," "Julius Cæsar," "Antony and Cleopatra," and partly to "Hamlet" and "Timon of Athens." Edited by F. A. Leo. London: Trübner & Co. Strassburg: Karl Trübner.

(9) *Dod's Parliamentary Companion.* Forty-seventh Year. London: Whittaker & Co.

(10) *Flower Lore.* Belfast: McCaw, Stevenson, & Orr. London: Bell & Sons.

(11) *Captain Crawley's Handbooks.—Rowing, Sculling, and Canoeing.* By a Member of the London Rowing Club. *Sailing and Yachting.* By a Member of the Thames Yacht Club. London: Ward, Lock, & Co.

(12) *The Blue Bell Series. A Sprig of Heather.* By Geraldine Butt. London and Belfast: Marcus Ward & Co.

(13) *The Crystal Heart, and its Lights and Shadows: a Little New Year's Story for Children.* By the Hon. Mrs. Henry Chetwynd. Edinburgh and London: Blackwood.

(14) *Wanderings in South America.* By Charles Waterton. New edition. Edited, with Biographical Introduction and Explanatory Index, by the Rev. J. G. Wood. London: Macmillan.

Æsthetics (15), which was reviewed at length in these columns in the original.

We have before us the sixteenth edition of that most useful work, the *Dictionary of Dates* (16), edited with all the care that we are accustomed to find in Mr. Vincent's work.

From Messrs. Marcus Ward and Co. we have received some most excellent specimens of Pocket Diaries, which are arranged so that when the record of onequarter is done with, it can be displaced to make room for that of the next—a method which, of course, makes the diary itself more portable than is usual.

Mr. Wyld sends us some opportune and serviceable maps of Central Asia and Afghanistan, accompanied by an excellent little volume of notes.

(15) *The Library of Contemporary Science.—Æsthetics.* By Eugène L. Véron. Translated by W. H. Armstrong. London: Chapman & Hall.

(16) *Haydn's Dictionary of Dates.* Sixteenth Edition. Containing the History of the World to the Autumn of 1878. By Benjamin Vincent, Librarian of the Royal Institution of Great Britain.

Every other description of Banking Business and Money Agency, British and Indian, transacted.
J. THOMSON, *Chairman.*

HIGH WYCOMBE GRAMMAR SCHOOL.—
The Governors of this School will proceed to an Appointment of a HEAD-MASTER on the 6th of March next.
No person will be disqualified from being appointed Head-Master by reason of his not being in Holy Orders, but he must be a Graduate of some University in the United Kingdom.
The Head-Master will hold his office subject to the provisions of the Scheme for the Governance of the School recently settled under the Endowed Schools Acts. Copies of the Scheme can be obtained on application to me at the price of 2s. 6d. each copy.
The School is a Day and Boarding-School for Boys between the ages of Seven and Seventeen.
The Head-Master will receive a Fixed Stipend of £150 per annum, and a Capitation Fee of £1 10s. per annum for each boy not exceeding twelve years of age, and £2 10s. per annum for each boy exceeding that age, and he will be allowed to take an approved number of Boarders, the payment for each Boarder, apart from the Tuition Fee, not exceeding £10 per annum, will be hereafter fixed by the Governors.
A Residence will be provided for the Head-Master.
It is proposed when funds permit to restore the present school and erect a new Head-Mast[illegible] In the [illegible] the School and for [illegible]
[illegible] ling t[illegible]
be sent to me not later than February 20, 1879.
The Head-Master will be required to enter upon his duties on March 25, 1879.
It is requested that no personal application be made to any Governor.
JOHN PARKER, Junior, *Clerk to the Governors.*
High Wycombe, January 1879.

CLERGY COOPERATIVE ASSOCIATION, LIMITED.—
The Directors propose to appoint Gentlemen of experience and position, not more than Forty-five years of age, to fill the offices of SECRETARY, and of ACCOUNTANT, and STATISTICIAN, at a Salary for the former commencing at £200 a year, and for the latter, commencing at £300 a year.
Written applications only (to be marked outside "Secretary" or "Accountant") may be sent to the Secretary (pro tem.), at the office, 85 Long Acre, up to Friday, January 17th, giving full particulars of [illegible] and of qualifications for the post [illegible] copies of testimonials.
By Order.
WILLIAM H. ALLEN, *Secretary pro tem.*

HYDROPATHY.—SUDBROOK PARK, Richmond Hill.
Physician—Dr. EDWARD LANE, M.A., M.D. Edin. A health resort for Invalids and others. Turkish Baths on the Premises. Private entrance to Richmond Park. Prospectus on application.

OVERLAND ROUTE and SUEZ CANAL.—
Under Contract for the conveyance of the Mails to the Mediterranean, India, China, Japan, and Australia. The Peninsular and Oriental Steam Navigation Company despatch their Steamers from Southampton, *via* the Suez Canal, every Thursday, from Venice every Friday, and from Brindisi, with the Overland Mails, every Monday.
Offices, 122 Leadenhall Street, E.C., and 25 Cockspur Street, S.W.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel.
P. O. RICKARDS, *Manager.*

BATH.—HOT MINERAL WATERS and unequalled BATHS, efficacious in RHEUMATISM and GOUT. Literary, artistic, and general Society. The Victoria Park, Theatre, and Public Rooms are constantly open. Great Educational advantages. Excellent shops and market.—For information apply to Mr. W. H. SIMMS, 31 Gay Street, Bath.

THE ASTRONOMER-ROYAL Reported to the Admiralty (August 1, 1870) on 40 Chronometers entered for annual competition, "M. F. DENT'S is the finest we have ever had on trial." The Report on Chronometers, Watches, &c. by the Judges at the Philadelphia Exhibition can be had on application.—M. F. DENT, Chronometer, Watch, and Clock Maker to the Queen, 33 COCKSPUR STREET, CHARING CROSS.

FURNISH YOUR HOUSE or APARTMENTS THROUGHOUT on MOEDER'S HIRE SYSTEM. The original, best, and most liberal. Cash Prices; no Extra Charge for time given. Large, useful Stock to select from. Illustrated priced Catalogue, with Terms, post free.—248, 249, and 250 Tottenham Court Road, and 19, 20, and 21 Cross Street, W.C. Established 1862.

GOLD MEDAL PALMITINE CANDLES of PRICE'S PATENT CANDLE COMPANY, Limited.—The Company recommend these and their BEST COMPOSITE CANDLES, their NEW PATENT NIGHT LIGHTS for burning in a glass without the paper case, their CHILD'S NIGHT LIGHTS, and their PURE GLYCERINE. GOLD MEDAL again awarded to the Company in the PARIS EXHIBITION of 1878.

"I ALWAYS USE IT MYSELF and recommend it to my patients, as being more free from excess of alkali and other impurities prejudicial to the skin," wrote the late eminent Surgeon,
Mr. JAMES STARTIN, of
PEARS' TRANSPARENT SOAP.
To be had of Chemists and Perfumers everywhere.

WILLS'
"WESTWARD HO!"
WILLS' "WESTWARD HO!" NEW SMOKING MIXTURE.
"When all things were made, none was made better than Tobacco; to be a lone man's Companion, a bachelor's Friend, a hungry man's Food, a sad man's Cordial, a wakeful man's Sleep, and a chilly man's Fire. There's no Herb like it under the canopy of heaven."—*Kingsley's "Westward Ho!"* In 1 oz., 2 oz. & 4 oz. packets, lined with tinfoil.
[WIL]LS, W. D. & H. O.

LAZENBY & SON'S PICKLES, SAUCES, and CONDIMENTS.—E. LAZENBY & SON, Sole Proprietors of the celebrated Receipts, and [manufac]turers of the Pickles, Sauces, and Condiments, so long and favourably distinguished [by thei]r Name, beg to remind the Public that every article prepared by them is guaranteed [entir]ely Unadulterated.—92 Wigmore Street, Cavendish Square (late 6 Edwards Street, [Portm]an Square), and 18 Trinity Street, London, S.E.

HARVEY'S SAUCE.—Caution.—The Admirers of this celebrated Sauce are particularly requested to observe that each Bottle, prepared by E. LAZENBY & SON, bears the Label used so many years, signed "*Elizabeth Lazenby.*"

IN CONSEQUENCE OF SPURIOUS IMITATIONS OF
LEA & PERRINS' SAUCE,
which are calculated to deceive the Public, LEA & PERRINS have adopted a NEW LABEL, bearing their Signature, "LEA & PERRINS," which Signature is placed on every Bottle of WORCESTERSHIRE SAUCE, and without which none is Genuine. Sold Wholesale by the Proprietors, Worcester; Crosse & Blackwell, London; and Export Oilmen generally. Retail, by Dealers in Sauces throughout the World.

EPPS'S COCOA.	GRATEFUL AND COMFORTING.
	JAMES EPPS & CO. HOMŒOPATHIC CHEMISTS.

GOLD MEDAL, PARIS.
"THE fresh and splendid distinction of a Gold Medal, now given in 1878."—Paris Correspondent of the *Daily Telegraph.*
FRY'S COCOA EXTRACT.
Guaranteed pure Cocoa only, deprived of the superfluous oil. Sold in Packets and Tins.

THROAT IRRITATION.
EPPS'S GLYCERINE JUJUBES.
Soreness and dryness, tickling and irritation, inducing Cough and affecting the Voice. Sold only in Boxes, 6d. and 1s. labelled thus: "JAMES EPPS & CO., Homœopathic Chemists, 48 Threadneedle Street and 170 Piccadilly."

INDIGESTION.—MORSON'S PREPARATIONS of PEPSINE. See Name on label. Highly recommended by the Medical Profession. Sold in Bottles as WINE, at 3s., 5s., and 9s.; LOZENGES, 2s. 6d. and 4s. 6d.; GLOBULES, 2s., 3s. 6d., and 6s. 6d.; and POWDER, in 1 oz. Bottles, at 4s. each.—By all Chemists, and the Manufacturers, T. MORSON & SON, Southampton Row, Russell Square, London.

CROWE'S GOUT and RHEUMATIC PILLS (Prepared from the Recipe of an Eminent Scotch Physician) perfectly cure Gout, Rheumatism, Rheumatic Gout, Pains in the Joints, Lumbago, Sciatica, and all Gouty, Neuralgic, and Rheumatic Pains. Sold in Boxes at 1s. 1½d.; post free, 14 stamps; by THOMAS CROWE, Practical Chemist, 40 Princes Street, Leicester Square, London; of all Chemists; and in India by Messrs. OAKES & Co., Merchants, Madras.

BOOKS, &c.

MUDIE'S SELECT LIBRARY.—NEW BOOKS.—NOTICE.
One Thousand Copies of Fanny Kemble's Records of a Girlhood, One Thousand Copies of Smiles's Life of Robert Dick of Thurso, Two Thousand Five Hundred Copies of Mrs. Brassey's Voyage of the *Sunbeam,* and very many Copies of every other recent Work of general interest are in circulation at MUDIE'S SELECT LIBRARY. Fresh Copies are added as the demand increases, and an ample supply is provided of all the principal Forthcoming Books as they appear. First-class Subscription, One Guinea per annum and upwards, according to the number of volumes required. Prospectuses postage free on application.

MUDIE'S SELECT LIBRARY.—CHEAP BOOKS.—
See MUDIE'S CLEARANCE CATALOGUE. New Edition now ready. This Catalogue contains The Life of the Prince Consort; Through the Dark Continent, by H. M. Stanley; A Voyage to Polar Seas, by Sir G. S. Nares; Senior's Conversations with Thiers and Guizot; Thomson's Voyage of the *Challenger*; Philochristus; Life of Canon Kingsley (best Edition); Captain Burnaby's Two Rides, and more than Three Thousand other Popular Works in History, Biography, Religion, Philosophy, Travel and Adventure, and the Higher Class of Fiction, at the lowest current prices, and is especially commended to the attention of Librarians and Secretaries of Public Institutions, and other large purchasers of modern Books.

MUDIE'S SELECT LIBRARY.—NOTICE.—All the Books in Circulation or on Sale at MUDIE'S SELECT LIBRARY may also be obtained, with the least possible delay, by all Subscribers to MUDIE'S MANCHESTER LIBRARY, BARTON ARCADE, MANCHESTER (one Minute's Walk from the Exchange).
Mudie's Select Library, Limited, New Oxford Street. City Office, 2 King Street, Cheapside.

THE SATURDAY REVIEW.—The following NUMBERS of THE SATURDAY REVIEW are required, for which 6d. each will be given, viz.: 10, 74, 75, 76, 81, 88, 91, 192, 669, 771, and 949 (clean copies)—at the Office, 38 Southampton Street, Strand, W.C.

AMERICAN NEWSPAPERS, MAGAZINES, and PERIODICALS.—DESCRIPTIVE LIST of over 700 Publications, with subscription prices in sterling, just published. Sent free on application by the WILLMER & ROGERS NEWS COMPANY, 11 Bouverie Street, Fleet Street, London.

BOOKS, at a discount of 3d. to 9d. in the Shilling, or 25 to 75 per cent.—GILBERT & FIELD have just issued their CATALOGUE of BOOKS, from the published prices of which they allow the above liberal discount. Catalogues gratis and postage free on application.
GILBERT & FIELD, 67 Moorgate Street, London. E.C.

Now ready, royal 8vo. 1,650 pp. cloth gilt, 38s.
SIR BERNARD BURKE'S PEERAGE, BARONETAGE, KNIGHTAGE, &c., for 1879.
"A drawing-room is inadequately furnished without it, and the student's library incomplete unless the book is on the shelf. To official and legal men, and indeed to the public at large, the information it contains is indispensable. It is more suitable and more acceptable as a Christmas present than any annual publication we know."
Illustrated News, December 28, 1878.

POLITICS, LITERATURE, SCIENCE, AND ART.

No. 1,212, Vol. 47. January 18, 1879. [Registered for Transmission abroad.] Price 6d.

EXECUTION OF THE TREATY OF BERLIN.

ALTHOUGH accuracy of statement and justness of prediction are not Lord BEACONSFIELD'S most characteristic accomplishments, many assailants have been disappointed by the fulfilment of the prophecies or announcements which he lately made at the Guildhall and in the House of Lords. In answer to the exulting assertion that the Treaty of Berlin had already proved abortive, Lord BEACONSFIELD declared that all parties were prepared to discharge their liabilities, and that his Government would insist on strict compliance with the terms of the arrangement. It may be admitted that, in the later summer and autumn, the language and conduct of Russian civil and military officers furnished some ground for alarm. The Governor of Bulgaria, especially, threatened without disguise the annexation of Eastern Roumelia, and publicly denounced the treaty by which he ought to have regulated his conduct as impracticable and absurd. At the same time the Russian newspapers were allowed to represent the establishment of the Mission at Cabul as a deliberate contrivance for the purpose of extorting from England concessions in Europe. Liberal orators might be excused for believing that the Government had received a serious check, although only factious blindness could account for the satisfaction which they expressed in the humiliation which seemed to have been imposed on the country. The Government was better informed, and during two or three years it has learned by repeated experience the safest mode of dealing with Russian menaces and encroachments. A firm refusal either to modify the Berlin Treaty or to allow European questions to be mixed up with Indian complications resulted in the final determination of the Emperor ALEXANDER to execute a treaty by which he had obtained great advantages. It was at the same time necessary to obtain the practical completion by the Turkish Government of sacrifices in which it had been already forced to acquiesce. The English AMBASSADOR had fortunately, by his untiring energy and transparent loyalty, acquired great and well-deserved influence at Constantinople; and, in spite of domestic and foreign intrigues, his advice has in all important cases been ultimately followed. The French MINISTER for FOREIGN AFFAIRS took the most active part in urging on the Porte the unpalatable rectification of the Greek frontier which he had caused to be inserted, though not in an obligatory form, in the treaty. There is now reason to believe that peace will be effectually secured by the common action of the principals in the war, and of the dependents of Russia and the clients of France.

Although it is said that the Russian Governor of Bulgaria was received on his late visit to the EMPEROR with extraordinary honours, it is evident that peremptory orders were given to him which may probably not have coincided with his previous instructions. When he threatened and blustered and promoted insurrections against the Turkish Government, he may perhaps have been acting as an obedient servant of his sovereign. He has since shown himself capable of carrying out a policy which may be less congenial with his own feelings. The International Commission which is charged with the organization of East Roumelia [illegible] meets with opposition from Russian officers; the Macedonian insurrection has collapsed in the absence of foreign aid, and the Governor seems to confine his activity to the province which it regularly entrusted to his charge. The negotiations at Constantinople have proceeded more smoothly, and it is hoped that the definitive treaty may be signed in a few days. The new Turkish Ministers have at last issued peremptory orders for the evacuation of the Albanian districts which are to be ceded to Montenegro; and although the inhabitants threaten armed resistance to an unwelcome transfer of their allegiance, the annexation may not improbably be completed without bloodshed. On the cession of the frontier district, and after the signature of the treaty, the return to Russia of the army of which the headquarters are now at Adrianople will immediately begin. The troops which occupy East Roumelia will, according to the stipulations of the treaty, not be withdrawn before the beginning of May; but the most effectual security for peace will consist in the removal from the neighbourhood of Constantinople of the army which, but for the presence of the English fleet, would perhaps have entered the capital nearly a year ago. A long time must elapse before the next invasion of Turkey. The exhaustion caused by a successful war has perhaps not been as great as that which followed the struggle with England and France in the Crimea; but the chronic policy of aggression will scarcely be resumed for many years to come.

The untoward and unavowed opposition of the Porte to the Austrian occupation of Bosnia collapsed long ago; and there is reason to suppose that the relations of the two Governments are now friendly, as their main interests are identical. It is improbable that the province will at any future time be restored to Turkish rule, nor is it certain that the loss of territory will be an unmixed disadvantage. The more vigorous administration of Austria will probably prevent the recurrence of the disorders which furnished the first pretext for the Russian invasion. There is too much reason to fear that, after a longer or shorter interval, East Roumelia, and perhaps the European provinces which are still directly subject to the SULTAN, may, in accordance with former precedent, be disturbed by foreign intrigues; but it will no longer be practicable to send Russian agents and supplies of arms into Bosnia and Herzegovina. The Austrians will also relieve the Porte from a standing embarrassment by keeping the Montenegrin freebooters in order. The Turkish Government will perhaps find less difficulty than before the war in cultivating friendly relations with Servia and Roumania. Both States have had recent and painful experience of Russian alliance and protection. A new Servian war, such as that promoted by Russia in 1876, would be discouraged by Austria; and possibly the Servians themselves are partially satisfied by their territorial acquisitions, and by the formal recognition of the independence which they had long practically enjoyed. The antipathy of the Roumanians of all classes to their overbearing patrons probably equals that of the Turks themselves. In future invasions of Turkey the Roumanian army will perhaps not join the aggressor.

The determination of the Greek frontier may be attended with difficulties of detail and with consequent delay, but an episode in the general settlement of South-Eastern Europe will not be allowed to defeat the general scheme. The Turks can scarcely be expected to sympathize with the motives which induce France and England to promote the interests of Greece. The French Government may perhaps be in some degree ac-

tuated by a not unnatural desire to resume the interrupted tradition of an active policy. A French army liberated the Morea, after a French fleet had taken part in the questionable exploit of Navarino. Although the Greeks have repeatedly expressed their desire for a special connexion with England, they have on some occasions found greater sympathy for their more ambitious aspirations in France. NAPOLEON III., with characteristic vacillation, alternately encouraged the Cretan insurrection which was promoted by the Government of Athens, and acquiesced in the more prudent and pacific policy of England. M. WADDINGTON found and seized the opportunity presented by the negotiations of Berlin of making himself a conspicuous advocate of the claims of Greece. The English Cabinet has since been less urgent in applying pressure to the Porte at a time when Turkey was involved in complicated embarrassments; but England as well as France wishes to encourage the most energetic of Eastern races, foreseeing the not impossible contingency in which the Greeks may be required to supply the place of the decaying nation which has for centuries been dominant between the Adriatic and the Egean. Another reason for cordial co-operation is furnished by the expediency of cultivating good-will between the two great Western Powers. It may be hoped that the jealousy which was caused by the annexation of Cyprus has by this time abated; but French politicians will be better satisfied with the result of recent transactions if their Government has contributed its share to the general pacification. By the end of the coming spring there is every reason to believe that peace will be securely established. The English Government will then have the opportunity of trying under favourable conditions the singular experiment with which it charged itself by the Anglo-Turkish Convention. The advantages of the imperfect annexation of Cyprus, and of the engagement to reform the administration of Asiatic Turkey, have not yet been disclosed to the world at large in an intelligible form; but some confidence may fairly be reposed in a Government which, in extraordinarily difficult circumstances, has maintained peace without dishonour.

GERMANY.

THE measure for the repression of Socialism has been supplemented by a proposal for restraining and punishing license of speech in the German Parliament. The proposal is stated to have come from the EMPEROR himself, and Prince BISMARCK only appears as the mouthpiece of his master. It is, however, so much in accordance with opinions which Prince BISMARCK has repeatedly expressed, that he may be glad to have so excellent an opportunity of allowing the EMPEROR to have his way. The object of the new Bill is to make members of the German Parliament afraid to give utterance to sentiments which the Government would regard as injurious to itself or as subversive of order, and perhaps still more to prevent sentiments of this kind gaining publicity under the shelter of Parliamentary reports. The Bill begins by declaring that the Parliament is to have the power of punishing its members; and punishment is to be inflicted by a Committee specially chosen at the beginning of each Session, consisting of the President and the two Vice-Presidents of the Parliament and ten other members; and one of the three Parliamentary officials with six other members is the smallest number that can act at any one time. No intimation is given of the nature of the expressions which are to call forth the action of the Committee; but, if the Committee disapproves of anything a member has said, it can proceed to punish him. It may simply reprimand him, or it may require him to apologize before the assembled Parliament, or it can fix on a time during which he shall be excluded from Parliament. It can, if it pleases, exclude him during the whole of the remainder of the term during which the then Parliament lasts; but, if it goes as far as this, then the member may appeal to the Reichstag from the decision of the Committee. If he does not so appeal, or if on his appeal the decision of the Committee is confirmed, then an additional punishment may be inflicted, and the Committee, being moved so to act by twenty members outside of its own number, may decree that he shall not be eligible for any future Parliament. If, again, what is said would constitute an offence against the criminal code if not uttered in Parliament, then the Parliament, on the motion of the Committee, may hand him over to the ordinary tribunals to be dealt with according to law. Such are the provisions for restraining and punishing license of speech. There is nothing more than is reasonable and necessary in declaring that a Parliament shall have jurisdiction over its members, and up to a certain point it may be said that the House of Commons has the jurisdiction which is now to be given to the German Parliament. It can reprimand, it can require an apology, it can suspend an offending member from attendance in Parliament for a limited time. It can even do two things which it is not proposed that the German Parliament shall be able to do; for it can expel a member, and it can commit him to the custody of its own officers. What is special in the German proposal is the delegation of the power of Parliament to a small Committee, the possibility of declaring the offender ineligible for the future, and the power of handing him over to the courts of law. There is something to be said in favour of the delegation of authority. A Committee can consider the alleged offence with more calmness than might be found in the Assembly itself in a time of excitement; if the Committee inflicted punishment where the Parliament itself would not have inflicted it, its members would be certain not to be re-elected; and, as there is to be a fresh election every Session, an erring Committee would soon find its power gone. The declaration of perpetual ineligibility appears to be far too serious an interference with the freedom of election. That twenty members should be required to concur offers no security against abuse. If the Government happened to have got a Committee that would do its bidding, it would be sure to have twenty members at its command, and then a member whom the Government disliked or feared might be prevented for the rest of his life from sitting in Parliament, and his constituents would never return the man they specially wished to represent them.

Far the most serious part of the measure is the power given to hand over an offender to the ordinary courts of law. It is true that here the Parliament itself must concur, and it may be said that Parliament itself would never concur unless the offence was of a very glaring kind. But the Government would always be able to put a very strong pressure on members, and would treat as disloyal all who protected an offender who had transgressed the ordinary law. The mischief of the device is that, by adopting it, the legal standard would become the Parliamentary standard. If it was once discussed whether an expression came within the terms of a section of the Code, the inevitable tendency would be to judge of what was said in Parliament by what was punishable in a court of law. Those who thought Parliament should not interfere would be stigmatized as wishing to protect a criminal. And, if the legal standard were once adopted, the German Parliament might as well cease to exist. There could be nothing like debating, no expression of honest opinion, nothing of the check on misgovernment which is secured by Ministerial acts being submitted to Parliamentary criticism. It must be remembered what are offences under the German Code. One German has recently been condemned for stating in August, when the Bill for the repression of Socialism was sufficiently sketched for the public to be aware of its contents, that it was a measure which ought not to have been brought forward. Another German is now being prosecuted for professing that he found it difficult to believe the story that the EMPRESS had sent the present of a sacred picture to a bishop who has been suspended for refusing to obey the law. It is a criminal offence in Germany to turn Prince BISMARCK into ridicule, or in any way to attack his dignity. At the present moment the few journals of respectability that are not under the control of the Government are at their wits' end to find phrases not punishable by law in which to convey to their readers the opinion that a measure emanating from the EMPEROR and countenanced by Prince BISMARCK is a bad measure and fatal to Parliamentary liberty. If members of Parliament were to be bound by the same rules, they could never venture to differ from the Government except in the mildest and gentlest way. It is not that many members would actually be handed over to the courts of law. That is not the evil to be feared. What is to be apprehended is that the whole spirit and life of Parliament would evaporate. Speakers would be expected, and would gradually learn, to obey the law—that is, to say nothing in Parliament which ordinary men would not venture to say in a beer-house when they

knew a policeman was present. If the Parliament passes this clause, it will simply commit suicide.

The provisions as to preventing publication of objectionable expressions used in Parliament are as follows:—The President is empowered to inhibit the temporary appearance of all improper expressions in the shorthand report. This inhibition is to last for not more than three days; but if before that time has expired the Committee takes up the matter and punishes the offender even by merely reprimanding him, it may also order that all notice of the expressions for which punishment shall be awarded shall be permanently excluded from the Parliamentary report, and no journal or other publication is to be allowed to reproduce them. If the temporary inhibition of the President or the permanent inhibition of the Committee is disregarded, an offender is to be punishable by imprisonment, which may extend to three months, or may be dealt with more severely if the expressions are in themselves unfit to print. Here, again, it must be admitted that there is something reasonable in the Government proposal. It is not going beyond the proper scope of Parliamentary jurisdiction to say that Parliament shall have some control over what is reported of its debates. The publication of the debates of the House of Commons is quite a modern practice. Parliamentary reporters have no claim to be present; the House of Commons still occasionally exercises the privilege of stopping all reporting, by ordering strangers to retire; and until very lately this was a privilege which any single member could exercise. In practice, no doubt, it is the acknowledged rule that the nation shall know what is said in Parliament; and in countries where, as in Germany, there is an official shorthand report, the claim of the nation to have proper information on the subject cannot be disputed. But it is going very far to say that a nation has a right to know all that is said in Parliament, whether what is said is against the rules of Parliament or not. The speech made in the German Parliament by a Socialist deputy named HASSELMANN, in which he told Prince BISMARCK that he and his friends were ready, if pushed to extremities, to fight and die for their cause, was an utterance as to the propriety of reporting which the Parliament might have fairly exercised its judgment. Here, again, we come back to the main question, What expressions are to be considered unparliamentary? If Parliament does not have its own standard, but adopts such a standard as is furnished by the German Code, the question as to what ought to be reported may slumber, for nothing will be said in Parliament worth reporting. But, if there is the due latitude of free, fearless Parliamentary debate, and a legitimate amount of abuse may be poured on bad Ministers and bad measures, expressions obviously going beyond this latitude need not be published in order that Parliament may be independent and the country made acquainted with what Parliament is doing and saying. If the German Parliament has now none of the powers which the Bill proposes to confer on it, a Bill conferring some proper powers appears to be expedient; and when this is once admitted all the details of the Bill become matter of fair discussion, except the clause adopting the legal standard of propriety of speech as the Parliamentary one.

SIR WILLIAM HARCOURT AT OXFORD.

SIR WILLIAM HARCOURT'S brilliant speech at Oxford was admirably adapted to its immediate purpose. The pleasant excitement of effervescent party feeling, the encouragement offered to the prejudices of local supporters, were legitimately rewarded by enthusiastic applause. To find a match for the most effective combatant of the Opposition the Conservatives must satisfy the impossible condition of restoring Lord BEACONSFIELD to the House of Commons in the full vigour of his prime as when he assailed Sir ROBERT PEEL. It is not too much to say that the political prospects of the party would have been perceptibly brighter if they had enjoyed the good fortune of enrolling Sir W. HARCOURT in their ranks. There is reason to suspect that the divisions and jealousies of the Liberals and their miscalculations of national feeling, and even the perilous eccentricities of Mr. GLADSTONE, may escape notice or be forgotten because there is no sparkling rhetorician on the Government benches to denounce with unqualified and epigrammatic severity the shortcomings of his opponents. Sometimes the most effective advocate errs by excess of vehemence. When the Oxford Liberals returned home, and when the fumes of eloquence had evaporated, some of the cooler heads may perhaps have reflected that their accomplished representative had proved too much. Although he had not repeated the mistake of gloating with undisguised satisfaction over the failures of English policy, his admirers may, on calmer consideration, have thought it strange that the Government which has for several years commanded a large majority in Parliament should never by accident have blundered into a just or prudent policy. If Sir W. HARCOURT'S speech were examined in an equally hostile spirit, it would perhaps be open to charges of inconsistency and unfairness; but an orator is often well advised in taking the offensive without fear of retaliatory criticism. The audience recognized the moderation with which, at the beginning of his speech, Sir W. HARCOURT disclaimed the purpose of attributing commercial distress to the Government, and the boldness with which, in the following sentence, he deduced the depression of trade exclusively from the alleged apprehension of war which, as he said, was wholly caused by the Ministerial policy. Controversial artifices of this kind are so familiar that they are perhaps morally excusable; but they have no influence on the deliberate judgment of serious politicians. There is a fallacy in the implied assumption that a foreign policy is necessarily erroneous because it may involve a risk of war. If war is in any case justifiable, measures which tend to war admit of the same defence, although war, whether necessary or injudicious, is likely to produce commercial distrust. When Sir W. HARCOURT last spoke at Oxford, he thought himself entitled to exult in the prospect that the Treaty of Berlin would prove abortive. The execution of all its main provisions has since been assured; and yet trade has shown no symptom of revival. The only circumstance which is common to both periods is that Sir W. HARCOURT attacked the Government then and that he attacks the Government now.

The liberties which may be taken by an able orator with a popular audience are illustrated in the bold assertion that the Government has for three years defended Turkey, and that Turkey has nevertheless in that time lost a large portion of territory. It is of course notorious that, partly by its own choice and also through the efforts of the Opposition, the Government allowed the Russian armies to invade, and partially to conquer, Turkey without attempting to defend it. Lord BEACONSFIELD has since expressed the probable opinion that a firm resistance would have prevented the war; but the correctness of a hypothetical proposition is scarcely worth the trouble of examination. The defence of Turkey by England is only imagined for the purpose of antithesis; and there is not much advantage in contrasting the fact of the conquest of Turkish provinces with the fiction of an armed defence which was never attempted. The English Government never undertook any task of the kind until, against the vehement protest of Sir W. HARCOURT'S political allies, the fleet entered the Sea of Marmora to protect Gallipoli and Constantinople. The object was at once fully attained; the Russian army suspended its further advance; and there were not even materials provided for another rhetorical antithesis. Confident prophecies are so far safer than apocryphal history that they cannot be confuted at the moment; but the arguments which Sir W. HARCOURT founds on his own anticipations of the prospective disasters of Turkey will only be valid if after several years they are confirmed by experience. It is characteristic of his controversial method that, in criticizing the Berlin arrangements for the government of Eastern Roumelia, he carefully abstains from noticing the principal reason for detaching the province from Eastern Bulgaria. The SULTAN is empowered by the treaty to occupy the defensible position of the Balkans, instead of admitting an independent, and perhaps hostile, neighbour into the vicinity of C[illegible]inople. The modifications which were introduced [illegible] Berlin negotiations into the provisions of the treaty of San Stefano were approved by France, by Austria, by Italy, and by large majorities in England. Sir W. HARCOURT has a right to hold and express a contrary opinion; but, while he accomplishes the immediate purpose of eliciting a ready cheer, he weakens his own contention by representing the conduct of the Government as transparently absurd.

Even the description of Cyprus, though it was highly amusing and approximately just, lost some of its effect by exaggeration. The supposed return of VENUS to the lawful embraces of VULCAN was a happy illustration, though the conveniences of a coaling station are not to be despised. If Cyprus is as useful as Gibraltar for the supply of coals to the fleet, some compensation will be found for the cost and risks of an annexation which has never been intelligibly explained. The part of the Anglo-Turkish Convention which applies to the administration of Asiatic Turkey was equally open to damaging criticism; but in this part of his speech, as in the remainder, Sir W. HARCOURT was not content with the facts of the case. There is too much reason to fear that the reforms proposed by Lord SALISBURY will be subject to delay and to possible failure; but the Porte has verbally accepted the most important recommendations; and it is not certain that gradual improvements may not be introduced. Speakers who positively denounce the Turks as destined to ruin and extinction forget, as Sir W. HARCOURT forgot, that in the Asiatic provinces they form the bulk of the population, and that they number several millions. There is no reason to expect that they will be speedily exterminated; and it is not evidently criminal to attempt, even with the chance of failure, some permanent improvement in their condition. It is at least conceivable that the influence of England may produce beneficial results, if Sir W. HARCOURT and his friends, when they come into power, are not prepared at once to renounce the duties and responsibilities which have perhaps been imprudently undertaken. The policy which was devised by Lord BEACONSFIELD and Lord SALISBURY, and which Sir H. LAYARD strives with indefatigable zeal to execute, is at least more generous than the prudent abstinence which is preferred by Sir W. HARCOURT.

It is not to be regretted that little room was left at the end of the speech for the expression of party feeling in the matter of the Afghan war. The complete and unforeseen success of the winter campaign may have greatly disappointed the Liberal party, but it ought to receive notice in their speeches against the Government. If the report is true that SHERE ALI has offered to acknowledge the sovereignty of the Emperor of RUSSIA, the war has ample retrospective justification. The withdrawal of the Russian Government from interference in Afghan affairs has followed the advance of the English columns through the passes; and there is no reason to suppose that the result could have been attained by other means. Notwithstanding the denunciations which are addressed to an imaginary representative of a braggart and turbulent policy under a cant nickname, the recent devotees of the "Divine Figure from the "North" have lately thought it expedient to affect a competitive jealousy of Russian ambition. Mr. GLADSTONE has, with singular simplicity, attempted to describe the Ministers as the friends of Russia, and his own faction as her foes. The country will on the whole incline to the belief that hostility is indicated by resistance. It was not an act of friendship to exclude the Russian army from Constantinople, or to compel the withdrawal of the Russian Mission from Cabul. On the whole, it may be admitted that Sir W. HARCOURT deserved the applause of his constituents; but eloquent invective and ingenious satire only convince while the presence of the orator still controls the imagination and feelings of the audience.

THE FRENCH MINISTRY.

THE indications already given of the probable action of the French Left have taken most Englishmen by surprise. To some extent this may be explained by the fact that they have taken the Paris Correspondent of the *Times* by surprise. A few days ago he was confident that the Left were not going to make the mistake of turning out the present Cabinet, while yesterday, in describing the reception accorded to the Ministerial declaration, he writes as though the Left had taken leave of their senses, and he had no hope of their ever returning to them. We shall hardly be far wrong in making allowance for some exaggeration in both these estimates of the state of affairs. It was never quite safe to assume as confidently as many Englishmen did that when once the Senate had been brought into harmony with the Chamber of Deputies the troubles of the French Republic were over; and it may be equally unsafe now to assume that because the Left have grown excited over their victory, they are prepared at once to scuttle the ship in a kind of drunken glee at finding themselves masters of it. If this last prediction is fulfilled, the apparent evidence of facts must have been strangely misleading. It has been said at one election after another that the country was more and more coming round to the Republic, and that the secret of its conversion was the steady growth of a conviction that, taking all circumstances into account, the Republic is the most genuinely Conservative Government that can be set up in France. If this is so, there can be no real desire on the part of the electors to see revolutionary changes proposed in the Chambers.

Against this view, it may be said there is the unmistakable evidence that the Left are hostile to the existing Cabinet, and the ground of this hostility can only be the unwillingness of M. DUFAURE to introduce revolutionary measures. Two things, however, may be said in qualification of this conclusion. In the first place, the coldness of the Left in the Chamber of Deputies may to some extent have been calculated. They may have argued that there is still time and opportunity for Ministers to give backbone to their programme. At present it is little more than a list of subjects with which the Cabinet proposes to deal. Commiseration is to be extended to a certain number of the condemned Communists. The Government will watch over the observance of the laws which regulate the relations between the Church and the State. They will show themselves inexorable against officials who attack or calumniate the Republic. Elementary education is to be made compulsory, and all teachers must be certificated after an interval for preparation has been allowed to them. It will be seen that upon all these points it is left uncertain how far the Government are prepared to go. They have yet to determine how many Communists are to be pardoned, how strictly the laws which regulate the relations between the Church and the State shall be executed, what degree of hostility shall be included in the words "attack or calumniate the Re-"public," under what conditions elementary education is to be made compulsory, how short may be the interval granted to teachers belonging to religious communities to qualify themselves for a certificate. The declarations made by Ministers in the course of the debate which is to begin on Monday may make an immense difference in the signification of the programme read on Thursday, and the coldness of the Left may only be intended as a warning to the Cabinet that the gloss that will then be put upon their text is of more importance than the text itself. Standing by itself, the Left may be supposed to say—There is nothing in the programme to excite our enthusiasm. If you wish us to support you, you must be careful to put some life and colour into these cold generalities. In the second place, the Left in the Chamber of Deputies may be hostile to the existing Cabinet, and yet the country may not be hostile to it. It is the misfortune of France that none of the elections since 1870 have turned on questions of policy. The form of Government has never been sufficiently secure to allow of the electors' minds being directed to what they would wish a secure Government to do. Even the elections to the Senate were not uninfluenced by the knowledge that the return of a Conservative majority would threaten the existence of the Republic, while the present Chamber of Deputies was elected in answer to a direct invitation from the enemies of the Republic to accept the personal rule of Marshal MACMAHON as a stepping-stone to some kind of restoration. Consequently the genuinely Conservative instincts attributed to the electors have never had any proper occasion of manifesting themselves. The one object of the constituencies has been to return Republican candidates, and they have consequently taken Republican candidates pretty much as they came. Very often probably they have accepted a candidate of more extreme opinions than their own, because to put forward one with whom they agreed more closely would be to divide the Republican voters, and perhaps let in a partisan of the reaction. The National Assembly lay throughout its life under the disadvantage of having been elected for one specific purpose, that of concluding peace; and the present Chamber of Deputies lies under a similar disadvantage. It, too, was elected for one specific purpose, that of upholding the Republic against the men of the 16th of May; and, just as the National

Assembly proved not to represent its constituents on the form of government, so the Chamber of Deputies may prove not to represent its constituents on the composition of the Cabinet.

It must be admitted, however, that there are great difficulties in the way of giving effect to the views of the electors, supposing them to be of this Conservative type. The Chamber of Deputies has nearly four years more to live, and though it may be dissolved by the President, with the consent of the Senate, it is very doubtful whether this consent could be obtained. It is true the Senate did not receive the Ministerial statement with the same coldness as the Chamber of Deputies; but, as the Correspondent of the *Daily News* points out, against this must be set the fact that the Senate has elected M. Martel as its President over the head of M. Jules Simon. And the recommendation of M. Martel is the one which, as the *République Française* naïvely said, the new Minister of War does not possess, that of being M. Gambetta's nominee. If M. Gambetta has really inspired the hostility which the Left apparently feels towards the Cabinet, it is scarcely probable that he will wish to exchange a Chamber which is prepared to give effect to that hostility for one which may possibly show itself friendly to M. Dufaure; and on the assumption that he is supreme in the Senate as well as in the Chamber of Deputies, there can be no dissolution without his consent. If, on the contrary, the hostility of the Left to the Cabinet is not shared by M. Gambetta, that would seem to show that his power in the Legislature is less than has been supposed, and in that case he might not be able to induce the majority to pass so self-denying an ordinance as on this hypothesis a dissolution would be to it. The prospect is further complicated by the fact that 1880 is the year appointed for the revision of the Constitution, and with this in view it is by no means certain that it would be possible to obtain a Chamber of Deputies elected with exclusive reference to the maintenance or overthrow of a particular Ministry. A Chamber of Deputies elected in 1879 would probably be the Chamber upon which, in conjunction with the Senate, the work of revision would fall; and for this reason the same considerations which have influenced the Republican electors hitherto might be expected to influence them again. Once more they might feel that they had the fate of the Republic in their hands, and that, with a revision of the Constitution impending, it was more important to elect a Republican than to elect any particular kind of Republican. When such a feeling as this is in the air, it is always the most extreme party that profits by it. An extreme party is usually careless about consequences, and if it cannot elect a candidate of its own way of thinking, it will often prefer the candidate most opposed to itself to a candidate who goes half-way with it and then stops short. The result is, that the only way of making sure of a Republican victory is to take the most extreme candidate. How to obtain an election which shall treat the form of Government as finally decided, and busy itself with nothing except the policy to be pursued by the Cabinet, seems for Frenchmen to be an almost insoluble problem. Until it is solved, however, the course of French affairs can never settle down into the humdrum regularity of countries which are content to leave their institutions alone.

TRADE DISPUTES.

Now that the strike on the Midland Railway has collapsed it is easy to see that it never had a chance of success. The men who left their work, much to their credit made no attempt to molest or intimidate the substitutes who took their vacant places. After a day or two it was ascertained that any number of new hands was forthcoming, and the Directors were latterly able to select competent persons as guards of the goods trains. It would be unfair to criticize harshly the misleading language which was used by the leaders of the strike. Probably their followers may understand that assurances of success are not to be implicitly believed; but, if any men have been permanently deprived of employment through their reliance on false or inaccurate statements, they have much reason to complain of misrepresentations which cannot have been always unintentional. The signalmen, who had the good sense to allow an opportunity for negotiation, have obtained some relaxation of the terms originally offered by the Board. A classification, for the purpose of fixing wages, of more or less laborious signal stations, seems so reasonable as to cause some surprise that the arrangement had not been made earlier. It appears that some misapprehension has prevailed among the goods guards as to the operation of the "trip" system to which they objected; but perhaps, like many other working-men, they dislike piece-work, or payment in proportion to the results of labour. It seems equitable, as it is obviously conducive to public safety, that payment for working a goods train between two points should be made according to the time which ought, in default of exceptional circumstances, to be occupied on the journey. More than half of the accidents on railways are caused by want of punctuality; and when the guards were paid by time, instead of by distance, they had no motive for exerting themselves to maintain proper speed. The manager of the line has stated that they are entitled to allowance in the not unfrequent case of unavoidable delay. The "trip" system will be maintained; and it is worth notice that, although it formed one of the pretexts for the strike, it had been established some time before the late reduction of wages. The increase in the number of hours during which the men are required to work affects the payment for overtime rather than the duration of labour. The additional allowance will begin later than before the change; and the receipts of the men will be proportionally reduced. It is satisfactory to know that the necessaries of life are now unusually cheap, so that a diminution of income will be more tolerable than in ordinary times. The Midland Board will probably take care to provide employment for as many of its old servants as possible; and it may be hoped that those who are by their own act displaced will be able to transfer their services to other railways. Although some of the speakers at the meetings unwisely boasted of the inconvenience caused to passengers and freighters, the men made no concerted attempt to profit by the dependence of the community at large on their services. The great majority of the persons employed by the Company submitted without resistance to a reduction which must have been unwelcome to all. In the course of the discussion it has been stated that the reduced wages on the Midland line are equal to those which are paid on other railways. There has been a simultaneous reduction on the Great Northern line, which has happily not produced a strike. The ordinary wages of railway servants are certainly not extravagant; but there are great advantages in an employment which provides more than average chances of promotion, and which is never suspended in the worst of times. The cessation of the strike, while it removes the risk of serious public inconvenience, is also for the interest of the men. They have little reason to be grateful to the great capitalist who strangely volunteered to subsidize the strike.

There is reason to hope that some other trade disputes which seemed to be imminent have been abandoned or adjourned. Intelligent workmen not under the immediate influence of agitators cannot fail to understand that a time of extraordinary depression is unfavourable to their chances of success in a struggle with their employers. The masters are comparatively indifferent to the interruption of their business; and there is little or no competition for labour. A surrender is occasionally disguised in the form of submission to arbitration; and in some cases it is possible to frame and apply rules by which wages may be adjusted; but when the masters have ascertained that they must either reduce the rate of payment or work at a loss, they will seldom bind themselves to take the chance of an award. Arbitration is still more unsuitable to the more serious disputes which relate to the hours of labour. It was not as the result of judicial decisions, but under the pressure of strikes in prosperous seasons, that employers in the iron trade some years ago consented to reduce the working day to nine hours. The result of the change has been so injurious to trade that great efforts are now made to restore the former time of working. No arbitrator can deny that the master suffers by the reduction of the hours of labour while the charge for plant remains the same. On the other hand, the workmen naturally value the concession which they believed that they had permanently secured; and their opinions are not likely to be altered by some of the arguments which have been used on behalf of the employers. Reasonable irritation must be caused by statements, whether true or false, that much of the

time which is no longer devoted to work is spent in idleness or dissipation. Inquisition into the private habits or tastes of any part of the community is inconsistent with modern notions of social freedom. It is more to the purpose to prove that high wages and short hours encourage the foreign competition which equally affects the interests of masters and of men. In some instances workmen have exhibited a cynical and suicidal indifference to warnings of the inevitable effect of their obstinacy in making it impossible for the employers to accept contracts offered on certain terms; but, in the long run, even members of Trade-Unions must be convinced that the discouragement of English industry must be ruinous to themselves. A contractor whose statement has been recently published quotes a declaration of certain Birmingham workmen, that, if an order went from their own town to Belgium, they would follow it and enjoy an outing. He adds that the men who refused employment are now suffering extreme want, and that the maintenance of their families devolves on the manufacturer whose proposal they rejected.

The same writer dilates on the superiority of Americans to Englishmen in the manufacture of certain articles; but the comments and contradictions which his letter has elicited illustrate the difficulty of ascertaining the most rudimentary industrial facts. It seems that Mr. Hill as a contractor supplies to his customers locks of a certain pattern which he can, as he says, procure more cheaply from the United States than in his own immediate neighbourhood at Willenhall. The angry tone in which he writes of English workmen suggests a suspicion that he is not exempt from prejudice; but a trader seldom allows his feelings or passions to interfere with the conduct of business. Mr. Hill would probably not import locks from America if he could buy them cheaper at home. There is much probability in his assertion that locks, like many other articles, can be made more cheaply by machinery than by hand; and it would appear from his letter that the Willenhall manufacture is in the hands of small independent makers. A local critic declares that Mr. Hill finds it expedient to use the Willenhall trade-mark for his American goods; and he adds the statement that the small manufacturers have now generally become journeymen in larger establishments. The real question is whether foreign producers are successfully competing in English markets.

THE BLOCK IN THE COURTS OF LAW.

THE experiment is now being tried of having a Winter Circuit for the delivery of gaols, making a fourth circuit in the year, and of combining with it a clearance of local civil business. The civil business in the provinces, of a nature beyond the jurisdiction of County Court judges, used to be despatched in the spring and in the summer, that is in March and July, and it was only at these times that the judges cleared the gaols. The first innovation was to have a third gaol delivery in December for places where there was enough business to make one seem necessary. A short time ago the House of Commons insisted on a further change. It thought the detention of prisoners waiting their trial for months together a scandal to English justice, and the Government, in compliance with the wish of Parliament, ordered that there should be not three, but four, gaol deliveries in the year, and that this rule should apply throughout England and not merely in populous centres. These deliveries will now be held in January, April, July, and October; and as there was to be a gaol delivery in January it was thought it would be more convenient that the first half-yearly despatch of civil business should be made at the same time, instead of a little later in the year. The judges are therefore now engaged in making a new delivery, and in anticipating the period at which they were accustomed to despatch civil business. They do not, or at least some of them do not, at all like the change, and they are grumbling loudly at its consequences. Although so many judges are necessarily absent an attempt is still made to carry on London business. The Lord Chief Justice is staying in town, and has openly complained that the conduct of London business at such a time is a farce. He told counsel that he really had not the smallest notion what could or could not be done by the tiny handful of judges left in town, and he pointed out that there were nearly a thousand cases waiting trial, and the courts were so blocked with business that suitors were defrauded of justice. The right remedy was, he hinted, to increase the number of judges. Nor can there be any doubt that the new system produces great inconvenience, both to suitors and to the judges themselves. One day this week the Chief Baron had to rush up from Maidstone and leave the suitors of Kent waiting in the cold, because there was business in the Exchequer which required his instant attention; and if new judges are really wanted, they ought to be created, and the present House of Commons is not at all like to grudge the cost. But it is by no means clear at present that new judges are wanted. It must be remembered that under recent changes three extra judges have been provided for circuit purposes. Three out of the justices of appeal are told off for circuit work. Lord Justice Brett is now on the North-Eastern Circuit, and Lord Justice Cotton has just been trying a great murder case at Maidstone. Lord Justice Thesiger is ill, but his place on circuit is supplied by a Commissioner. Then that the judges are just now peculiarly shorthanded is the effect of a temporary accident. For so great a purpose as that of consolidating the criminal law, Mr. Justice Lush and Sir James Stephen have been taken away from judicial duties, and when they have done this piece of special work they will be immediately added to the judicial force. Lastly, the Londoners may be said to be suffering now what in former years they had to suffer in March. The judges, not being in London, cannot attend to their business; but when March comes the judges will now be in London instead of away as formerly, and the Londoners will gain then what they lose now.

The preliminary question, whether there should be four gaol deliveries in the year, although settled in the mind of Parliament, appears to be by no means settled in the minds of the judges. So far, indeed, as they have come to a conclusion, they seem to be strongly of opinion that four gaol deliveries are not only a nuisance to all concerned, but a totally unnecessary nuisance. It seems to them a great pity and a great hardship that judges and counsel and grand jurors and ordinary jurors and witnesses should all be summoned to some remote little country town in the depth of winter, in order that a slender list of petty crimes may be got through, and a few humble prisoners released or condemned a little sooner than they otherwise would be. This, in the view of some of the judges, is to pet the wicked and to afflict the good. Extreme consideration is shown for the few vicious, and no consideration is shown for the many virtuous. The grand jurors naturally feel the inconvenience of being torn from their homes at this season, and chat the matter over in the most friendly manner with any judge who happens to be specially sympathetic. And no grand jury could wish for a judge more sympathetic than Mr. Justice Denman. He really is a judge after a suffering grand juror's heart. For he is ready to cut away the ground on which the promoters of the change felt themselves unassailable, and denies, not only that consideration ought to be shown to prisoners, but that consideration is shown them under the present system. The way in which he looks at the matter is this. If a prisoner is tried, he is condemned or acquitted. If he is condemned, the longer he has been kept waiting in prison before trial the better for him, as the treatment of prisoners before trial is much milder and pleasanter than that which they receive after condemnation. The earlier arrival of the judges is for them simply the earlier substitution of hard labour for simple detention. If a prisoner is acquitted, Mr. Justice Denman's experience enables him to assert that in ninety-nine cases out of a hundred he escapes, not because he is not really guilty, but because the law cannot punish him for want of proof. Detention in prison is, therefore, a very trivial punishment for his actual, though not provable, guilt; and, although this punishment must be sadly inadequate, yet the more of this inadequate punishment he gets the more a virtuous society ought to be pleased; and nothing can be more disheartening than that this term of just suffering should be abridged by summoning good comfortable people like judges and grand jurors, at a preposterously early and most inconvenient time, to set him free, as it is called, or, as it would be more accurate to say, to let him off a portion of the only punishment society can inflict on him. There is, however, the conceivable case of the one white sheep, the hundredth man who is acquitted, and here it might be thought that Mr. Justice Denman would have to

own that it is nothing more than proper consideration for such a man to secure his release from prison as soon as possible. Not in the least. Mr. Justice DENMAN utterly denies that it is any kindness to release a man from prison. Most prisoners are poor men, and to poor men it is a positive advantage to be in prison. They are sheltered, warmed, clothed, and fed. They are the true lilies of the English field. They do nothing, and yet are very comfortable. They have not to share the rough lot of those who have not had the great good fortune to be falsely accused. They need not shiver in the wintry weather, seeking in vain for employment, begging a crust here and a faggot there. They have drawn a prize in the lottery of pauper life, and now a cruel Government robs them of their prize, and makes judges and grand jurors reluctant accomplices in their cruelty.

Every now and then, when a question is under the consideration of Parliament or the public, some one manages to relieve every one from the trouble of further controversy by putting a point with so much felicity and force that all feel that nothing more need be said. When a judge has once placed the objection to frequent gaol delivery on the grounds that accused persons may be presumed to be guilty, and that it is cruel to a poor man to wrench him from the comforts of prison and to restore him to the miseries of freedom and his family, the House of Commons will feel that it wants no more to confirm it in its resolution. If it was ever doubtful, it is now certain beyond all question that there will be four gaol deliveries in a year. If, therefore, the institution of so many gaol deliveries makes an increase in the number of judges necessary, their number must be increased. But the Government feels a very proper reluctance to increase the number of judges, unless the increase must be made if the judicial business of the country is to go on. There has in recent years been a very large increase in the number of judges. There are the new Law Lords, the paid members of the Privy Council, the four new Justices of Appeal, the new Vice-Chancellor. There is a natural fear lest, if the Bar is called on to supply more judges than it now supplies, the quality of the Bench may deteriorate. It has been argued, and apparently in humble earnest and not in the spirit of covert irony, that there can be no difficulty in finding good judges, as any plain man with good sense and decent manners and a little knowledge of law will be as good a judge as there is any real occasion to have. If so, of course the whole difficulty vanishes; as, no doubt, the Bar could supply the Government with at least a hundred good judges every year. But it is not strange that a Chancellor should have a more exalted notion of what is required in a judge. He may have, and probably must have, occasionally to adopt this cynical view of the requisite qualities of a judge in order to reconcile himself to rewarding political supporters by a judgeship. But, on the whole, each Chancellor in turn likes to make good judges. Lord CAIRNS has, for example, just given himself the satisfaction of disregarding political ties altogether, and of looking only to the eminence of qualifications. Sir JAMES STEPHEN has rendered the nation, and more lately the Ministry, a great service by making the Criminal Code possible, and if a judgeship is to be looked on as a reward, there could not be a reward better merited. But it is something much more than a reward. It implies, or ought to imply, an effort to benefit the country by the selection of the best man for the place that can be got. In Sir JAMES STEPHEN the CHANCELLOR has found a judge who may be confidently expected to make a really strong judge. It is difficult to say how such expectations can be better warranted than by the union of varied knowledge, a practised art of putting things intelligibly, an acquaintance with law as it is administered not only in England, but in India, the grasp of principles implied in the construction of a Code, a strong will, indefatigable industry, and perfect independence.

THE BANK LOTTERIES.

THE lotteries which it is proposed to set up in aid of the liquidation of the City of Glasgow and the West of England Banks will certainly deserve to be recorded among the curiosities of human inconsistency. The second and smaller of the two may be dismissed without further comment. The project has obviously been started in imitation of the more important scheme in the North, and will, in the event of that larger scheme coming to nothing, not be persevered with. Even if the idea had first been started in Devonshire, it would have been less remarkable than the same idea coming from Glasgow. If the mischiefs of the proposal were less serious, the notion that a project for reviving lotteries should owe its existence to Scotchmen would be full of humour. It is not often that we find such a strange series of contradictions between character and action. The spectacle of a cautious people encouraging the most dangerous form of speculation, of a people supposed to reverence law setting an Act of Parliament at defiance, of a religious people mixing up charity and gambling, and doing and encouraging evil in order that good, in the shape of money, may come to certain unfortunate bankrupts, is really almost without a parallel. The only explanation that can be suggested is that much loss of money has turned their heads. If they have not lost it themselves they have seen others lose it, and the prospect is too melancholy, they think, not to make anything permissible which promises, in however slight a degree, to take it out of their sight.

The first fallacy that needs to be got rid of in connexion with this subject is the supposed sanctification of the project by the goodness of the object to which the profits are to be devoted. This theory is at once disposed of by the fact that the profits of the Government lotteries which were made illegal in 1826 were devoted to a most excellent object. If there are to be lotteries at all, there can be no reason why the country at large should not have the benefit of them. If 3,000,000*l.* can be raised by a lottery to pay the debts of the shareholders in the City of Glasgow Bank, why should not a similar sum be raised, if possible, every year to pay off the National Debt, or to increase the national revenue? There is absolutely no answer to this question. If charity is a good reason for holding a lottery, patriotism is an equally good one. If the poor shareholder is a legitimate object of pity, and, being such, may legitimately be helped by a lottery, the poor taxpayer has precisely the same claim. It is impossible logically to defend the Glasgow project and yet approve of the Act of 1826. If lotteries are only bad when they are held for bad objects, they should only be prohibited when they are held for bad objects. Probably the authors of the scheme are not prepared to go this length. They would like to claim exemption from the law for themselves, and for themselves only. But if a lottery be permitted for one charitable object, it will be exceedingly invidious to forbid it for another. There are always abundance of schemes sorely in want of money, and every ticket which is bought for the Glasgow lottery will be an incentive to the supporters of these schemes to copy the Glasgow example. In this way we shall arrive at a state of things which would reproduce all the evils of the prohibited State lotteries without any compensation to the Chancellor of the Exchequer. Charity not unfrequently flags for want of some interest beside and beyond itself, and the news that the charm of a little speculation was to be had, in addition to the pleasure of relieving distress, would have an irresistible attraction for bored benevolence. In this way the disasters arising from the failure of the City of Glasgow Bank would go on multiplying themselves in continually wider circles.

The truth probably is that the long disuse of lotteries has made Englishmen forget the evils of them. One of the first questions which would be addressed to an objector by the authors of this present scheme would probably be whether he never played a game of cards, or had never risked a napoleon at a foreign gaming-table? Those who reason in this way forget that there may be many acts which are quite harmless in the particular case and yet exceedingly injurious to the community if the particular cases become numerous. To buy a ticket in a lottery is just as innocent in itself as to play a game of loo or to bet on a racehorse. Provided that a man has the money to lose, and that the man who will have to pay him if he wins has also the money to lose, the question whether they shall lose it in this particular way must be decided on the principles which ordinarily govern the spending of money in amusement. But there is no doubt whatever that, in proportion as playing at loo or betting on racehorses became general in a community, the morals of the community would suffer, and consequently the State does wisely in forbidding these amusements in public places. The same rule applies

to lotteries. Why should the law prevent a man from spending 1*l.* or 5*l.* in a ticket half the proceeds of which will go to a charitable object and half to the creation of prizes, which he will have a chance of winning? Simply because it is known that, if one man is allowed to spend his money in this way, other men must equally be allowed to do it; and for one man who can do it without injury to himself or to others, there will be ten or twenty who will do themselves and others very great injury. The originators of this Glasgow lottery may be, and probably are, altogether free from the temptation to spend all the money they can scrape together in the purchase of lottery tickets; but they will not be the only or even the principal purchasers. The tickets, if they are publicly sold, will be taken by numbers of men and women to whom 5*l.* or even 1*l.* is a serious matter. They cannot lose it without some one who is dependent on them being the worse for it, and for every one who saves his stake there must of course be numbers who will lose it. The law can hardly be turned to better purpose than in discouraging enterprises of this mischievous kind. If the Glasgow lottery is allowed to go on, it will certainly not remain a solitary case. Lotteries will become the most popular form of charity, because no other will so well minister alike to the sentimental and the speculative tendencies of the time.

It may even be said that, of all forms of speculation, lotteries are the most dangerous. They are so because the risk of loss is strictly limited. If a man could be sure that in a Stock Exchange speculation he would lose only the particular sum he arranged to lose, while having the chance of gaining very much more, the number of speculative transactions would be immeasurably increased. What deters him is the difficulty of calculating his loss; the uncertainty whether he may not in a week or two's time find himself poorer, not by 10*l.*, or 20*l.*, or 50*l.*, but by ten or twenty times these sums. A lottery provides precisely the kind and amount of certainty which is wanting on the Stock Exchange. Each ticket costs a specified sum, and though a man may have a hundred tickets, he cannot lose more than what he has paid for them. On the other hand, with every fresh ticket bought the chance of winning a considerable, perhaps an enormous, prize increases. The purchaser does not consider that even if he holds a hundred tickets his chance of winning one of the exceptional prizes is still infinitesimal; he only remembers that it is greater than it was when he held fewer. In this way the possession of one lottery-ticket becomes an infallible incentive to the purchase of others. And upon whom does this incentive tell with the greatest force? Upon those, of course, to whom the making of money, except by a piece of pure luck, is most impossible. The man who sees no chance of ever getting more than 200*l.* a year is the predestined victim of a lottery. If the members of the Glasgow lottery had only remembered how large a section of the community is covered by this description, they would hardly have cared to have such a scheme upon their consciences. The harm that would be done in the effort to abate the consequences of the Bank failure might be infinitely greater than the harm wrought by the failure itself. The latter at all events does not involve the shareholders in crime. If they lose all that they have, they can at least remain honest. But a lottery on the gigantic scale now proposed is almost certain to involve some of those who take part of it in crime. Here and there the temptation to buy a ticket which may put the lucky purchaser above the reach of poverty for the rest of his life will be irresistible, and the only means of yielding to it may lie through theft in some one of the many forms in which the thief calculates upon being able to put back the money before it is missed. If Glasgow benevolence must encourage gambling, it would on the whole be less mischievous to open a public gaming-table.

PROTECTION FOR RETAIL INDUSTRY.

THE correspondence which has filled so many columns of the *Daily Telegraph* on the question of Co-operative Stores is an extremely curious one. Some of the tradesmen who carry it on profess the most unabashed protectionism, without apparently in the least suspecting it. No man perhaps can be expected to realize the fact that he is of no use to the community, and there are large numbers of shopkeepers to whom it evidently has never occurred that, if there were rather fewer of them, there would be more business and larger profits for those who remained. The fallacy that a country is the richer because a class which would otherwise be producing something else is aided by the Government in producing that which can be produced at less cost elsewhere is at least plausible. But the fallacy that a country would be richer if the distributing class were kept unnaturally large is so transparent, that it is strange it should have imposed upon even the most ignorant contributor to this correspondence. For shopkeepers to ask Parliament to put down Co-operative Stores is just as reasonable as though horsedealers should ask for the suppression of all shops which employed men instead of horses to carry out their goods. The less money is spent in the mere distribution of goods the better for society. Distributors add nothing to the wealth of the community. They are nothing more than a charge submitted to in consideration of the convenience which the payment of it secures. Nor can there be any doubt, except in the minds of shopkeepers driven to fury by the spectacle of successful co-operation, that the limits of this convenience have long ago been overstepped. Indeed in their calmer moments the shopkeepers themselves are quite willing to raise the complaint that there are too many of them. It is only the public by which these unnecessary dealers have to be supported that is not allowed to dispense with services which it does not think worth the cost. The writers of some of these letters might profitably employ their next holiday in counting the number of grocers or haberdashers in a single London street, and then considering how all of them can possibly live. If the question is honestly put, the answer must be that they cannot live except by charging exorbitant prices. Not that their prices are necessarily exorbitant if compared with their profits. It is the vice of having a superabundance of distributors that the public is fleeced to enable a number of unnecessary shopkeepers just to make two ends meet. If a thousand pounds of tea or a thousand yards of ribbon are to be sold, and there are three grocers or haberdashers instead of one to sell them, it is plain that the prices charged by the three must be higher than those which any one of them could afford to charge if he had no competitors.

It is this fact that enables large shops to undersell small ones. For it is not the Co-operative Stores only that are making war upon the retail tradesmen. They have foes in their own household. The number of large London shops which do business by correspondence in various parts of the country has greatly increased of late years, and it is plain that, assuming these to be driving a profitable trade in the first instance, the cost of thus extending it bears a very small proportion to the additional profits. In point of fact, many of the complaining shopkeepers are guilty of the very same offence which they charge against the Co-operative Stores. Those of them who live out of town are often to be seen carrying home a basket containing fish bought at a shop near Cannon Street or London Bridge. If they were told that in the suburb in which they live there is a struggling fishmonger who makes a poor livelihood by carrying fish round in a cart, they would say that by buying it at a large London shop they got it better and cheaper. And if they were further asked why they get it better and cheaper, they would answer that, in calculating his prices, the local fishmonger has to include the additional cost of distribution. If there were no other way of getting fish in this particular suburb the inhabitants would have to pay the higher price. But when the master of the house goes to London every day, and can bring fish home, this additional cost is a purely unnecessary cost. The case of the retail shopkeeper and the Stores is an exact parallel to this. The man who subscribes to a Store does not get what he wants at the neighbouring shop because the shopkeeper has to live, and because, where there are hundreds doing work which could very well be done by tens, he can only live by making his customers pay the cost of his livelihood in the shape of higher prices. If time is an object, it may be cheaper in the long run to pay these higher prices; but though time may be an object to the subscriber himself, it probably is no object to his wife. The care of the household stands to her in the place of a profession, and there is consequently no reason why she should not go to the Stores as often as she has to give an order. Besides this, orders

to tradesmen are largely given by letter. In theory, this way of buying may be less economical than ordering in person. But in practice, ordering in person has very much come to mean ordering in the person of the cook, which is not always an economical method. If a letter has to be written, distance makes little difference as regards the execution of the order. If the retail shopkeepers could possibly succeed in putting down Co-operative Stores, they would undoubtedly find that they had been benefiting a small minority of their own body. There would be joy in Mincing Lane, but things would be no better at Camberwell or Notting Hill.

The discussion in the daily newspapers has largely turned on the possibility of the retail shopkeepers making head against the competition of the Co-operative Stores. It is contended, on the one side, that, provided that they will lower their prices, give no credit, and be particular as to the quality of the articles they sell, tradesmen will naturally beat amateurs. People have wandered away to Co-operative Stores because the ordinary shopkeeper does not give a sufficient discount for ready money, and sometimes makes almost a favour of taking it; and because he is not always above selling adulterated goods. Let the shopkeeper mend his ways in these respects; let him refuse credit altogether, or at all events give the customer the full benefit of his prompt payment, and let him set his face against adulteration, and he will soon find that he can beat the Stores. On the other side, it is maintained that the conductors of a Co-operative Store can be content with just covering working expenses, because they derive their own incomes from other sources, whereas the tradesman has no other means of living, and must therefore make profit enough to keep his wife and family over and above the working expenses. Of course, if it is true that the number of distributors in England is altogether disproportionate to the real need for them, those who cheer the tradesman in this way are only doing him harm. Unpleasant truths do not become pleasanter by being kept back from those whom they concern. But, supposing the number of distributors to have been reduced within reasonable limits, this kind of consolation is perfectly in place. It is not true that the shareholders in a Co-operative Store are satisfied if the expenses of the Store are just covered. They always expect five per cent. for their money, and in some cases they have divided a good deal more. No doubt the shopkeeper may object that he cannot afford to be content with five per cent. on his capital, because, besides finding the money, he finds skill and supervision, and even actual work in the shop. This argument, however, leaves out of sight the fact that skill and supervision and actual work in the shop cannot be dispensed with in a Co-operative Store. Much of what the shopkeeper regards as profit is really payment for time, labour, and skill, and the only difference between the shop and the Store is that the purchase of time, labour, and skill is included among the working expenses. The conductors of a Store may only make five per cent. on their capital; but the reason why they need make no more is that, instead of themselves contributing the knowledge and industry required to make the concern prosper, they pay others to contribute it. The shopkeeper is spared this expense. Being himself an expert, he is the less obliged to employ experts, and the money which goes to pay this and similar items in the expenses of a Co-operative Store comes to the shopkeeper as profits over and above the interest on his capital. In reason, then, there is still abundance of room left for retail traders. If, instead of calling upon Parliament to work impossibilities on their behalf, they will frankly set themselves to give the public what they think they get at the Stores, the more energetic among them will certainly find that there is no want of customers capable of being tempted by the undoubtedly superior conveniences which shops have to offer.

EBB AND FLOW.

We have all been taught from our cradles that there is a tide in our affairs, and that it is our wisdom to take it at the flow. But we are not, in our youth at least, encouraged to look equally for the flowing of the tide in ourselves, or to take advantage of it. Doing things by fits and starts is severely discouraged by teachers. And very naturally; for it would be exceedingly inconvenient to them to have to wait for the rising tides of their pupils' inclinations, the laws of which would be harder to calculate than those by which any of the earth's waters rise and fall. But when we have become our own governors we are soon forced to recognize the fact that our nature is subject in almost all directions to fluctuations, more or less periodical, and not by any means easily controlled by the will. What we cannot control we must study, and make allowance for.

Temperaments seem to differ very widely in the degree in which they require intervals of intermission from labour. Not to speak of the familiar varieties of constitution with regard to sleep, there is no doubt a similar variety with regard to the power of continuing any one kind of effort for months or years. We have all heard accounts, which sound almost fabulous to ordinary minds, of writers of fiction who, as one novel is ended, begin another with no more ceremony than their neighbours make of taking a fresh sheet of paper. We see constantly before our eyes the manufacture of some kinds of intellectual tissue which proceeds as uninterruptedly as if by machinery. If the product in such cases is not generally of the very highest type, the facility of unintermitting production is almost as wonderful a thing in its way as the power of occasional soaring which belongs to a different order of minds. The minds which produce great works at long intervals may, however, possess, for aught we know, as great a power of continuous labour as those which turn out mental shoddy by the yard. Only the power is more complex; and if we may hazard a guess about such matters, we should suppose that its flow even when steadiest was likely to be composed, as it were, of many currents, which so give place to each other as to afford intervals of relaxation for each. In any great work of imagination, for instance, the creative effort must be much more rapid and transient than the labour of working out details, so that the imagination may fold its wings for a long rest while the hand is carrying out its orders. A highly-organized mind is like a great ship which pursues its appointed course without pause, though the officers sleep by turns. Smaller craft may have to lie to altogether while the fishermen take their rest.

Without attempting to judge how far the highest powers are likely to be intermittent, we will be content with the safer and more practical statement that powers which are naturally intermittent will not yield their best fruit if urged to too continuous exertion. There are few more delicate points to be observed in cultivating our own or our children's minds than the right allowance to be made for fluctuations of energy. We are right in discouraging capricious intermissions, but no sensible parent fails to provide sufficient intermissions of a regular kind. Later in life the question of how to deal with fluctuations becomes much more difficult, and not less important. Our powers fluctuate, and our feelings fluctuate, and not only in our affairs, but in our relations with each other, there are tides of which the ebb often fills us with unnecessary dismay. Much discouragement and misunderstanding might be prevented if the laws of these tides of the moral and intellectual world were better understood. A familiar instance, though some of us are loth to recognize its existence, is the fluctuating nature of most friendships. Such is the crudeness of our idea of constancy that many people fancy themselves guilty of some degree of unkindness if they find their appetite for some dear friend's society occasionally failing them. As reasonably might we blame our digestions for a similar failure of appetite recurring daily after dinner. The trouble is that in friendship the ebb-tides do not generally keep time on both shores; nor do they even occur with sufficient regularity to be announced beforehand. All that can be done by people whose disposition is markedly tidal is to recognize once for all the fact that their feelings will vary, and that such variations need not in the slightest degree depend upon any change in the source from which they spring, or even in their permanent average amount. Mere ebb and flow is a phenomenon which depends upon complicated relations with a system in which our own individual life, and therefore *à fortiori* our affection for any one person, is but a minute feature. Some people are much more open to these influences from the universe than others. It is idle to attempt to treat such susceptibility as matter for either praise or blame, though all susceptibilities doubtless call for the exercise of firm self-control, and call too often in vain.

People whose feelings are liable to wide and rapid oscillations have a troublesome task, not only in regulating them, but in giving any account of themselves. Those who are naturally given, not only to oscillation, but to introspection and self-expression, probably find much amusement in framing their reports of their experiences and laying them before the outer world. They may occasionally be troubled with twinges of misgiving as to the perfect compatibility of the various "sides of truth" which at different times they are called upon to exhibit. They are thus furnished with a key to many of the apparent inconsistencies of others, who, not being perhaps blessed with any great self-registering faculties, can do justice to their variations of feeling only by a series of contradictory utterances. Nothing is more comfortable in a fit of reaction against one's most cherished ties than to fall in with a friend who not only knows what it is to blow hot and cold, but has a cheerful conviction that an occasional change of partners in the dance of life brings refreshment to all concerned, and rather helps than hinders fidelity in the long run. In truth, it is for the sake of steadiness, of constancy, of perseverance in everything good, that we would encourage the giving free play to those variations of feeling which, like the tides, are really subject to laws as constant, and doubtless as beneficent, as those which produce cohesion. The mere use of these obvious metaphors reminds us that it is the same force of attraction which

keeps the stone in its place and draws the waters upwards in their season. It would be the height of presumption for us to fix the degree of fluidity which is allowable or desirable in human character. But to attempt to restrain a naturally fluid and fluctuating nature within the limits proper to a more rigid one is a mistake so easily made, so common, and so disastrous that we wonder that it is not more distinctly recognized by moralists. Somebody said it was a pity the devil should have all the best tunes, and surely it is a pity that the path downhill should have all the variety.

If our mental changes were, like the ebb and flow of the sea, only a perpetual alternation of different phases of almost equal beauty and interest, there would perhaps be little need to plead for their acceptance as inevitable. But our fluctuations distress and discourage us because unfortunately they are too often more like those of a tidal river, leaving bare unsightly margins on either side of the shrunken stream. Too often the stream of life and of activity seems not to change its place, but to contract its volume. We long not for a change of society, but for solitude. Our pleasure not only in one particular friend, but in friendship, seems to fail us. The objects of our endeavour and hope seem to dwindle in size or to move further off, and their hold upon us relaxes accordingly, leaving the burden of progress to press too heavily for our strength. It would be idle to pretend that there are not real, as well as apparent, failures of the very springs of life. The dwindling of our stream may be caused, not by a mere tidal fluctuation, but by the ebbing away of the fountain itself. All that can be said is that we ought never to be hasty, and that we are continually tempted to be hasty, in concluding that this is so. A mere lessening of power or of pleasure in any pursuit ought not to discourage us until we have given ourselves abundance of time for the ebb and flow to take place. It is one of the great advantages of experience that it enables us confidently to look for the return of the tide.

It may not be the case that steady powers are always, or even generally, of a lower order than those which are comparatively intermittent; but it must, we think, almost necessarily be the case that the most intense feeling comes only in waves. Human nature could not bear the strain of feeling at once very highly wrought and quite continuous. Most of us are familiar with the unexpected intervals of insensibility which come to relieve the pressure of acute sorrow. Grief which retained its hold of the mind without any such intermissions would, if severe, partake of the nature of madness; or, at any rate, would soon produce it. And either grief or joy, if intense, tends in most minds to bring about some degree of reaction. Religious biography abundantly shows how inevitably those natures which are capable of rising to heights of rapture sink back at intervals into corresponding depths of gloom. A moderate amount of self-knowledge leads people of this temperament to tremble at any unusual elevation of spirit, knowing well that it is the prelude to days of darkness. And the days of darkness are apt to last longer than the bright visions which usher them in. Perhaps also a certain natural instinct of self-preservation warns people of very emotional temperament to be on their guard against any violent fluctuations of feeling. Some degree of variation and intermission may be natural and wholesome, but instinctively we all feel that equanimity is a great good. It is only in so far as feeling can be made to yield a steady light that we can trust it as a guide for action. If it persists in fluctuating we must learn to strike an average for practical purposes.

Perhaps no human being is quite without tidal fluctuations of some kind, however they may be hidden under a uniform crust of manner and habits. We all admire the stubborn determination which pursues its course without regard to any failure of inclination; but some admiration is also due to the skill which makes every fluctuation serve its turn. Self-command is a fine thing, and so is versatility. It is useless to ignore the forces which we cannot control. And if there is danger and inconvenience in the fluctuations of feeling which belong to certain temperaments, it is undeniable that much of the picturesqueness of human nature depends upon its ebb and flow. People so self-controlled or so evenly balanced by nature that they always appear to be at a uniform level of feeling lose as much in impressiveness as does the Mediterranean sea for want of tides. They never rise to the pitch of eloquence either in words or action which belongs to the more impulsive type; and their even tenor leaves no room for the witchery of uncertain expectation by which some natures hold us spell-bound. As the dropping of water will wear away stones, so the rising and falling of spirits tends, up to a certain point, to deepen sympathy by repeated impressions. Beyond that point, it is true, it may wear it out.

THE PYRAMIDS REVISITED.

IT is only after repeated inspection that an adequate idea is obtained of the so-called Pyramid-field. Familiarity brings the most wonderful sights into their proper perspective. After a third or fourth visit, the bigness of the Pyramid of Shoofoo no longer weighs upon the mind, the height of the Pyramid of Chafra no longer overshadows it. The whole platform begins to assume its true aspect. It is the Kensal Green of Memphis. The traveller who comes to Egypt with a preformed theory about the Great Pyramid and its purpose, and who canters out from Cairo on a glaring day, is dragged up to the top, hustled through passages of the diameter of a gas-pipe, alternately exposed to the brightest sunshine and the blackest darkness, who is next hurried down across the hot sand to stare at the Sphinx, and finally chased through the dust by a yelling donkey-boy the long seven miles back to Cairo, supposes he has thoroughly "done" the whole thing. He fondly imagines that in all his after life he will be an authority on Pyramids, and will be capable in the home circle, if not in a wider sphere, of giving a valuable opinion on the theory of Mr. Taylor and Mr. Smyth. We need not be surprised if he pronounces strongly in its favour. The performance he has gone through is calculated alike to fatigue his body and confuse his mind. His attention has been wholly concentrated on the Great Pyramid. Its height, its rugged stones, the vociferations of the Arab guides, the giddiness which the steep slope or the sun's rays induced when he was on the summit, the broken shin acquired in the exploration of the interior, the temporary blindness after he came out, the grand chorus of backsheesh which signalized his departure, and a thousand other impressions equally vivid, mingle admirably with the ignorance or prejudice he brought out, and conduce to the formation of what he boasts is a cool and unwarped opinion. He has certainly seen something, superficially, of one Pyramid; but what did he see of the nine or ten which are near it, of the fifty-nine which are further off? He has not read, supposing he could read, a single hieroglyph. He has not the vaguest knowledge of early Egyptian history. He is perfectly certain that the world was created B.C. 4004, and believes that the odd four years were part of the original revelation. He has probably never heard of Justus Lepsius, certainly never of M. Lieblein. He is not acquainted with the name of a single Pyramid, and has no more knowledge of the table of Sakkara or the table of Abydus than of the Turin papyrus. He considers it best to keep his mind free and unfettered, and is all the more positive as to what he imagines he does know. The man who, after a personal visit to the cemetery of Ghizeh, can continue in the nurture and admonition of those who believe in the Sacred Cubit, the Time-passage theory, the meteorological theory, or any other tenet of the sect of which Mr. Smyth is presumably the prophet, must have been convinced on evidence very different from the evidence of the senses. We should be sorry to disturb a faith which is so wholly ethereal that it is independent of facts, and whose votaries are as much beyond the influence of argument as of plain proof.

Rightly understood, a Pyramid is neither more nor less than a cairn. It grew up from a cairn, and it was resolved into a cairn again. When it first emerges on the stage of history it is sufficiently rude and incomplete. If antiquaries are right in ascribing the Pyramid in steps at Sakkara to Ouenephes, a king of the first dynasty, this is by far the oldest building in the world; but, in spite of some recent assertions to the effect that his name has been found in it, the point is more than doubtful. Ouenephes lived at least as long before Shoofoo as William the Conqueror lived before Queen Anne. It is certainly recorded by Manetho that he built Pyramids; and, further, that they were situated at a place called Kochome, which M. Brugsch identifies with the northern part of the cemetery of Sakkara. Many heaps, more or less well defined, exist here, and any of them may be the Pyramids of Ouenephes as well as the Pyramid in steps. There is an irreconcilable discrepancy between the two passages of Manetho in which, under the name of Ouenephes, he speaks of the first Pyramids, and under Kaiechos, more than a century later, of the first setting-up of the sacred bulls, if this Pyramid was built, as has sometimes been supposed, for an Apis mausoleum. In fact it differs so much, with its four entrances, its thirty chambers, but chiefly in its not facing the points of the compass, from all the seventy Pyramids found here and elsewhere, that it must be looked upon as belonging to a wholly different class from the ordinary funeral monuments of kings. If the votaries of the Pyramid religion want a building which may perhaps not be a tomb, and which may have been built with a theological object, or as a record of faith for the benefit of posterity, let them turn to this remarkable and anomalous heap of stones. It will answer their purposes far better than one among a well-defined class of unquestionably sepulchral cairns. All the Pyramids except this one face the four cardinal points of the compass. All have but one entrance, and that on the north side. All contain provision for a single king's burial. Many are identified with the names of kings of whom it is recorded that they did build Pyramids in various places; and the Great Pyramid is, without any doubt which a reasonable man can entertain, the burial mound of one of a long line of kings who all erected similar mounds. In the lists it is not even distinguished by a name differing in character from the others. If we identify it, as we may very safely do, with Shoofoo, the second king of the fourth dynasty, and therefore the third king, possibly the fourth, who built a Pyramid or Pyramids, we find that it was only called the "Splendid," while to the Pyramid of Chafra is given the name of the "Great." To make more of it than a mausoleum, a royal "folly," involves making something at least of the Pyramids which succeeded it, and a great deal of those which preceded it. It happens to be the broadest, if not the highest, of those in the same group; it is by far the most conspicuous, owing to its situation on a corner of the plateau and in advance of its companions, so that the visitor from Cairo sees it before he sees any other. Travellers who have penetrated to the much more remote Maydoum report that the great building in stages which the Arabs name "Haram el Kedab" is even more imposing, no doubt

on account of its lonely situation and the absence of smaller monuments by which to measure it. Though it stands on no such elevated platform as that of Gheezeh, and though it rises but 122 feet above the heap of *débris* which surrounds it, yet it is only by actual measurement that one is convinced that it does not surpass, nay does not equal, in dimensions the Pyramid of Menkaura. The tomb of Shoofoo has, therefore, an adventitious advantage enjoyed by few of its neighbours in being the first we see, as well as really the largest. To this fact, almost as much as to its actual size, we must attribute the effect it produces on the minds of people who have never seen a Pyramid before. In truth, to the superficial observer it appears to hide all other Pyramids, and it is not until a second or third visit that he perceives that it is at present only a foot higher in actual masonry, and considerably lower in real height above the level of the river, than the adjoining Pyramid of Chafra. Had Chafra's Pyramid been at the edge of the platform, had it been the first seen by the visitor, and had the true relative proportions of the two been unknown, it may safely be questioned whether the Pyramid of Shoofoo would have become a subject of so much industrious, if futile, speculation. In the researches of early investigators this is very apparent. Champollion, for example, only examined one tomb in the whole necropolis, and Rosellini the same. All attention was engrossed by the monument of Shoofoo. It was reserved for Herr Lepsius to examine eighty tombs here, and to find the remains of no less than sixty-seven Pyramids.

The word "Pyramid" has been a matter of considerable questioning among antiquaries. A great authority derives it from the ancient Egyptian form *Abumer*, a great tomb, of which the Greeks transposed the syllables, just as they turned *Hor-em-Khoo*, the title of the Sphinx, into Armachis, and *Sestura* into Sesostris. This is more than plausible; but the name has also been derived from *Pi-Rama*, the mountain, and, as if to give Mr. Smyth the shadow of an excuse, from *puros*, wheat, and *metron*, a measure. So, too, *pur*, fire, and *puramis*, a pointed cake, have been suggested, and a hieroglyphic expression has been read, or attempted to be read, as *br—br*. We cannot so far, however, say for certain whether the Egyptians of the ancient Empire had any general name for such buildings, though every king's tomb had its own title, and in the picture writing a triangle represented, as determinative, all kinds of royal burial places, whether, like the grave of Unas, they were merely square platforms, or, like the southernmost monument at Dashoor, were almost dome-shaped. Upwards of twenty of these titles are found in the printed list of M. Lieblein, a Norwegian antiquary. They all betray the unbounded admiration in which each king held his own last resting place, and illustrate remarkably the real nature of the Egyptian faith in a life, not beyond, so much as actually in, the grave. Snoferoo called his Pyramid "the Crown"; that of Assekef is "Refreshment"; that of Pepi, the "Lovely Place," a name identical with the name of Memphis itself. Teta, perhaps playing on his own name, called his Pyramid *Tetsetu*, "the Most Abiding of Places." Others are the "Rising of the Soul," the "Most Holy Place," the "Good Rising," the "Beautiful," the "Great and Fair," the "Pure Place," the "Place of Rest"; while the monument, already mentioned, of Unas, which the Arabs call the Mastabat el Pharoon, is described as the "Best Place"; and the unidentified tomb of Noferkara as the "Abode of Life." Such are the evidences, among others, that to the men of that remote time—a time variously estimated as seven, six, and five thousand years ago—death was not looked upon with the horror which in later ages invested the grave with ideas of gloom, and recorded rather the despair of mourners than the rest of the departed. Near each Pyramid was the temple consecrated to the worship, or at least the honour, of the sleeping divinity of the Pharaoh. The foundations are still visible of such temples near the Pyramids of Chafra, Menkaura, and Raenuser. Even in the days of the Ptolemies the endowments which some of the oldest kings had conferred upon the priests of their shrines continued to enrich officials who after the lapse of some four thousand years perhaps enjoyed sinecures. In these temples, no doubt, once existed the name, and perhaps a record, of the glorious deeds of the monarch buried near; but, though the nameless tomb remains in so many cases, the temple has everywhere disappeared, and writings to which Manetho probably had access have been lost for ever. No inscriptions remain on any Pyramid. Herodotus tells us of the hieroglyphs on the Pyramid of Shoofoo. He curiously observes that they give the sum expended in supplying the workmen with onions and garlic; a statement from which we may hazard the conjecture, more than probable in itself, that the king's titles, as lord of Upper and Lower Egypt, were engraved with the lotus, the papyrus, and the bulbous plant, which in other places enter so largely into similar inscriptions.

Historically speaking, the Pyramids, apart from their antiquity, are of the highest interest. They represent a time of profound peace. They point to the existence of a dominant race, and of a race which could be called on for unlimited labour. They tell us little of the finer arts, in sculpture and painting, which even then flourished, but much of skill in engineering, quarrying, building as distinguished from architecture, and all that could be done by mere multitudes working together and bringing brute force to bear on stubborn materials. Whatever of higher art those early kings lavished on their "fair resting-places," whatever of portraiture and painting, of gold and jewels, of carving and ornament, of epitaphs and funeral odes they could command, were bestowed on the temple; the tomb itself was vast, solid, enduring, but nothing more. In the aftertime, when the kings of the twelfth dynasty fought against the Northern strangers, when Aahmes led his people against the Shepherds, when Seti I. subdued the Hittites and his grandson pursued Israel, when fortresses and treasure cities, Pi-Tum and Rameses, had to be built on the border, we no longer hear of such great cairns as the Pyramids. The tombs in the Valley of the Kings at Thebes, great as they are, required rather skilled labour than mere force. No vast multitude was needed to decorate them. The peaceful artist and his staff worked quietly in the dark corridors, while the people whose ancestors had heaped up the tombs of the older Pharaohs now followed the later Pharaohs to the battle-field. A smaller waste of human life than that by which Bonaparte ruined France would have built him a Pyramid greater than Shoofoo's. But the Pyramid-builders had neither enemies abroad nor rivals at home. A comparison of the different Pyramid-fields, and a little research into documentary evidence about them, bring out one fact very clearly in opposition to many recent theorists. The dynasties under which they were erected were successive, not contemporaneous. It was not as their rivals, but as their successors, that the kings of the fourth dynasty made their tombs beside those of the third, and the kings of the sixth dynasty beside those of the fifth. The last Mentuhotep of the eleventh dynasty was probably descended from Snoferoo, or possibly from Ouenephes, with as much directness as Queen Victoria from our Angevin Kings or the early Athelings of Wessex.

FANCY BALLS.

FANCY balls are institutions which probably owe their existence to the vanity of men and to the hideousness of men's modern dress. Mr. Darwin and others have proved that, among the less highly developed animals, the male is the more conceited, and has the gaudier coat. Even among those inhabitants of sunny islands who have not yet seen the need of clothing, the men are much more conscientiously and elaborately tattooed than the women, who have only a few decorative cuts about the corners of their mouths. The civilization of the nineteenth century has changed this, and the dress of man, especially the dress which he wears in the evening, causes him poignant but secret sorrow. He makes many feeble efforts to console himself, and in the gaudy cricketing and boating costumes of the clerk, the undergraduate, and the subaltern, the natural vanity and the crude barbaric taste of man may easily be recognized by the philosopher. It is a pleasant thing to go to the Lillie Bridge running grounds when the young gentlemen of some one of the monstrous shops are holding their yearly athletic contest. They gleam in bright blue; they flash past you on the rapid bicycle, in purple and green, before the eyes of their lady friends and of reporters. In the country, too, men can venture to be themselves. In *Lothair*, Lord Beaconsfield describes with sympathy and admiration the costumes of noble guests. They array themselves in velvet knickerbockers, with purple stockings, and scarlet neckties, fastened with rings of gold. Every one remembers the Persian apparatus, the Oriental magnificence of the dressing-gowns and smoking-coats worn by Guy Livingstone's men. They were alone by themselves in the smoking-room; for in those innocent old days, when Mr. Lawrence was thought a daring writer, ladies had not invaded that sacred place. Alone they were, yet they peacocked it and flaunted for their common delight in garments so fanciful and gay that it is a pleasure to read about them. A man thinks of them with inward comfort on a foggy day, when he is dressed in drab and black, as he thinks of some hours of sunshine, the gift of a departed summer.

What men would like is manifest enough; they would like to vie with women in colours and stuffs, in velvet and silk and cloth of gold. We flatter ourselves we could know what are the best sorts of lace if we gave our minds to it, and that the taste of men in this matter is not dead, but dormant. Oliver Goldsmith and La Fontaine, the most careless and not the cleanest of mortals, ruined themselves for peach-coloured coats and for Venice point. The loveliest dirty ruffles fell over those inky fingers of La Fontaine, and his dubious shirt had the most exquisite collar, which duchesses envied. Men are not degenerate; they are as vain as ever, as anxious to display their charms in what they think a proper setting. It is the way of the world and a commercial civilization that is against them. Lace ruffles would interfere with business; the mud and dust and smoke and soot of London would ruin the velvets and satins and the embroideries of silver. Men are compelled to wear the cloth of frieze instead of the cloth of gold; but they do not relish the necessity. Hence come Fancy Balls, which are mere luxuries to women, who, in a harlequin age of imitations, can wear almost any dress they please. If a lady likes, she may buy three stout pieces of merino, whirl herself into them, and appear in the costume of one of those maidens of Tanagra in Bœotia whose terra-cotta effigies are so beautiful and so expensive. The experiment perhaps has its risks, and nothing can exceed the anxiety of the spectators, who cannot imagine how the Tanagra dress is held together. The Dictionary of Classical Antiquities gives the vaguest directions; but feminine ingenuity can triumph over learned vagueness. A lady may dress in what she believes to be the manner of Watteau's models, or like a Princess in a fairy tale, or after the pre-Raffaellite manner of Mr. Rossetti's many Beatrices; in fact, if she is the spoiled child of clever eccentricity, she can do just as

she pleases. Her lord, unluckily, cannot well go to an ordinary dinner party in the becoming attire of the age of Edward IV. or in the kilt of a member of the Albanian League. Thus Fancy Balls are found by men to be a social necessity, and when once they have determined to dress themselves up, they of course do not know how to set about it. It is for them, we presume, far more than for women, that Mr. (or Mrs.) Ardern Holt has compiled a kind of dictionary of *Fancy Dresses Described* (the *Queen* Office), which the puzzled will find useful.

Perhaps there are not very many fresh and original costumes in the author's list, though the dress of a Stockbroker would excite remark on 'Change:—

STOCKBROKER.—Short pink silk skirt bordered with white satin, on which are printed the several kinds of stocks and gold coins; low bodice of pink silk, over it a low polonaise of star-spangled gauze, caught up with roses, the top of the bodice trimmed with gold coins and fringe; gold belt at the waist, gold net on the head with coins; a cornucopia carried in the hand, out of which stocks, money, and roses seem to spring; high-heeled pink shoes, black mittens.

When we have exhausted the Stockbroker, we find a good many pretty, but few novel, dresses for men. Arabs and Astrologers at once occur to the most ordinary mind. If a gentleman may appear as a Rat-catcher, with three dead rats slung on a stick, why should he not go as a Powwow or Choctaw magician, when he could adorn his person with a bear's head to cover his face, and with any number of defunct adders, asps, toads, and leeches? If you would be a Beast (in "Beauty and the Beast"), try "ruby velvet doublet, grey satin tights, ruby shoes, a leopard's skin, with claws attached to shoulder with jewels; small round ruby cap and feathers." If the Beast be so gracious, what must Beauty appear? No; to dress thus is to palter with nursery tales. The true model for the costume of a Beast should be sought in Catlin's work on the Red Indians, where there is a figure which would have the same sort of grisly success that Cholera once enjoyed at a masqued ball in Paris. Perhaps, however, Beasts, and even dead rats, would do well to abstain from attending fancy balls.

Bluebeard and Beefeater are decidedly commonplace. To go to a ball as the Earl of Bothwell (Mary Stuart's Bothwell) a guest must have no contemptible bodily presence. This is not a point about which people trouble themselves much, and the most ordinary young men will make-up as the Master of Ravenswood, or Aramis, or Richelieu, the conqueror of hearts, or the Duke of Buckingham, in his "slouch hat with plumes." Clowns, Christy Minstrels, and Cœur de Lion scarcely satisfy a "masker bold" who pines for novelty. A suit of chain-armour, too, is not well adapted to the movement of the dance, though it is interesting to learn that some people suppose Crusaders to have worn "helmets and mail coifs" at domestic entertainments. Darnley, David Garrick, and Débardeurs, with Fra Diavolo, and Dick Turpin in "high jack-boots" (how delightful it must be to dance in high jack-boots!) are not more novel than the characters whose names begin with C. Monks, postilions, and Sir Roger de Coverley mean monotony and routine. Literally there seem to be no new dresses for men, nothing at once fresh and suitable. The effective dress of the old German students described in *Spiridion* might be recommended. Men must shoulder their three dead rats, pull on their jack-boots, powder their wigs, wear "black shirts and white coats," "don" their coifs of mail, and make the best of a bad business. It is hard on them, and rather hard on their partners. Singular to say, though fancy balls exist for the sake of men, as we have shown, there are about twelve possible dresses for ladies to one possible dress for gentlemen. "Among the costumes best suited to BRUNES," we read, "are Africa, Arab Lady, Arrah-na-Pogue, Asia, Autumn, Bee, the Bride of Abydos, Diana, Druidess, Cleopatra," and so forth. We might have fancied that Africa was rather suited to a *noire* than a *brune*, but of course there are degrees of brownness. A mulatto girl might do Africa pretty well at a pinch. But consider the injustice of the whole arrangement. There are no male counterparts to these female characters. The attire of Cleopatra is described, but not that of Mark Antony. We have the details of the dress of the Bride of Abydos, but nothing is said about the young married man of that city or district. There is a Druidess, who is specially warned to wear "no tucker," a very necessary precaution. We do not think of Druidesses in tuckers. But there is no description of the costume of a Druid, which, in pictures, chiefly consists of a white beard and a sickle. We have Penelope, but not Odysseus, only Obadiahs (two). This is an absurd omission, as we happen to know precisely what the hero wore, whereas our information about Penelope is limited to a minute account of her necklace and earrings.

The general rule for ladies' dress is, "There is safety in tulle." "Air" is "to be carried out in white tulle, tarlatan, or gauze," and of the two Babes in the Wood, the girl, rather thoughtlessly, "wears an evening dress of white or green tulle." Aurora appears in the same accommodating material. Aurora, of course, without Tithonus, a capital character for an elderly man. Diana, if she would be classical, has to wear a "white cashmere skirt, and a loose low bodice." Nothing is said about the length of the skirt, which the goddess wore uncommonly short. The public, like Mr. Potts in *Pickwick*, "won't stand the tunic." As far as we understand the directions for the dress of an ancient Greek lady, that character must present herself in the very simplest and most elementary attire. The *chitonion* which she is told to wear may be a "Greek scarf," but Liddell and Scott think it was "a shirt, worn under the ordinary chiton." Probably neither Liddell nor Scott really applied their minds to the practical question. Perhaps the most curious character is that of the "Musée de la Poésie." Most ladies would as soon think of dressing as the National Gallery or the British Museum. We do not recommend a gentleman, even if he can provide himself with a Man Friday, to go to a dance as Robinson Crusoe. He has to carry too much weight—namely, "green parrot on shoulder, fowling-piece, pistols, hatchet, and umbrella." Is it not almost ridiculous to suppose that, if Crusoe had taken part in a "corroboree" of friendly natives (the only form of dissipation within his reach) he would have jigged with a hatchet, umbrella, and fowling-piece in his hands? We should think of the fitness of things when we go to a ball, and not handicap ourselves quite out of the slowest of quadrilles by carrying a small armoury. The best chance for a man seems to be to wear the costume of the *incroyables*, or of Watteau's date, and to give up the hope of seeming an historical character. If he must give himself a name, Eugène Beauharnais, or the chevalier who loved Manon Lescaut, will serve his turn. Ladies are, not wisely, of opinion that their sex, or the other, wore the same costume under Louis XV. as under Louis XIV. The dress of the earlier years of the Grand Monarque was far more simple and beautiful than that of the later reign. When all is said, ladies will find it difficult to avoid looking well, while men need to take great pains to shun silliness, anachronisms, jack-boots, and two-handed swords.

THE BIRMINGHAM FREE LIBRARY.

THE public Library at Birmingham, the most precious contents of which were burnt last Saturday, stands in the middle of the town, opposite to the new College—now nearly finished—on one side, and to the noble Town-hall on another. The group of buildings to which it belongs are among the few in Birmingham that possess any architectural merit, and form a grateful relief to the dingy monotony by which the town, like most of our other great seats of industry, is characterized. The regret with which all lovers of books will have read of the loss of a collection in several respects unique may be tempered to some extent by the consideration that a still wider calamity, the destruction of the adjoining buildings as well, has been avoided. At one time, indeed, in the course of the fire, the new College was threatened, but the danger happily passed away. However, consolations of this kind are rather such as comfort the minds of well-wishing bystanders than tend to soothe the pain of those who are smarting under a personal misfortune. It is greatly to the credit of the town that this public loss should be felt so keenly as a personal one. Of all the public institutions in Birmingham, the Library was the one most prized and vaunted. No reasonable expense has been spared to make it as complete as possible. Books have been not merely amassed, but selected with great care and discrimination. Though their number has been largely increased by private generosity, still the library has been paid for mainly, and the building entirely, out of the local rates. Week-days and Sundays alike it has been open to all, rich and poor, and has been freely used by all classes. It was one of the sights of the town which all strangers were taken to see. It was pointed to with pride as evidence that manufacturers and artisans can care for mental culture. The little room in which the Shakspeare collection stood was regarded as a sort of shrine. But, though the building will be made as good as new, and the main part of the books will in due time be replaced, many are burnt that no money can now buy. The Shakspeare library, the Staunton collection, and the Cervantes library—collections unique in their several ways, and which were felt to confer a literary distinction upon the town—have perished in the flames.

The Library was divided into two departments—the Lending Library and the Reference Library—the former of which was opened in the autumn of 1865, and the latter a year afterwards. In the Reference Library the number of books in the year 1867 amounted to over 18,000, and the issues to readers for the same year were above 44,000. In the year 1877 the number of volumes had risen to 44,500, not including 4,000 volumes of patent specifications, and the issues to readers amounted to 281,000. In other words, not only had the number of books been multiplied two and a half times in the course of ten years, but this increased number was used more than twice as much as when the Library was founded. Though the returns for last year have not been published, it is probable that at the time of the fire the Reference Library contained 48,000 volumes. The issues from the Lending Library in the year 1877 amounted to over 187,000, making a total of issues from the two of more than 468,000—an average of considerably more than a volume for every inhabitant of the borough. When one reflects how seldom an artisan can possibly have any library, however small, of his own, the good done by such an institution appears incalculable. The bulk of the readers are young men under thirty-five years of age (the age of each applicant is inserted in the form of application for books), in other words, men whose tastes have been formed by the Library. The older men, whose tastes were fixed before it was founded, are more scantily represented. The books were chosen for the Library with excellent judgment, and, apart from the special collections, included many valuable works which even persons with good private libraries of their own were glad to consult. But the reputation of the Library outside the town itself rested on the three specialties above mentioned.

The Shakspeare Memorial Library contained nearly seven thousand volumes, including 336 complete English editions, 17 complete French editions, 58 in German, 3 in Danish, 1 in Dutch, 1 in Bohemian, 3 in Italian, 4 in Polish, 2 in Russian, 1 in Spanish, 1 in Swedish, besides separate plays in Frisian, Icelandic, Hebrew, Greek, Servian, Wallachian, Welsh, and Tamil. Besides all this, there was a large mass of literature in many languages bearing on Shakspeare. It is to be hoped that some at least of these treasures may be found in a tolerable state among the ruins, but so far the fragments saved have been few. The Cervantes Collection is gone too. Nearly all the editions and translations of Don Quixote and the other works of Cervantes, many of them exceedingly rare, and most of them in the best condition, the gift of a gentleman, Mr. William Bragge, who had made the collection a principal aim of his life, were stored in the same building and have shared the same fate. And the Staunton Warwickshire Collection, the combined work of various antiquaries of the district in past and present times—which contained, in addition to a large number of books to be found elsewhere, a great quantity of original manuscripts, and of drawings and engravings of which no other copies are known—leaves behind it a gap which can never be filled up. One relic only—the manuscript record of the Gilde of St. Anne at Knowle—appears to have been saved. The loss in these special departments is of course irreparable. In the general branches of literature there is no doubt that the energy and public spirit in which the town has never been wanting will in a couple of years make the library all that it was a week ago; and the recent disaster will probably have at least the good result of causing the more valuable treasures of the collection to be more jealously guarded in the future.

It was at first reported that the steam fire-engine did not arrive till more than half an hour after it had been summoned, and that, when it did come, it was for some time useless, owing to the water-mains being frozen. It is satisfactory to learn that this is not the case. The steam-engine came as soon as it was sent for, and found plenty of water to pump up. But it appears nevertheless from the local papers that it was not sent for at all till nearly half an hour after the fire had broken out, "and not until the men of the brigade found that the fire was of such serious magnitude that they could not successfully combat it with the stand-pipes." Had the disaster, which arose from a wood-shaving catching fire as a gas-worker was thawing the frozen pipes, been dealt with at once, it would have been a simple matter enough. Fourteen persons were reading in the library when the smoke was first perceived, and a single bucket of water, we are told, would have then sufficed to put it out. It seems that a number of buckets were hanging up in the passage, but they were too high to be reached, and were only at last got at by hoisting a man up on the shoulder of another. And by the time the buckets had been handed down, and a tub of water found, the flames had gone too far. But it still remains unexplained why, when the chief treasure of the town was on fire, none but hand-engines were used for half an hour. That people should trifle in this way with a perilous conflagration, and see with how small an expenditure of water and labour it can be got under, seems inconceivable. It is the way to get a whole city burned down. Possibly some explanation may be forthcoming. An explanation is certainly needed. Imagine the National Gallery on fire, three or four hand-engines sent for, and the firemen waiting till they were fully satisfied by experiment that the flames were too strong for them before the steam extinguishers were brought on the scene. It will add not a little to the regret caused by the calamity if it should prove that it was not stopped at the outset only for want of a little common-sense and self-possession. Is it possible that Birmingham, Mr. Chamberlain's Birmingham, the Birmingham of the intelligent working-man, is the victim of red-tape and "How not to do it"?

Only those who are familiar with the curious local patriotism which distinguishes Birmingham can understand the intensity of the grief which this misfortune has called forth. The same public spirit which created the lost library will no doubt replace it on more than the old handsome scale. The building will be restored. All the standard works will be seen again on the shelves. Other special collections will take the place of those which are gone. But to many of the inhabitants of the town the disaster will be a personal trouble which they will never forget. No man of scholarly tastes can help respecting this feeling, and wishing that the new Library may be watched over by a kinder fate than that which attended the old.

SNOW-DRIFTS AND THAWS.

When dwellers in the mild latitudes of the Land's End are grumbling at "the hardest winter they have ever known," and marvelling at the phenomenon of Michael's Mount enveloped in a shroud of snow, it is no wonder that the inhabitants of the Northern parts of these islands are having an unusually severe time of it. Use goes for a great deal, no doubt; and it is nothing unusual for the latter to be lost to sight, though they may be left dear to memory, for a brief space in the course of the winter. But during the present season even their well-proved patience must have been sorely taxed; and those of us in the South who are happy enough to have food and fires, sufficient clothing and a solid roof-tree, have good reason to raise our voices in gratitude and thank Providence that we are not as many of our neighbours. Snow is pretty sure to be pronounced a nuisance by any one who has passed the age for snowballing and ceased to find an agreeable excitement in discomfort. When you say that on a bright sunshiny day its unsullied purity lends lustrous picturesqueness to the wintry landscape, you have said the very utmost that can be urged, even from the poetic point of view. And we suspect that the poetic soul itself prefers, on the whole, to contemplate the spectacle from the windows of a well-warmed apartment. There is pleasure in a brisk walk in a bright, though biting, frost, when you have firm foothold on the iron ground, though it may leave something to desire in the matter of elasticity. But snow is at the best treacherous and irritating. If the day is dull and raw, any sort of exercise is an aggravated effort; while, if the sun is cheerful and has any power, the snowy surface is in a state of smudgy solution. You slip painfully when going up hill; you slip perpetually and more dangerously in going down; and even stumbling about on the level is a heavy trial to the back sinews. Then snow-water is proverbially insidious. Even if you are, as a rule, absolutely indifferent to damp feet, still there is a very sensible discomfort in the insinuating rawness that seems to penetrate between the thickest sole and the toughest porpoise-leather; and, unless the country is in such a condition as to make sledging enjoyable, you are worse off in a carriage or on horseback than on foot. For, after all has been done in the way of "roughing," there is always a chance of the most sure-footed animal coming to grief; and at best, when the snow is balling beneath his hoofs, he may slip and strain himself awkwardly or dangerously. In fact, the only people who, as we believe, welcome a snowfall are the writers of our Christmas literature and their admirers. By the more prosaic world in town or country, it is only endured with more or less of resignation.

Yet, after all, to us in the South snow is seldom or never anything worse than a nuisance. In the North it may be nothing short of a calamity, and not unfrequently it may be even ruinous in its consequences. We do not know that there is much heavy mercantile business transacted at John-o'-Groat's House, but Caithness is a flourishing county in its way, and we hear of the unfortunate dwellers there being cut off from the world for thirteen consecutive days. Imagine what it must be to have no letters or newspapers for thirteen days, and doubtless the telegraphic communications broken. In these anxious and agitated times, when we are daily hearing of failures and panics, a tradesman or banker might be brought to a bad way indeed if his credit chanced to be impeached when he had no means of correspondence. It is to be hoped that, knowing what is possibly on the cards, prudent men of business take all due precautions in consequence. But with the inhabitants of isolated country houses, with the lonely farmers and the solitary shepherds, the most far-sighted precautions can only mitigate the misfortunes which they have to expect. It strikes us that in some ways they are even less favoured than the natives of Labrador. For the Esquimaux are at any rate always prepared for the worst, and indeed "the worst" is with them but the regular dispensation of their deities. They secure their sledges and kayaks, and, having laid in their winter supplies and established permanent communications with their storehouses, they burrow in their hovels through the long winter night, luxuriating in a paradise of blubber and train-oil. The snow may fall or drift; a foot or two more or less is not of the slightest consequence, save in so far as it may raise the temperature within doors. There is no danger of their being reduced to short commons, and they have no property exposed that can possibly suffer. With the Scotch moorland farmer things are very different. The sky has been growing murkier and more lowering through the darkening afternoon, till the "lift," as he would say, seems to be lying on the hillside. Though there seems to be no wind to speak of, there is a sighing and a moaning among the leafless boughs; and, though his heart be stout enough, still it is inclined to sink when he turns his eyes upon the falling weather-glass. Towards dusk he has fresh cause for his fears. The great white flakes come feathering thickly downwards, settling silently on the windward side of each outstack and gable-end about his premises. As he takes his last turn round his folds and "byres" before retiring for the night, the nip of the rising blast makes him draw his plaid more tightly round him. Well as he knows his way about, he has to grope in a grey darkness that may be felt; nor can he see his hand before him when he stretches it out to undo a latch. Probably he has a quiet conscience and a good digestion, and so may sleep soundly in spite of his cares. But in the morning, when he has risen long before the late dawn, he pays but small attention to his toilet before making his way to the door. Above and beneath is darkness visible; but it does not need the shower of snowflakes that the draught drives in his face to confirm his worst prognostications as to the prospects of the weather. For a bank of snow already a couple of feet high has been heaped across the threshold of his doorway. As soon as there is the first faint glimmering of dawn, he kicks his way through the yielding barrier and plunges knee deep across the yard. The snow is coming down as densely as ever, and likely enough to continue to come down for a day or two. Yet already it has been drifting everywhere, coiling itself in twisted wreaths behind the dikes, and piling itself over the pigstyes and about the low entrances to the cattle-sheds. It gives him no great concern to know that his communications with the nearest villages are being stopped. His little garrison is fairly well victualled for a long blockade, and there is no risk whatever of starvation. But he shakes his head sadly as he thinks of the sheep on the moors.

Meanwhile, though the storm may be only beginning, there is work to be done by active arms. Passages must be cut from the house to the various outbuildings, and those passages must be kept open by incessant shovelling, while the snow-plough is pushed along the neighbouring road. Of course the snow walls on either side rise higher and higher, while the drift is ceaselessly heaping up hillocks all around, till the usually level surface of the farmyard begins to look like a miniature Savoy, which promises in the day of the inevitable thaw to be turned into a country of rivulets and cascades. Notwithstanding the wild drift and snowfall, the farmer's first care is to make his way to the hill to seek an interview with his shepherd and hear some news of the flock. Though he may have been born or brought up from a boy on "the land," he will be sorely put to it to find the well-known road. It is all pretty straight steering, so long as the road runs between the dikes; though every now and again he may step aside into the ditch, and find himself floundering up to the middle in the snow wreaths. But out on the open moor it is a very different thing. The air is so thick with blinding drift that all but the nearest outlines are absolutely effaced. What he can distinguish immediately around him is a scene of desolation and utter confusion, where the familiar inequalities have been smoothed away and the hollows filled up. It is vain to try to guide himself by feeling the air upon his cheek; for the wind twists at all times in those upland glens, and now it seems to be whirling the snow about in a multitude of tiny cyclones. If the master is to hit off his shepherd's shealing, it must be by his intimate acquaintance with the hill slopes and the watershed. And, when they do come together, both master and man wear very rueful faces, nor has either of them much consolation for the other. Such of the sheep as are not in the pens must shift for themselves as best they can, and what may be the ultimate fate of the flocks must depend chiefly on the duration of the tempest, and a good deal on the lie of the ground. It is wonderful how instinct will often serve and save them. Doubtless they were aware of the coming storm some time before their anxious proprietor, and had shifted away instinctively to the shelter of the glens and the corries. But if there should be little broken ground on the grazing, they can do nothing but huddle themselves together on the least exposed of the slopes; and in any case, if the snow gets heaped higher and higher, they may find it impossible to shape their way to the herbage or the heather. Then, when the long-looked-for thaw has come at last, dismal discoveries may be made; and though "braxy" (the mutton of sheep that have died in place of being slaughtered) may be plentiful enough in the larder of his cottage, that will hardly comfort the shepherd for losses which may possibly have gone far towards ruining his master. The hill-farmer, however, has seen the worst of it when the thaw sets in, though even he looks out from his windows like Noah from the ark, on the waste of muddy water that has submerged the "haughs" by the stream. But with the melting of the snow comes the turn of the dwellers in the valleys, who see the rivers swelling and overflowing their banks, spreading destruction all round, and leaving stagnant lakes behind them when they have receded. If we were given a choice of plagues, we might perhaps be inclined to vote for the floods, and yet these are apt to bring diseases in their train, which the hill people escape in the most terrible snowstorms. Destruction of one's stock may be thought preferable, on the whole, to mortality or sickness in the family.

THE BEACONSFIELD, BRIGHT, AND GLADSTONE CARTOONS.

THE Professor at the Breakfast-table says that each of us contains three persons. There is the real man, as he is known only to his Maker; there is the man's ideal self, as it appears to him; and there is the self as conceived of by his neighbours. The cartoons from *Punch* in which the careers of three statesmen are illustrated display the third—the conventional—view of Lord Beaconsfield, Mr. Gladstone, and Mr. John Bright. It is the business of *Punch* to see these politicians, not as partisans see them, but as the British public regards them in its *mollia tempora*, in those genial hours when it lets its vexed consciousness play freely. If *Punch* were a partisan print, each of these distinguished persons would in turn have been drawn with horns and a tail. Mr. Gladstone, to a very large and respectable section of his fellow-countrymen, has long seemed no better than an unchained power of evil, "a wind," to quote a prolific Scotch poet, "that shrieks on the waste places of the Lord," and that shrieks disloyal, traitorous, unconstitutional, unpatriotic, cosmopolitan nonsense. As to Lord Beaconsfield, we know that Mephistopheles is the mildest term of reproach which many Dissenting ministers can find for him; while Mr. Bright was at one time regarded as a kind of cross between the hypocrite and the blatant demagogue, as a man at once smug and boisterous, at once canting and revolutionary. These are, or were, the judgments of angry partisans; and we are not certain that faint refractions of these fanciful shapes have not now and then been reflected in the cartoons of *Punch*. Mr. Bright was certainly designed as a "wind-bag" and foil to the silent wisdom of Mr. Carlyle. The fiercer cartoons have not been reprinted in the collections now republished, though some of the unkinder cuts at the Mr. Disraeli of the past have been retained.

Speaking generally, on the testimony of these cartoons, we may say that the English people have from the beginning suspected, liked, and laughed with Lord Beaconsfield; have respected, disliked, and doubted Mr. Gladstone; and have found it difficult to make up their minds about Mr. Bright. About Mr. Disraeli one thing alone was from the first absolutely certain. He was not dull. In the waste of Parliamentary dulness, in the "Babel of our sterile politics," one voice was sure to be heard that was clear and trenchant, *vox clamantis in deserto*. Hence the sympathy of *Punch*—which aims at being the perfect representative of the absolutely ordinary mind in its lighter moods—with Mr. Disraeli. He may be drawn as a faded ballet-dancer, with a superannuated smile; as a rouged and sardonic Peri, at last admitted to Paradise; as a Cheap Jack at a fair; as a serpent, gnawing that respectable old file Sir Robert Peel; as a sham country gentleman in boots, hat, and broadcloth coat from Nathan's; and yet the laugh and the sympathy are with him. Thus, in an early picture of the Gladstone series, John Bull is entrusting his carpet-bag (labelled Budget) to a sour, small boy, with the features of Mr. Gladstone, while he refuses to have anything to say to Mr. Disraeli, a merry, roguish little crossing-sweeper. Here the favoured Mr. Gladstone has the squint of the bitterest religious hatred. You feel that he will put the shilling he receives from Mr. Bull in the savings-bank, and you fear that he will end a career of pious respectability as a fraudulent and exposed director of a bank. The grinning boy with the brush is equally certain to drop the bag in the mud and to lose his shilling at pitch-and-toss and not to care. The balance of the nature of Englishmen leans heavily towards stupidity and respectability. Hence, by way of reaction, the national sympathy with characters that are clever, and not overburdened with the sense of responsibility, or duty, or anything else. The great heart of the people is on the side of Mr. Disraeli when, as Topsy (1852), he breaks the windows, throws open the cupboards, dances on the measures of his party, and "specs nobody can do nothing with him." In the admirable vignette on the frontispiece of the Gladstone series Mr. Sambourne has illustrated the last stage of the long opposition between solemn earnestness and satiric earnestness. Mr. Gladstone is tearing his hair and thundering invective from a pulpit shaped in the likeness of the clock-tower of St. Stephen's, while Lord Beaconsfield is sitting smiling below, and tickling the orator with a long curly feather.

The general sympathy has been, on the whole, against Mr. Gladstone, not because he is earnest, but because he has always put his earnestness forward. The world has always recognized, not without pleasure, the earnestness which Mr. Disraeli avowed from the first in a manner at once frank and ironical. He was clearly quite as determined as Mr. Gladstone, but then he was determined to have his own way, and what that way was he declared almost as openly as Prince Bismarck could do. In spite of the "mysteries" and "surprises" of which his opponents have talked a good deal, the secret of this Sphinx has always been so far an open secret. People have been captivated in spite of themselves by the clear-sighted resolve, by the gay courage, by the knowledge that a plan was being worked out from first to last, by the indifference to discomfiture which marked Mr. Disraeli. They have disapproved, they have stormed, scolded, preached, and ended by laughing, forgiving, and even—forgetting. The old assailants, the Catos of Conservatism, are indignant when their ancient woes and those pranks which so outraged them are recalled by the viperous Radical. Meanwhile the puzzled public, which the cartoons so often represent as hesitating between the attractions of seriousness and mirth, has decided to take part with the latter, and with success. Looking at these designs, one sees how Mr. Disraeli's career has increased the democratic tendency to look at politics ὥσπερ θεαταὶ ἐν ἀγῶνι, like spectators at a play, where the applause is given and the crowns are thrown to the cleverest mime. It is rarely that the educator of his party is so hardly used as in the cartoon in which he plays the part of Fagin at the thief's school, and shows his young friends how to pilfer Liberal measures. His last appearance is in a *Scène de Triomphe*, where he wears the garter and laughs at his luck, at the spectators, and at his grave and decorated companion.

The Gladstone cartoons begin in 1855, ten years later than the earliest drawing of Mr. Disraeli as "young Gulliver" (young Gulliver was in his fortieth year) "and the Brobdingnag Ministry." Mr. Gladstone first appears, not as a small but courageous creature, undaunted by the great, but as a footman who "wishes to leave at once." With Sir James Graham and Sidney Herbert, Mr. Gladstone "seceded from Lord Palmerston's Cabinet in disapproval of the demand for an inquiry into the Crimean mismanagement." This was not a very popular line; and, on the whole, these drawings rarely display Mr. Gladstone as a truly popular character. He may be successful, but, even as "the boy for our money," he is not amiable. Even when he "takes a penny from the Income-tax" (1861), he appears as a dentist who has made his patient cry. Mr. Disraeli, on the other hand, would have been facetiously represented as extracting the money by the "confidence," or other trick, from a puzzled but pleased John Bull. When Mr. Gladstone is represented as a jockey, he is too good a starter, and is off before the fall of the flag. His supreme feat is to present Mr. and Mrs. Bull with a packet of tea. As a manager, he is jealous of his company, and says, "Mind, no starring in the provinces." The beginning of the end of a career of stormy successes is indicated in the cartoon which shows the

Ghost of Lord Palmerston remonstrating with Mr. Gladstone for "his pacific attitude on the high-handed abrogation by Russia of the Black Sea clauses of the Treaty of Paris." Through the whole set of cartoons Mr. Gladstone has only twice a smile on his face. We miss the admirable drawing of the peaceful peasant and the dissembling earl, and the sketch of Mr. Gladstone's failure to clear the Irish stone wall.

Punch has always taken the same view of Mr. Disraeli and Mr. Gladstone. Mr. Bright is apparently a more difficult subject. At first he is a smug Quaker bagman, who tries to make a convert of the Duke of Wellington. He and Mr. Cobden give the Czar Nicholas a toy Turk to pull to pieces, though Mr. Bright appears to be remonstrating a little with his passionate and imperial friend. He lights the fire under the kettle of Reform, and "hopes it will soon boil," and he laboriously climbs the greasy pole of popularity for the reward of the leg of mutton. His strength is recognized (1858) in a design which represents him in the act of knocking down a number of timid Liberals who do not go far enough to please him. His timidity, the timidity of an employer of labour and a capitalist, is illustrated (1866) in a very humorous cartoon. Walking under the shadow of a gigantic "proletarian," Mr. Bright says, with every sign of alarm, "I have no fe-fe-fear of ma-manhood suffrage!" His logic (1863) is, that "the masses of the people are so illiterate that sound statesmanship requires that they shall be admitted to political power." The funniest of all the cartoons represents him as a stout, middle-aged lady, in all the conscious and sulky dignity of "a political wall-flower." In many cartoons he is violent, in some he assumes the command, while he is only a lieutenant. His buxom content with himself in his court-dress regains for him the public favour. People only laugh when, as a lacquey, he forgets his place, loses his temper, and bids the coachman of the Upper House, "Pull out of the way there with that infatuated old machine of yours, can't yer?" Mr. Bright, after all, seems somehow the most human of these distinguished characters. He is neither too awfully virtuous nor too whimsically clever; neither a mixture of Puck and Ariel on the one side, nor a compound of Tartufe and "Roland the Just" on the other. It is easy to guess what he will do and say, what he will like and dislike; though he will do everything "with the strength of ten," and will be inconsistent with a splendid honesty of unconsciousness which is one of his most human and pleasing characteristics.

The technical merits of these caricatures need hardly be discussed. Mr. Tenniel naturally shows himself as the supreme political caricaturist, while Mr. Leech and, still more, Mr. Doyle had, as manifestly, their true province elsewhere—in social and in fantastic art.

MORE ABOUT ALCOHOL.

WE are not aware whether it is intended to continue any further the discussion respecting alcohol which has been carried on in three numbers of the *Contemporary Review*; but it certainly does not appear that anything will be gained by doing so, for the question which was raised seems now to be decided so far as such a question can be decided. There is, it is true, some difference of opinion respecting it amongst experts, but unanimity could hardly be expected in a matter of so much difficulty; and that the opinions of the majority have been the best supported there can be little doubt. The first contribution on the subject was, as will be remembered, by Sir James Paget, whose lucid arguments in favour of the moderate consumption of alcohol as against total abstinence have certainly not been refuted. He was followed by several physicians, two of whom held views similar to his, while two were opposed to alcohol, and others spoke with so vague an utterance as to make it impossible to predicate anything positively of their opinions. In the last issue of the *Review* are articles by five well-known medical men, who, though differing on some points, all appear to look with favour on temperance—*i.e.* strictly moderate wine-drinking—as against total abstinence. The preponderance of opinion is therefore on one side, and it may fairly be said that the best arguments are brought forward on that side; so that, unless there is to be interminable contention on the subject, the cause of those who think that wine is good for man may be held to have triumphed. It must not be thought, however, that the very smallest encouragement is given to self-indulgence. There is an important qualification to the victory, for it seems clear that the temperance which physicians advocate requires, in many cases, more real self-control than total abstinence.

Before, however, we consider what temperance really is, it is necessary to point out what are the views held by the doctors who have most recently written on this subject. Their remarks, it should be said, apply only to men who have work to do, and who feel the constant pressure of modern life; and some of them are less decidedly in favour of wine—under which word, to avoid verbiage, we include all kinds of alcoholic liquors—than others. Thus Dr. Risdon Bennett would apparently only allow wine to persons who are past middle life; and Dr. Kidd thinks it necessary only for those who are not in perfect health. The latter, however, adds that "in the ordinary wear and tear of civilization" few people can be called perfectly healthy; and, on the whole, both doctors appear to take a favourable view of the effects of small quantities of alcohol. More decided are the opinions of Dr. Garrod, a very great authority on the disease commonly supposed to be specially due to wine, and of Dr. Radcliffe, a very great authority on diseases of the nervous system. The first lays down as an absolute axiom that "the majority of adults can take alcohol in some form or other, not only with impunity, but often with advantage"; and says emphatically that "as yet there are no trustworthy statistics to show that abstinence from the moderate use of alcohol is attended with unusual length of life or improvement in health." The second, whose contribution consists of an account of a conversation in which he argued a patient out of a belief in total abstinence, states "that alcohol, when properly used, is, what it is abundantly proved to be, a natural and potent means of comfort." Dr. Brudenell Carter, the other physician who has contributed to the last number of the *Contemporary Review*, says:—"We may assure ourselves by common observation that the moderate consumption of alcohol is useful to many persons, and that it does not produce, at least necessarily, or in any but exceptional cases, the dire effects which have been ascribed to it."

These certainly are definite views, and in support of them the results of much observation and experience are given, to which unfortunately we can only very briefly refer. One of the most important facts adduced is that to which attention is drawn by Dr. Radcliffe, who points out that "alcohol properly used is of great service, partly in keeping up the animal heat, by supplying easily kindled *fuel* to the respiratory fire, partly in producing nerve power by furnishing easily assimilable *food* to the nerve tissue, and partly in *lessening the necessity for ordinary food by diminishing the waste of the system* which has to be repaired by food." The italics are Dr. Radcliffe's, and he goes on to show how a man of hearty appetite who is a water-drinker may very likely habitually eat such quantities of food as ultimately to injure his digestion. Wine will be invaluable to him because, in consequence of taking it, he will require less food, and because the wine itself will, by supplying fuel and food in the manner just described, "augment vital warmth and nerve power, and in that way promote the activity of digestion and assimilation, and every other vital function." It is an obvious inference that such a man would have been better if he had always drunk wine. Dr. Radcliffe's views are shared by Dr. Brudenell Carter, who states that total abstainers are generally very large eaters; and that, in particular, they have an especial craving for sugar; and it need hardly be said that, of persons who live in cities, few can continue for long to eat very largely and to take a considerable proportion of sugar in their food. The digestion almost inevitably fails. Here, then, is a very tangible fact in favour of wine, and other valuable evidence, which want of space does not allow us to notice, is brought forward by the writers who have been mentioned. On the whole, their articles and those of Sir James Paget and of others who have written on the same side seem to show almost conclusively that, for the majority of those who have hard work to do and are subject to the wear and tear of modern life, drinking wine in moderation is not only good, but is often absolutely necessary.

This granted, however, another question immediately arises. What is moderation in drinking wine? What is the amount which a man ought not to exceed in his daily consumption? Sir James Paget declined to answer the question; but his reticence has not been copied by two of the medical men who have lately written on this subject. They do attempt to answer the question, and it is to be feared that the reply they give will be not a little disappointing to many who, without being given to excess, are fond of sound claret or ancient hock. The amount of wine allowed is so small that it will seem almost worse than none at all; at least it is to be feared that this will be the feeling of a considerable number of those who learn the very small quantity which Dr. Kidd and Dr. Garrod, who speak definitely on this point, allow. The former refers to the scientific experiments on the use of alcoholic fluids made by the late Dr. Anstie and by Dr. Dupré. These showed that about one ounce and a half of absolute alcohol was "the limit to the food use of that substance." Up to that point the alcohol had no injurious effect upon any organ or upon the blood. This quantity of absolute alcohol corresponds, according to Dr. Kidd, to nearly six table-spoonfuls of brandy, to four small glasses of port or sherry, or nearly twice as much of claret, hock, or chablis. A man must not, however, think that he is to be allowed to drink this quantity of spirit or of any one of these wines, although certainly it is not large. Dr. Kidd says that half of it is the "dose" to be advised, and therefore he who wishes to adhere to a rule based on scientific knowledge must not apparently take more than this amount in the twenty-four hours. We say apparently, because Dr. Kidd does not make it perfectly clear that a man might not take this amount twice in the day with impunity, if the meals at which it was taken were separated by a very wide interval. Dr. Garrod, whose opinion in these matters must carry the greatest weight, allows rather more than Dr. Kidd, although he apparently considers that one ounce of alcohol is the limit of the food use. According to him, "the quantity of alcohol taken in the twenty-four hours should seldom exceed that contained in half a bottle of claret of good quality." There would be about the same amount of alcohol in half an imperial pint of Champagne or Burgundy, in a quarter of a pint of port, sherry, or Madeira, and in three-quarters of a pint of pale ale or stout. Such are the quantities which—subject of course to departures from the rule occasioned by the varying strengths of liquors of the same name—should never be exceeded. Not the slightest excuse for indulgence, even of the

most gentle kind, is therefore offered, but rather a strict discipline is enforced. Very many men would find it easier to forego wine altogether than to confine themselves strictly to such small measures, and temperance would thus demand more steady and persistent self-control than abstinence. There is indeed one ground for thinking that such severe restriction may not prove to be absolutely necessary, as Dr. Garrod, like Dr. Kidd, does not make it perfectly evident that there would be any harm in drinking the quantities he mentions twice during the twenty-four hours. If alcohol is within certain limits really food, can it not be consumed in the system in less time than a day and a night?

It need hardly be said that, while advocating the moderate consumption of alcohol, the doctors who have been mentioned most energetically denounce excess. Few men indeed feel more strongly on this subject than physicians, on account of their exact knowledge of the physical evils produced by intemperance. A good deal is said about these in the papers on which we have now commented, though perhaps this was scarcely necessary in essays likely to be read only by educated men, who are well aware that drunkenness must do irreparable harm. It is much to be wished that others could be addressed, and that means could be found to bring the information contained in such writings as these before uneducated men; for probably there is nothing to which intemperance is so much to be attributed as to the profound ignorance of the working classes respecting the effects of alcohol. If they could be disabused of their absurd superstitions about it, and if the proofs of its injurious effects could be brought clearly and exactly before them, it is not impossible that a great change might be in time effected. The same alteration that there has been in the habits of the upper classes might be brought about in other classes by the same cause. Men are now moderate as compared with their forefathers, not merely because drunkenness is considered disgraceful, but also because they know the immense injury that may be caused by excess in wine, which their forefathers did not know. If the same lesson could be taught to the poorer classes a like result might in time follow; but to teach this lesson very different efforts would be required from those of the Temperance orators—or rather, as they should be called, the Abstinence orators—who are always ready for frothy declamation, but who cannot explain what they have never really learnt. To put before very dull and obstinate people some of the facts ascertained by medical science respecting the action of alcohol, in such a manner that they could understand them, would be much harder work than making florid speeches; but it would have much greater results, for if it could be clearly and thoroughly demonstrated to men how they were poisoning themselves, their attention would be much more effectually roused than it ever could be by flimsy rhetoric concerning the iniquity of drinking.

WILLIAM WYRCESTRE.

JOHN LELAND is called the father of English antiquaries, but William Wyrcestre is the forefather. Nearly a century before Leland went by royal commission over the kingdom to report upon historic buildings and their archives, Wyrcestre had gone at his own pleasure on a similar exploration, and had offered candles at the shrines which the later traveller found wasted and deserted, or on the eve of being so. It is unfortunate that both these worthies wrote the narratives of their wanderings in language so dry and lifeless. It might be thought that the aspect of mediæval England, the final purpose of whose every towered city and village homestead seemed to have been picturesqueness of form and colour at least as much as convenient habitation, would have been reflected in the delineations of men who evidently felt the interest of their own surroundings; but Wyrcestre and Leland have offered the results of their topographical studies in a manner as unimpassioned as a merchant's ledger; which, in fact, their works much resemble through the frequent numerals that appear in every page. But, notwithstanding meagreness of treatment, these works are as valuable to the English antiquary as Pausanias is to the topographer of Greece; and by the mere accumulation of patiently gathered facts Wyrcestre and Leland have erected to themselves monuments, if not more durable than brass, at least as lasting as many brasses, for the tombstone of Wyrcestre himself has disappeared, and the place of his burial is unknown. The inquirer might also look in vain into Chalmers or similar collections for an account of Wyrcestre's life, for he is almost as little indebted to the biographer as to the statuary for commemoration to his grateful followers. Bishop Tanner, who overlooked no Englishman who had written a book or left a manuscript, has included him in his *Scriptores*, but gives little more than a list of his writings—a remark which also applies to the mention of him by Bale and similar compilers. Wyrcestre's limited biography must be gleaned from his *Itinerary* and from his correspondence in the *Paston Letters*. He was the son of a Bristol burgess of the same name as his own; but, instead of the modern fashion of two Christian names, he adopted two surnames, frequently signing himself "Botaner," as well as by his patronymic. This double cognomen has caused Bale to divide his personality and to assign certain works to Botaner and others to Wyrcestre; which former name he assumed, not, according to the conjecture of Lewis in his Life of Caxton, because he was fond of botany, but by reason of its being the maiden name of his mother, who was of a wealthy Coventry family, some of whom were founders of the famous church of St. Michael in that city.

"In the second year of Henry IV.," he says, "William Wyrcestre, my father, took on rental the house of John Sutton upon the Bec, in the parish of St. James (Bristol), in which house I was born" (A.D. 1415). From a contemporary deed we find that this dwelling stood nearly at the south-east end of the street. Until within the last few months St. James's Bec or Back retained the name it had held for five centuries; but, with intelligent disregard for idle historical sentiment, it has been changed by the authorities into "Silver Street," hardly for its brightness, or because silver is plentiful there, for it has degenerated into one of the dingiest and poorest districts of the city. Wyrcestre says that he went to Oxford about the month of June 1432, when the general eclipse on the day of St. Botolph happened. He remained four years a student at Hart Hall, now Balliol College. Though his Latin style was open to no more praise than his English, he was in spirit a true scholar of Oxford, who would rather have at his bed's head Aristotle's *Philosophy* than "richest robes, fiddle, or psaltery." He was instructed in poetry and French by a Lombard named Karoll Giles, and we are assured by his friend Henry Wyndsor that he would "as fain have a book of French or Poetry as Master Fastolf would a fair manor." To the Master Fastolf here referred to, Wyrcestre upon leaving the University became secretary and pursuivant, attending him, according to Wood, "with his coat when he went upon any encounter." Wyrcestre's son seems to verify this by saying, in the dedication of a book to Edward IV., that his "pore fadyr William Wyrcestre sometime servaunte and soget with his Reverend master John Fastolf chevalier exercised in the werres continually above XL years." We join with Anstis, who cites this passage, in regretting, as he does in his register of the Knights of the Garter, that the *Acta Domini Johannis Fastolf*, which Bale had seen and quotes, should have been lost. Wyrcestre, as an eye-witness of the knight's career, might have shown in that work the difference between the dramatic Falstaff and the historical Fastolf. His letters supply characteristics from which to prove Fastolf's unlikeness to the Falstaff of *Henry IV.* and the *Merry Wives of Windsor*, and his identity with the Sir John Fastolfe of *Henry VI.* The vapouring knight of the first two of these dramas belongs to a quite different type of character from the real hero. It is as certain that the Fastolfe of *Henry VI.* was Wyrcestre's master as that the Falstaff of *Henry IV.* and *The Merry Wives of Windsor* was not. In spite of Schlegel's opinion of the unity of the character through the three separate plays, two distinct persons are portrayed. It is admitted by critics that the Sir John Falstaff of *Henry IV.* is identical with the Sir John Oldcastle of the older drama, on which Shakspeare founded his own—the original name, according to Mr. Halliwell, having been retained in the earlier representations of *Henry IV.* on the stage. Whether the character was imaginary or a distortion of that of the martyr is perhaps a question; but the mere change of name did not touch its identity. Wyrcestre himself speaks of "John Oldcastle" as a "heretic," which sufficiently proves his distinctness from Fastolf, which is only a different way of spelling Falstaff. The Sir John Fastolfe of *Henry VI.* is drawn from history, though not with fairness. His actions in the French wars have been well vindicated from the cowardice with which Shakspeare makes Sir John Talbot charge him, but his manners at home were such as to give ample scope for Wyrcestre's capacity for sufferance. He was proud and petulant, and by no means lavish in recompense for services. Of the merry humour of the ideal Falstaff he had none; but, as Mr. Gairdner remarks, of bad humour he had abundance, and there is rich exemplification of it in the *Paston Letters*. "At reverence with God," says Wyrcestre, in a letter to John Paston, A.D. 1456, "be as soon as ye may with my master to ease his sprites. He questioneth and disputeth with his servants here and will not be answered nor satisfied, some time, but after his wilfulness, for it suffisith not our simple wits to appease his soul"; and the writer wishes that Paston, or some other of more influence than himself, might "hang at his (master's) girdle daily" to answer his complaints. He tells Paston to drop the name of "Mastre Wyrcestre," for his "five shilling a year wages," besides maintenance, hardly kept him in "bonnets," and did not entitle him to the distinction of "master." Fastolf died in 1459 at Caistor Castle, Wyrcestre being at his death-bed. The letter of Friar Brackley summoning John Paston to the dying knight is almost as realistic as Dame Quickly's narrative of the departure of his namesake to "Arthur's bosom." "Ryte reverent master, as soon as ye may goodly come to Cayster. It is high time; he draweth fast homeward, and is right low brought, and sore weakened and feebled. Every day this five days he said, God send me soon my good cousin Paston, for I hold him a faithful man and ever one man" (I. 444). Whatever moroseness was in the temper of Fastolf, it did not alienate the affection of his tried servant William Wyrcestre, who resolved to have "no master but his old master," for whose sake he had gone many a "shrewd journey." Wyrcestre was appointed one of the executors of Fastolf's testament, with Waynflete Bishop of Winchester and others. The administration of the will was the occasion of litigation in the spiritual courts, Wyrcestre being involved in controversy with Sir John Paston and Thomas Howes, Fastolf's chaplain, in the cause. A correspondent advised Paston, for "our Lord's love," to become reconciled with William Wyrcestre, "for it is a common proverb, 'A man must sometimes set a candle before

the devil'"; and Lord Beauchamp, without the application of any such complimentary adage, recommended the like policy, saying that Wyrcestre wanted to return to his own country. The dispute continued till December 7, 1472, when Bishop Waynflete paid 100*l.* to Wyrcestre in quittance for his claim upon Fastolf's estate.

In August 1473 Wyrcestre presented his friend Waynflete with a copy of an English version which he had made of Cicero *De Senectute*, but he complains that he received nothing in return; which Chandler, the prelate's biographer, suggests was about the worth of the translation. It was, however, published by the father of English printers. Copies of the "*Boke* of *Tulle* of *Old Age*, &c., emprynted by me symple person William Caxton into Englysshe at the playsir solace and reverence of men growing into olde age the xii day of Aug. the yere of our lord M CCCC lxxxj," were exhibited at the Caxton celebration, but Caxton does not mention who was the author of the version.

Next to Wyrcestre's love of literature was his fondness for architecture; but his enthusiasm on this subject chiefly spent itself in ascertaining the dimensions of the numerous buildings he visited. To know distances seems hardly less a matter of instinctive curiosity than to find out causes. Wyrcestre took as much interest in numbering the paces between the east and west end of an abbey church, and guessing the altitude of its tower, as the astronomer finds in settling the distance between the sun and the moon. The *Anabasis* does not more teem with parasangs than his Itinerary with *gressus* and *virgæ*. His method was rude, but it may be ascertained from his own representation that his *gressus*, or pace, is about two feet. For instance, he tells us that the length of St. Paul's, London, was 180 *gradus*, and of the choir, with St. Mary's Chapel, 130 *gradus*, which dimensions nearly correspond with Mr. Ferrey's computations, with which Mr. Longman agrees, who gives 596 feet as the entire length of the building; the breadth, according to the same modern authority, being 104 feet, and by Wyrcestre's paces 48 *gradus*, or 96 feet. The length of St. Mary, Redcliff, by the latter's reckoning, is 242 feet, and by later measurement 239. Many are the buildings of which only Wyrcestre's dimensions are left. The chapel of St. Anne-in-the-Wood, at Brislington, near Bristol, in his time a favourite place of pilgrimage, is one of these; which we specially mention because it has been forgotten in the *Quarterly Review* article and other general accounts of mediæval English shrines. Dr. Powell (*temp.* Henry VIII.) classed St. Anne's with Walsingham, as one that ensured the almsgiving devotee a hundred times the value of his offering in the present world, and everlasting life beyond. When Henry VII., Elizabeth of York, and Bounteous Buckingham in their days made oblations there, the scene was picturesque enough to captivate a Cistercian abbot. It is picturesque now. The wooded valley on the border of the Avon which gave name to the spot exists, though rarely visited; but the Gothic chapel that was strengthened by nineteen buttresses has as completely vanished as the summer clouds that floated over it. Wyrcestre's fondest attention was given to his native city, and there is no mediæval delineation of any English borough so exhaustive as his survey of Bristol. By a careful study of his Itinerary a painter might throw upon canvas a picture of a fifteenth-century walled city that would form a typical example of what such a city was. It may be gathered from his description that there were seventy towers crowning its walls, or embraced by their circuit.

It must have been an enviable journey that Wyrcestre drily narrates that he made to St. Michael's Mount in Cornwall. Even the fragments of many of the noble buildings he saw in their grandeur are enough now to set archæological minds aglow. On Monday, 17th August, 1453, he tells us that he left Norwich; and, having delayed some days in London, he rode on to Winchester, where he dined with his friend Bishop Waynflete. After staying at Romsey and Salisbury, he attended on Sunday the Mass of St. Edith at Wilton Abbey, of which hardly a trace now remains. Passing Stanley Abbey, which has likewise disappeared, he came to Castlecomb, and on to Bristol. Crossing the Severn to Chepstow, he lodged at Tintern Abbey, where he made extracts from the register, carefully numbered the windows and pillars, took the dimensions of every part, and gathered the information which he supplies concerning the neighbourhood. On the 7th September we find him at Westbury-on-Trym, where he heard divine service in the beautiful church, yet standing, of the monastery founded before A.D. 892, and destroyed by Prince Rupert in 1645. The next day he slept at Wells, and on Thursday he was at Glastonbury. He kindles into no rapture at the sight of the mother-church of England, then in the height of its architectural and ritual splendour; but he atones for want of enthusiasm by the useful information he gives. On Monday, 14th September, he rode from Launceston Priory across the moor, where his horse fell, on his way to Bodmin. From the Calendar of the Minor Friars of that place he extracts mention of a plague which visited the town about Christmas 1351, and destroyed 1,500 persons. On Wednesday, September 16, he was at Truro looking over the Friars Preachers' Martyrology, and the next day he heard mass at the "vision-guarded Mount," the four famous apparitions of which are carefully recorded. On his return journey from St. Michael's he lodged at Tavistock Abbey, of which he gives many particulars. At Weston he conversed with the Abbot of Glastonbury, and at Muchelney Abbey he had an interview with the abbot of that Benedictine house. The subjects of his conversation with these dignitaries are not recorded, but on many occasions he gives notes of the information he drew from less important persons whom he met; for, like his measurements and extracts from monastic registers, his facts were gathered on the spot. From "Celere," an esquire of the household of Thomas Beaufort, Duke of Exeter, he learns that there were 140 gentlemen servitors in that nobleman's house, the names of 30 of whom he gives, receiving each 5 marks yearly. Every day from 200 to 300 poor people were fed at the duke's expense, who also gave each of his almsmen a gown twice a year. On the same authority he gives the names of certain of the company who were with John Duke of Norfolk when returning in his barge from dining, perhaps too freely, at the table of the Cardinal of England, and were submerged at London Bridge, sixteen of the Duke's household being drowned. From "Master John Smythe," Bishop of Llandaff, he receives some account of the saints of Wales, among these being *S. Imael Episcopus*, who, under the form of S. Ishmael in the dedication of several churches, has caused confusion by being mistaken for the son of Abraham, who is as yet uncanonized. From an ancient calendar belonging to George Heyyrston of Norwich, A.D. 1478, he supplies the names of twenty Premonstratensian abbeys of England and Scotland. Among his personal recollections he mentions that he saw the murdered body of Thomas Lord Scales lying naked for some hours in the churchyard near the porch of St. Mary Overy in Southwark. Sir Bernard Burke, in his *Extinct Peerages*, seems in doubt whether to decide with Story that Lord Scales died by violence, or with Dugdale, who says that "he departed this life"; but Wyrcestre states that he was killed (25 July, 1460) in a scuffle with some sailors under the wall of the Bishop of Winton's palace on the bank of the Thames. The commentator on Shakespeare's *Richard II.* may, in connexion with the note in the Clarendon Press edition of that play, get a hint (*Annales*, 517) concerning the identity of Barcloughly Castle, in sight of which the poet represents the King as landing when he returned from Ireland to meet the invasion of Bolingbroke. The numerous waifs and strays of hagiology, biography, and folk-lore, as well as of topography and contemporary history, that are to be found only in Wyrcestre, commend his unpretending books to more attention from the student of mediæval history than they have received. We hope the edition of the *Itineraria*, by Nasmith, 1778, and of the *Annales Rerum Anglicarum* (1324-1468), by Hearne, 1771, will be re-edited in the Rolls Series, and supplemented from his inedited MSS.

Wyrcestre retired in his old age to his native city; and, under the battlements of the castle, devoted his time to practising physic and to the cultivation of medicinal herbs, finding, like Friar Laurence, that

> Mickle is the powerful grace that lies
> In herbs, plants, stones, and their true qualities.

He is believed to have died about A.D. 1479.

THE THREATENED WAR OF TARIFFS.

THE prospects of Protectionism at the present moment strongly remind one of the extraordinary recovery of the Chinese Empire. A quarter of a century ago China seemed to be falling to pieces. Yunnan, Kashgar, and other outlying provinces had shaken off the Emperor's authority, a victorious rebellion was ravaging the heart of the empire, and a British Colonial Governor was confident that he could effect the conquest of the whole country with fifty thousand men. All at once there was a change. The Taepings were extirpated. Yunnan, Kashgar, and the other insurgent provinces were reconquered, and now a struggle seems about to begin with Russia for the last town to be recovered. A little while ago Protection seemed to be in as desperate a case as China herself in her darkest hour, and at this instant it is displaying an equally unexpected vigour. When the Emperor Napoleon concluded the famous Anglo-French Commercial Treaty, he was at the zenith of his influence. The world regarded him with awe and admiration, and surrounding nations humbly imitated his policy. Commercial treaties became the fashion, and in a very short time there was scarcely a European State which had not bound itself to admit the goods of its neighbours on easier terms than formerly. Enthusiastic economists saw in all this the beginnings of a millennium when custom-houses would be kept up only for revenue purposes, and every nation would devote itself to the production of those commodities alone for which it was best fitted. For a while events seemed to favour the expectations of the enthusiasts. The world increased rapidly in wealth, the condition of the masses of the population was greatly improved, and, if men would only be guided by their reason in business matters, the victory of Free-trade was assured. Unfortunately the growth of the military spirit was even more rapid than that of the commercial. Louis Napoleon had risen by means of the army, and upon its support he was obliged to lean. His armaments alarmed his neighbours, and led to counter-armaments. War followed war, armies expanded until at last they included the whole male population, and military budgets swelled until they oppressed industry. Reckless speculation in railways, banks, and joint-stock enterprise of every kind, wild borrowing ending in extensive repudiation, bad harvests, cattle disease, famines, over-production, and the political uncertainties caused by the reopening of the Eastern question, aggravated the situation, and resulted in panic, crisis, and universal depression of trade. Here was the opportunity for the Protectionists, and they seized it. The condition of trade was bad in all countries alike; yet in this age of

newspapers and universal enlightenment it was found an easy task to persuade each people in particular that its sufferings were singular and were due to Free-trade. Naturally the most ignorant and most backward populations were the most easily convinced. Spain led the way, loading English and French goods with heavy duties. Italy followed next. And now it is the turn of Austria-Hungary. Germany is treading close upon the heels of her southern neighbours. And it has been feared that France would bring up the rear. The negotiations between France and Austria-Hungary for the renewal of the commercial treaty between them were continued up to the very end of the past year, and were then abruptly broken off. With whom the fault rests we are unable to say. In France M. Waddington is severely censured, and the fact that he at the same time gave notice to terminate the treaties into which France had entered with other countries has been regarded as a strong point in the case of his accusers. On the other hand, Austria-Hungary had just failed to renew the treaty with Germany, and Prince Bismarck's letter to the Federal Council informed her statesmen that he was about to arm himself with the means of coercing those with whom he might have to negotiate in the future. The knowledge of this no doubt determined the Austro-Hungarian Government not to tie its hands by premature engagements with France. Probably, indeed, we shall not be far wrong in assuming that Prince Bismarck's letter was the immediate cause of both the French and the Austro-Hungarian decisions. His influence is now hardly inferior to that exercised by Napoleon III. in 1860, and can scarcely fail to have equally far-reaching consequences.

However this may be, the end of the Austro-French Treaty has had consequences for which the English public was not prepared. That treaty was concluded six years later than the Anglo-French Treaty, and also later than the conventions between France and most other States. It was consequently more liberal than any of these, and in great measure made their stipulations obsolete. All these several States, however, had an agreement with France that she should extend to them the treatment of the most favoured nation; and by virtue of this clause they at once participated in all the advantages of the treaty with Austria-Hungary. Thus, when that treaty was abruptly terminated a fortnight ago, the subjects of those States found tariffs applied to them, without notice, of the existence of which many of them were ignorant. The hardship was very real. As between France and Austria-Hungary, the respective general tariffs were applied; and it is said that the increase of duties upon Austrian goods in France is so great that the Vienna Government has it in contemplation to make use of a clause in last year's Tariff Act which authorizes the imposition of an additional ten per cent. upon all goods coming from a country which does not extend to Austria-Hungary the treatment of the most favoured nation. If this report proves correct, France will not be slow to retaliate; and the war of tariffs which is the logical result of universal Protection will have been begun upon the Continent. Should Prince Bismarck be successful in his protectionist projects, he will speedily join in the hostilities. Already, a couple of years ago, he asked for power to impose retaliatory duties upon France, on the ground that by her system of bounties she handicaps German industry. It is understood that he is about to renew the proposal. In any case, he will, if he can, restore the protective *régime* in Germany. In the meantime the French Foreign Office has denounced the still subsisting treaties - that with this country amongst others. It is difficult to understand the motives of this proceeding. M. Léon Say, the Minister of Finance, is a distinguished economist and an hereditary Free-trader. M. Gambetta, too, the leader of the Republicans, is an avowed Free-trader. It seems incredible, therefore, that a return to Protection can be contemplated. In spite of the activity of the Protectionist party, the replies given to the circulars addressed by successive Ministers of Commerce to the Chambers of Commerce throughout the country prove that public sentiment is in favour of more liberal commercial treaties. To return to Protection, therefore, would be not only to act contrary to the declared opinions of the Republican leaders, but to fail to carry out the wishes of the people, and to leave to the Bonapartists the defence of Free-trade. On the other hand, it must be remembered that the denunciation of the treaties was not required in order to hasten their renewal. So far, at least, as our own country is concerned, we have been ready to proceed with the work for several years past; indeed we had been engaged in it when a change of Ministry in France disturbed the negotiations. Now, however, that the supremacy of the Republicans is assured, there is nothing to prevent the negotiations from being resumed at any moment. Nor, again, was the denunciation necessary to facilitate the consideration of the general tariff. We are therefore driven to the conclusion that the measure was taken in consequence of Prince Bismarck's letter. The very suddenness with which the notices were given supports this conclusion. And it was natural that, in view of the new situation about to be created in Germany, the French Government should think precautions expedient, and, above all, should desire to recover full liberty of action. Such, in fact, is the explanation given by the French Government itself, which explicitly declares that "France will use her freedom of action without deviating from the principles which for some years have given so great an extension to business."

In this state of things the prospects of European trade are not encouraging. Whatever may be the case in France, the success of Protection is almost certain elsewhere on the Continent. Duties which were already nearly prohibitive were raised fifteen per cent. in Russia two years ago by the requirement that they should be paid in gold. They have just been again increased on the desperate chance of furnishing the means to pay the interest on the newly accumulated debt. Austria-Hungary has just put in force a tariff which very greatly increases the duties all round, and then enhances them still further by insisting that they shall be paid in gold. Of Italy and Spain we need not speak, any more than of the United States. There is no reason to doubt that Prince Bismarck will succeed in his plans; and Switzerland seems resolved to follow in the same course. Thus we seem likely to see the whole Continent, except perhaps France, Belgium, Holland, and Turkey, closed against us. The loss will fall chiefly upon the countries which adopt this false and mischievous policy, though of course we shall be sufferers also. Their energies will to a great extent be wasted in producing commodities badly and dearly which are produced cheaper and better elsewhere. In his turn the consumer will have to pay extravagantly for what he buys, and consequently there will be less margin for saving. Some new industries may possibly be created that will be a permanent source of wealth, just as the beet-root industry was fostered by the Continental blockade. But, taking a broad view, it is certain that capital will to a large extent be misdirected, that force will be wasted, and that great trades will be nursed into sickly life, which will perish whenever they are again exposed to competition. Thus the general result of this movement will be to check the growth of wealth upon the Continent, and to make industrial progress slower than it is with ourselves. From a political point of view the reaction which is going on before our eyes is interesting, as showing the instability of reforms originated from above. The Governments of Europe generally were economically more enlightened than their subjects, and they entered into agreements with one another to facilitate international intercourse. The experiment succeeded admirably, but it did not convert the populations. They regarded Free-trade as good for fair weather, but when stormy times set in they cried out once more for Protection. It may be argued, therefore, that commercial treaties are useless, and that it is better to let people learn the evils of Protection from experience; but this would be an over-hasty conclusion to draw. In France we have the example of at least one great country which, there is reason to hope, has been effectually converted to sound principles by experimental proof of their success; and had the treaties been longer continued, other countries also might have taken the lesson to heart. In any case it is the duty of Governments, without troubling themselves with theoretical doubts, to insure for their subjects all the practical advantages they can obtain.

OLD MASTERS AT THE ROYAL ACADEMY.

THE new President of the Royal Academy has every reason to be satisfied with the first exhibition given under his rule. There is not among the paintings any such speciality as was found on a former occasion in the collection of Raeburn's portraits, and last year in that of pictures of the Norfolk school; but while the paintings exhibited are fully up to the mark of past years, there is added to them a marvellously fine collection of drawings. In the paintings, which alone we propose to consider in this article, the English school is in some respects less well represented than it has been of late at this exhibition. The Gainsboroughs, for instance, with the notable exception of one exquisite picture which the Catalogue assigns to Gainsborough, but which people best qualified to decide on such a matter do not recognize as his work, are certainly as a rule inferior to those of the last two years. The exception of which we speak is No. 5 in the first room, a portrait of a girl, "supposed to be a daughter of Lyttelton Poyntz Meynell, Esq.," in a straw hat. The treatment of the picture, which is singularly fine and striking, is certainly unlike that which we are accustomed to find in Gainsborough's work, but has a considerable resemblance to that of Hoppner. We may turn to some undoubted Gainsboroughs in this room as instances of what we have said as to the comparative inferiority of the works of this painter which are shown this year. In the "Portrait of Lady Whichcote" (13) the dog who holds his paw in the lady's lap is wonderfully true and life-like, but there is a strange feebleness and untruth in the drawing of the lady's figure. Again, "The Pink Boy" (39), which by its title challenges comparison with the celebrated "Blue Boy," has a curiously unpleasant effect running all through the colouring of the figure. To make up for this the background is singularly fine, and in the painter's best manner. The examples of Reynolds in this room are far more fortunate than those of Gainsborough. The portrait of Charles James Fox (17) is very striking, as is also that of "William, second Duke of Leinster" (44), in which the hands might be advantageously studied by all young portrait-painters; while the next picture—"Prince William Frederick of Gloucester" (45)—which is one of the treasures of Trinity College, Cambridge, is perhaps as beautiful an example of Sir Joshua's work as can be anywhere seen. Romney is represented by a fine "Lady Hamilton" (35) and by portraits of Mr. Lee Acton and his two wives (41, 20, 42). In the women's portraits (20, 42) one may discern, especially in the pose of the arms, the trick, as well as the true sense of beauty, which gives a charm to Romney's work. Mr. Lee Acton's portrait (41) shows a strength and perception of character on which the painter comparatively seldom relied. From the Fitzwilliam

Museum at Cambridge come two fine Hogarths, "Portrait of Dr. Arnold" (32) and "Portrait of Miss Arnold" (36). Among the figure pictures "The Return from Shooting" (14), by Wheatley, is attractive by its complete simplicity, being merely a faithful rendering of such a scene as, allowing for difference of costume, may be seen any day in the shooting season, without any idea of "making a picture." Such a thing cannot of course take any high rank as a work of art; but it is perhaps to be preferred to some so-called high art of the present day. Zoffany—whose two little figures of "Garrick and his Wife" (34), standing in front of a formal little villa, have a decided pleasantness about them—is also represented by a marvellously odd picture of "A Musical Party on the Thames; Portraits of the Family of William Sharp" (27). How the thirteen people who are crowded higgledy-piggledy together on the canvas managed to retain their various positions without upsetting either themselves or the boat must remain unexplained. There is no kind of artistic idea in the grouping and arrangement of the work, but each figure is full of character, and painted with extreme care, while there is a decided charm about the landscape background. Close to this hang two fine examples (25, 28) of Chardin, a painter whose work is comparatively little seen in England. Among the landscapes we may direct attention to "A Surrey Lane" (7), painted by Nasmyth, very much in the manner of Hobbema, to a landscape with figures by Morland (21), in which there is a wonderful sense of bright open air, and to a fine Constable (22) which hangs next to it, and in which the effect of a storm looming in the distance is particularly fine.

The Second Gallery has several fine portraits, among them two of a Dutch lady, and of a Dutch gentleman holding a glove (64, 68), by Bartholomew van der Helst. The second of those is extremely fine and powerful in pose and execution, and reminds one in one point of Titian's well-known "L'Homme au Gant" in the Louvre. The glove is in each case of the same kind, and a comparison of the masterly painting of the hands in both pictures might be of interest. In Van der Helst's portrait of the man there is a certain hardness in the contrast between the perhaps obtrusively white ruff and the black dress, which is avoided in the portrait of the lady, where a soft yellowish tinge is given to the ruff. Near the second of these portraits hangs one of a man by Frank Hals (71), which, if a little rough, is a fine specimen of this master's strength and discernment. Two landscapes, from the Fitzwilliam Museum at Cambridge, to which they were presented by Mr. Vansittart, a Ruysdael (79) and a Hobbema (84), are extremely good examples. Mr. Sandars sends two or three exquisite little works from his collection. Among them is a Van der Heyde, a "Street Scene in Utrecht" (92), which is certainly one of the most beautiful specimens of this painter's work in existence. The impression of daylight is marvellous, as is the extraordinarily minute, but never niggling, work bestowed on the architectural part of the picture. Such work as this should be a lesson to the people whose unhappy ideas as to the right way of catching a particular effect of light have led to the mischievous tenets of the "impressionist" school, or rather nursery. Another picture from the same collection, an "Italian Landscape," by Karel du Jardin (73), has perfect appreciation and rendering of natural beauty. The room contains several pictures by Teniers, one of which (75) is notable from the extraordinary and humorous aspect given to it by the insertion of mythological figures by another hand in the foreground. Van de Velde is also well represented, especially by "The Evening Gun" (72), in which the treatment of the light is even unusually fine. There are three Jan Steens (54, 57, 99). The first of these, which is called "Saying Grace," has a curious ugly tenderness, if we may use such an expression; the last, "A Dutch Festival," exhibits the painter's merits in a marked degree, but is oddly disfigured by the manner in which the central figure, by no means an attractive one, seems to come out of the picture, a defect which may be in some measure due to the efforts of cleaners.

The third and largest Gallery contains some very fine works, although it is not filled as it has been on some former occasions of these exhibitions. The "Sketch for the Ceiling at Whitehall Chapel," by Rubens (122), is interesting, and is one of the many things which show how much pains was taken by the so-called Old Masters in the execution of their work. Of three Murillos (117, 121, and 132), the last is the most remarkable; but cannot compare in excellence with the well-known similar subject by the same master in the Salon Carré at the Louvre. "The Rinaldo and Armida" (126) bearing the name of Vandyck is a magnificent specimen of the Flemish school attempting, and not unsuccessfully, to emulate the colouring of the Venetians. It is a fine composition, full of good drawing, and altogether a considerable performance. The Portrait of a Lady, ascribed to Lionardo (125), is at any rate a fine work of his school, and the companion picture (127), ascribed to Andrea Salaino, is well worth attention, as affording an early example of the sort of background much affected by some modern artists. It is a most beautiful study of foliage, while the figure is much out of drawing. The study for the heads of the infant children of Charles I.—the little Princess Elizabeth and Duke of Gloucester—by Vandyck (131), is very charming. The "Rape of Proserpine" (136), whatever may be thought as to its complete authenticity, but which seems entirely worthy of the hand, that of Titian, to which it is attributed, is a strong and grandly coloured picture. The horses are very powerful, and seem quite capable of forcing their way through the bed of a river, or even of bursting through the solid earth. It is a work of which the possession may be envied. The mention of No. 139, as a portrait of Vittoria Colonna, is enough to give it interest; but it is a fine picture, well painted and exhibiting a countenance full of meaning. This lady died at the age of fifty-seven, and the features may not be those of an older woman, although the general aspect would seem to suggest a more advanced age. Of the two Tintorettos in the room, one (144) is terribly injured, and the other, a very large canvas (141), is a noble specimen of the school to which it belongs, and in it the costumes of the ladies and gentlemen introduced, certainly not beautiful in themselves, and which to the artist must have been modern, have been made eminently picturesque. A so-called Giorgione (145) can hardly be the work of that painter. It is remarkably clumsy and awkward in its figures, but may be looked into with advantage for the sake of its colour. No. 150, ascribed to Veronese, does not seem to be his work, but from internal evidence may be supposed to be that of Bassano. The portrait of Henriotta Maria gives a faded version of her early beauty, and asserts itself as a likeness, whether painted by the French artist mentioned in the Catalogue, or by the Flemish one named upon the frame. The Cuyp (164) is a beautiful picture, exhibiting the artist at his best in his well-known powers, but also revealing a grace in the treatment of child and animal life which will have novelty for most of us. Vandyck's "Doge of Genoa" (168) is wonderful for its treatment of such a mass of crimson drapery, as well as for its impressive portraiture. The Fourth Gallery is devoted to early oil-paintings of the Italian, Flemish, and German schools. Mr. Graham's "John Bellini" (203) is the finest thing in this room, and is in splendid preservation. Albert Dürer's "Virgin and Child" (217) is a very remarkable little picture, uniting a surprising effect of air and space with the most minute elaboration of details. It is a perfect gem of execution. The portrait of a man and woman in No. 219 may probably have come from a greater hand and from a different school than that to which Quentin Matsys belonged—perhaps indeed they may be justly ascribed to the greatest portrait-painter of the period. The last Gallery of those devoted to oil-paintings contains some fine specimens of Snyders, and of the great English animal-painters, Stubbs and Ward, and has in it a most beautiful small Canaletto (236). We propose on another occasion to return to the Royal Academy and dwell upon the marvellous collections of miniatures and drawings by the Old Masters now exhibited.

REVIEWS.

THE HIBBERT LECTURES.*

It may be doubted whether we yet know so much about religion that we can discuss its origin with profit. About its origin, however, people are always anxious to hear and to talk; and many so-called springs of religion have been discovered, from a primæval instinct to the custom of tattooing. Lecturing at the Chapter House, Westminster Abbey, Professor Max Müller declined to admit either of these extreme hypotheses. He did not hold that the first men who believed and worshipped had received any sudden revelation, and he did not hold that they started with what is vaguely called "fetichism." What he did not believe he made clear enough; what he did hold to be true was less manifest. He averred that the "growth of the religion of the ancient Aryans of India was very different from the growth of other religions" (p. 50); but he held apparently that all religions were so far at least evolved in the same way that they did not spring from "fetichism." "We are bound to look elsewhere if we wish to discover what were the sensuous impressions that first filled the human mind with a suspicion of the supersensuous, the infinite, and the divine" (p. 127). Mr. Max Müller tells us very plainly what those sensuous impressions were in the case of the Aryans of India. If he distinguishes between "growth" and "origin," we may perhaps conclude that he supposes the same sensuous impressions (those produced by rivers, mountains, the sky, the rain, the dawn, the sun) to have first led the minds of Hottentots and Weddahs to the thought of the divine, or of whatever working substitute for that thought they may possess.

In the evolution of religion there are, in Professor Max Müller's theory, two elements. There is something in man, and something in the external world. What is in man the "seed" of all religions is "the perception of the infinite from which no one can escape who does not wilfully shut his eyes. From the first flutter of human consciousness that perception underlies all the other perceptions of our senses, all our imaginings, all our concepts, and every argument of our reason." Now what does Mr. Max Müller mean by the infinite? We may misunderstand him, but he appears to us only to mean the knowledge that there is *something* beyond what the eye sees, what the hand touches, what the mind has acquired as the result of actual experience. This knowledge, the result of every conscious action, is not, as Mr. Max Müller admits, definitely and explicitly presented to himself by untutored man. Children, savages, untaught people, know that there are expanses beyond their knowledge; but of "the infinite" they do not think or speak. "Everything of which his

* *Lectures on the Growth and Origin of Religion, as Illustrated by the Religions of India.* By F. Max Müller, M.A. London: Longmans & Co.; Williams & Norgate. 1878.

senses cannot perceive a limit is, to a primitive savage, or to any man in an early stage of intellectual activity, unlimited or infinite. Man sees, he sees to a certain point; and there his eyesight breaks down. But exactly where his sight breaks down there presses upon him, whether he likes it or not, the perception of the unlimited or the infinite" (p. 37). We would prefer to say that "experience shows him there is something beyond"; but, however we state it, this perception of the lack of definite bounds, of the existence of somewhat outside the ken of mind and body, is, if we understand Mr. Müller, the seed from which religions spring. As Mr. Müller has made the first cellule, so to speak, of this seed—namely, the invariable physical experience of a somewhat beyond—so plain, it is not clear why he postulates, "besides the sensuous and the rational, a third function of the conscious self, for apprehending the infinite" (p. 26). He does postulate this third function of the conscious self, and he declares, not only that it is the seed of all religions, but that it is the subjective side of religion. He wrote in 1873, and he only slightly modifies the statement of his opinion, "Religion is a mental faculty which, independent of, nay, in spite of, sense and reason, enables man to apprehend the infinite under different names and under varying disguises" (p. 23). Mr. Müller is ready, if any one prefers the terms, to say that "the subjective side of religion is not a faculty, but a potential energy, which enables man to apprehend the infinite." In his earlier definitions, too, Mr. Müller meant by religion only the "subjective side of it"; but to begin a paragraph with the assertion that "Religion is a mental faculty" is not unlikely to mislead, and indeed did for the moment bewilder us.

The "subjective element," then, in religion—the element in man and given by man—is the apprehension of the infinite, and the infinite is apprehended by a separate function of the conscious self. No one is very likely to admit the need of a separate function for the apprehension of the infinite who knows that his senses continually fail to give him the full extent of a view and never present an unlimited tangible object; while his reason is capable of erecting this failure of sense into a general rule that sense always will fail to reach a definite limit beyond which is nothingness. Again, even if we have a third function which apprehends the infinite, that function is as busy in creating the rest of our knowledge as in producing religion. Our knowledge depends for its very existence on the contrast and combination of the πέρας and the ἄπειρον. Men wander over the mountain to see what is beyond (which is "infinite," as Mr. Müller says, to them—p. 37). They fashion tales to explain astronomical or terrestrial facts of which the causes are beyond their knowledge; and thus early science and early religion are so far alike that they both spring from the perception of the infinite. Thus Mr. Müller's definition seems to cover too much. The untutored man does not knowingly look for what we now call the infinite in his religion, his science, or his geographical explorations. For his own "infinite"—namely, the nearest portion of

> that untravell'd world, whose margin fades
> For ever and for ever when he moves,

he seeks as much in science and in physics as in religion. Thus Mr. Müller's "third function" seems needless, and the function, if it exists, or the knowledge of the absence of limit, however obtained by man, works not in the production of religion alone, but in all the conduct of life. It is not our business to suggest a better definition; but we cannot think Mr. Müller's statement of the "subjective side of religion" is entirely satisfactory, unless indeed by infinite he means something which we do not suppose him to mean.

Let us grant that the subjective side somehow exists, as of course we must, if we admit the existence of religion at all. Man is certainly capable, however he comes to be so, of building the fetish huts, the temples, the altars, the shrines of faith. What objects in the outer world or in the world of dreams first awake in him the belief of a power or powers higher than himself? Mr. Max Müller devotes his second lecture to disproving the theory that these objects are the rubbish that the "fetichist" treasures—stones, weeds, and so forth. We do not know that any people whose opinion is worth notice any longer look on "fetichism" as the sole origin of religion. Mr. Max Müller easily explodes the obsolete ideas of inquirers who confused the worship paid to imposing hills or streams, the cult offered to animals, and the veneration for mere scraps and odds and ends, in their sweeping use of the word fetichism. He easily proves, too, that many races that adore rubbish have in the background of their minds loftier ideas of divinity. He shows that numbers of Christian races, or of races given over to the most refined paganism, have practised fetichistic rites, and he asks why, if Russians and Romans, who were in the first place Christians or worshippers of the Olympians, practised fetichism, a savage who practises fetichism should not be, in the first place, a theist of some comparatively noble sort. The superstitious reverence for rubbish is universal, and Mr. Max Müller maintains that "it is a corruption of religion." One answer to all this is only too obvious. It is only Mr. Müller who chooses to say that "all that can be called fetish in the religions the history of which is known to us is *secondary*." The history of the Christianity of converted Finns and summarily baptized Russians is known to us, and we know that they were fetichists *before* they were Christians, and that they continue to be fetichists after their christening. In the religions of Greece and Rome we find fetichistic and magical practices like those which exist in Africa, Iceland, and Kamtschatka. These things are secondary in importance, not in order of development. These practices are in the background of Greek myths and religion. Why may not the Greeks and Latins, like the Russians before Christianity, have employed fetichistic charms before they knew of the Olympian gods, and kept them up afterwards? Nothing in the State religions of the old world discouraged the fetichisms and taboos of the superstitious man in Theophrastus's "Characters." Men could retain the rites which are now known to savages under Zeus, or Isis, or Dionysus, and could moreover invent new fetichisms of their own unrebuked. The ubiquity of an institution is in favour of its being primary, not secondary. The most ancient images of the Greek gods were rude, unhewn stones, or half-animal figures. What process of corruption or degradation acted alike on the Zulus, on the wild races of Peru before the Incas, on the Samoyeds, on the Portuguese, the Russians, the Romans, and the Greeks? That is what Mr. Max Müller has to show, if he wishes to establish his opinion. What was the more sweet and reasonable religion which Greece knew before the people of Phigalia worshipped the horse-headed Demeter, before the votaries of Artemis danced the bear-dance? what was the better faith of the Maoris before fetish stones were held in honour? what sublimer creed inspired the Samoyeds before they made sacrifice to blood-bedabbled dolls? and what similar process of corruption ruined the purer cults of Greeks, Maoris, and Siberians, and made them adore rubbish, and dance, in the guise of beasts, in face of bestial deities? The sad results are the same everywhere, as Mr. Max Müller admits. Corruption of religion ended in the same fetichism. The difficulty is to recover in fancy that happier time before fetichism, and to imagine causes so wide in their range, so identical in their result—causes which affected in precisely the same way the ancestors of the most civilized and of the most besotted peoples. On the hypothesis that, of the two, fetichism is earlier than nobler creeds, or at least is not later in development, the difficulty disappears. Men, as they advance in culture, advance—as a rule, and speaking very widely—in grandeur and purity of religious ideas; but they do not therefore wholly lay aside, nay, they often hug with superstitious eagerness, the old grotesque absurdities; even if they abandon them, they return to them. As to Mr. Müller's argument that the fetichist explains his fetiches by calling them "gods," and that therefore the idea of "god" is prior to the ideas which produce fetich-worship, it scarcely needs to be answered. How the fetichist now explains the practice which he inherits is not to the purpose. He explains all he does and all the world in one way or other. By this time the idea of "god" has been made familiar to perhaps every race, but who can argue thence that it was familiar to the first fetich worshippers? The conception of some such power as a fetich worshipper may now call "god," in some low sense or other, might even be evolved out of the contemplation of the magical attributes assigned to various separate fetiches. As to the basis of the magical attributes, that is to be found in the simple metaphysics and natural philosophy of savages. From this, that, and the other example of magical power, the notion of such power in the abstract could be evolved, and that notion again could be heightened into savage godhead, and that godhead conceived to animate individual fetiches. From missionaries, too, and Mahommedans the idea of "god" might be derived, and used to explain the adoration paid to fetiches, which may have been honoured before the explanation was dreamed of. Granting to Mr. Müller that no race is now exclusively fetichistic, his argument about the application of the term "god" to the fetich is answered at once. The higher conception (however attained, whether a result of teaching from without or of reflection on ghosts, shadows, dreams, and on the life ascribed to stars and to the sun) is now used to explain the lower practice. It does not follow that men had the idea of God when they first treasured fetiches—a statement which a remark of Mr. Müller's about the technically godless Aryans of India seems to force him to admit to be true (p. 197).

We have now examined Mr. Müller's definition of the subjective germ of religion, and his account of what the objective element in religion was *not*. The definition fails to satisfy, and the destructive arguments against the theory that fetichism was one of the earliest traceable elements in religion, not a corruption of religion, really seem rather to prove the opposite of what the lecturer intended to demonstrate. We have now to see what the sensuous outward objects were that did for the Aryans what fetiches did *not* do, that first awoke religion in them. Mr. Müller's third lecture is a masterly abstract of information about the ancient religious literature of India. It is from that literature that he derives his opinion as to the "sensuous impressions that first filled the human mind with a suspicion of the supersensuous, the infinite, and the divine." Yet Mr. Müller admits that "one can nowhere watch the first vital movements of a nascent religion" (p. 129). This being so, it is not for our present purpose of much importance that he does not find fetichism in the Rig Veda. "Tangible objects [which the fetichist adores] are hardly represented at all among the so-called deities of the Rig Veda. Stones, bones, shells, herbs, and all the other so-called fetiches are simply absent in the old hymns, though they appear in more modern hymns, particularly those of the Atharva Veda." We fear that other eyes might see other things in the Rig Veda; but, granting Mr. Miller's position, how are we any further advanced? The Rig Veda represents the highest religious ideas of a comparatively advanced civilization. Long before its hymns were chanted, before the Aryan race separated, the race was, comparatively

speaking, civilized. Its members were perhaps as far advanced as the Kirghis Tartars of to-day. Thus the Rig Veda only shows us what was the religion of a highly-gifted people, at a time when it had all the necessary appliances of civilised life. It cannot possibly show us what the remote ancestors of that people believed or practised. Again, it is necessary to ask, how did the charmed stones, bones, shells, herbs, and so forth, get into the later Atharva Veda and into modern Indian practice? How did the vast wave of "corruption," of fetichism sweep from Behring's Straits to Peru, from China to Ceylon, across the whole surface of the world, reaching India at a time which Mr. Max Müller must think comparatively definite, at a time between the date of the Rig Veda and of the Atharva Veda?

The recrudescence of fetichism in religion may be explained in several ways. On the hypothesis of inquirers who give it a place among the earliest germs of the sense of the supernatural, it never dies out, but clings to the ritual of even the Olympian gods, and is ever apt to become prominent, as religion, in one of the fluctuations of the human spirit, gives place to superstition. The history of unrevealed religion is one of ebb and flow; the ebb leaves bare the old desolate shores of faith, and men fall back on adoration of the "stones and shells" that the "moving waters in their priest-like task" had covered. Indeed the character of the priesthoods and temple fraternities of many an old religion was to cling to the savage mysteries that the lay world had outgrown, and, when a chance came, to reinstate them in a prominent place. It is by some such ebb in the "sea of faith" that people who hold the opposite opinion to that entertained by Mr. Max Müller explain the degradation of Aryan religion in India. They think that fetichism, with many other beliefs and practices, filled the countless years before the Rig Veda, that fetichism was almost hidden by the purer faith of the early Vedic times, and came to importance again, as various causes promoted superstition to the prejudice of religion. They cannot possibly say with Mr. Müller that there is no room for fetichism in the earliest documents of religious thought in India, "as little as there is room for lias *before* or within the granite." *Before* the Vedas, there is room at least for the change from a savage to a civilized society; and how can Mr. Müller hold that there is not room for the change from the rudest superstition to a cultivated religion?

We have treated the Hibbert Lectures controversially, because they naturally stimulate discussion, as indeed it is apparently the intention of their promoters that they should do. We must confess that Professor Max Müller's arguments do not carry us with them, that they raise more questions than they settle, and leave the "Origin of Religion" still unexplained. Their value as a popular exposition of the views of one of the most learned, accomplished, and genial of modern scholars, has been and will be widely, not to say universally, acknowledged.

SMITH'S LIFE OF COBBETT.*

It may be fairly said that the life of Cobbett was worth writing, and perhaps it is not going too far to say that Mr. Smith's Life of Cobbett is worth reading. But there is a good deal of hard work to be faced by the reader who sets himself to get through these two volumes. Mr. Smith found that he had selected a dreary piece of work, and thought he might console himself by adopting the style of a sensational novelist. What there really is to be said about Cobbett might be said within a very moderate space. The main events of his queer, adventurous life are soon run through, and were not inadequately summarized by Lord Dalling in his *Historical Characters*; but it is undeniable that a short story can be made long if the author knows how to manage his business. Sensational headings, ironical comments, notes of admiration, and comic digressions make a book long; and if Mr. Smith thinks they make it lively, he is not without the example of more elaborate writers to justify him. And in some respects he is a very suitable biographer for Cobbett. He honestly and thoroughly believes in the greatness and usefulness of Cobbett's work. He heartily admires Cobbett's character. He sees Cobbett's very eccentric mode of conducting himself in the best possible light. Unless it had been a labour of love it is hard to understand how any one could have persuaded himself to undergo the labour of collecting all the materials of a Life of Cobbett and of putting them together. On the other hand, he can see some spots in the sun. Cobbett is occasionally too absurd even for Mr. Smith; and so the narrative has not the wearisome character of an unbroken panegyric.

When it is said that Cobbett had the command of a style forcible, picturesque, and all his own, that he was never afraid of any one, and that he bearded the Government in bad times, and made a wonderfully good fight against oppression and corruption, all is said that can be said. He was very ignorant, very obstinate, very prejudiced, and very quarrelsome. In fact, he had the virtues and defects of a self-made man. The son of an agricultural labourer, and for seven years a private soldier, he toiled through English grammar until he not only mastered it, but lived to write the best grammar of its day. He acquired a fair knowledge of French, and had the honour of giving English lessons to Talleyrand when they were both in America. He attained a sufficient acquaintance with English history to compose a partisan account of the Reformation. All this is meritorious; but other self-made men have done more. What he had to distinguish him was the felicity of his style and the peculiar direction of his energy. In spite of its force and beauty, his style, however, has not sufficed to keep his books alive. The number of the readers of Mr. Smith's biography who have read, or ever will read, a page of Cobbett's voluminous writings must be very small. They are dead with the politics that begot them; and, if it were not for a few exquisite passages describing English rural life and scenery, Cobbett would not be known even by extracts from his works. The main direction of his energies was to plead the cause of the English poor. This was only the main direction; for, as he quarrelled with every one, he was nearly swamped in the floods of his gushing vituperation. But his chief work was to maintain that much ought to be done for the poor, and that the poor ought to do much for themselves. In carrying out this work he showed real originality. He was always trying schemes which he thought would make the nation richer and therefore the poor better off. He strove hard to introduce the planting of the locust-tree and the culture of maize. His *Political Register* was a perfectly novel kind of literature, designed to give the poor an education, and to let them know what was happening among the great, as well as to denounce those who, as he thought, were wronging them. He published his *Register*, with only one interruption for a few months in 1817, for more than thirty years, and he made at least one side of politics intelligible to thousands who would otherwise have known nothing of politics. In this sense it may be said, without exaggeration, that he gave an impetus to the progress of the nation. Among the elements of the change which led to the Reform Bill the influence of Cobbett's writings holds an undeniable place. His history, so far, makes part of the history of England; and no one can pretend to understand the condition of English society in the period from the Peace to the triumph of Lord Grey's Ministry who has not studied the career and the writings of Cobbett. In spite of all his absurdities and fallacies, there was something in what he was and in what he did which cannot be overlooked.

Cobbett was a socialist, although perhaps no other socialist has been exactly of the same type. Still socialists generally may be divided into those who look backward to an ideal past and those who look forward to an ideal future; and Cobbett belonged to the former general division. He had not a sufficient smattering of philosophy to appeal to that imaginary state of human society when the original contract by which the rulers and the ruled are bound together was at once understood and maintained. He lived long before the time when the study of ancient institutions had so far advanced that writers like M. de Laveleye can think they see the best hope for Europe in a revival of the system of tribal community. His ideal past was the past of the people of England. He claimed for the suffering labourers that they should have given back to them that of which they had been robbed. He inveighed against the odious spoliation by which the vast estates which the Church once held for the poor were cast into the lap of courtly adventurers. He maintained that the tithes originally belonged to the poor as well as to the parson. He insisted that Parliament was once intended to represent, and in point of fact did represent, all classes. Wherever he looked he found abuses, but he contended that they were the abuses of a good system. Corruption, pensions, military tyranny, Government persecutions, rotten boroughs, filled him with deep indignation, and afforded endless material for his facile pen; but all these bad things had come upon the country because bad men had got hold of power. England had been not only ruined, but changed, by an evil-minded oligarchy. To repair the ruin it was only necessary to sweep away the change, and to restore England to what England once was. He was always in profession, and probably in his real feelings, a steady loyalist. He had no jealousy of the Crown, and he held to the last that government by King, Lords, and Commons was the best government in the world. He was enthusiastic for the great war, and hated Napoleon with his whole heart. He never dreamt of attacking the Corn-laws, and was too much engaged in farming himself to object to the price of food being enhanced by protection. But he made up for this by opinions on the currency which were in those days what protection became to a later generation. He wanted a sufficiency of bank-notes to make things go smoothly, and actually, when he got into the House of Commons, proposed that Sir Robert Peel should be struck out of the list of the Privy Council for having proposed the resumption of cash payments. Naturally, with these opinions, he detested above all men the Whigs. They were worse than all; for they played with Reform, and so managed Reform, when they were forced to take it up seriously, as to do the poor no good, and give them nothing of what was their due. They seemed indeed to Cobbett to be of all his enemies the most pernicious, for they copied his ideas only to spoil them.

When the general outline of Cobbett's opinions is before us, it is difficult not to be struck with the substantial resemblance which they bear to the opinions shadowed forth in Lord Beaconsfield's novels. *Sybil* and *Coningsby* are a reproduction of the *Political Register*, touched with the hand of genius, and so given that it is impossible to say how far the new Cobbett believes in his Cobbettism. But, so far as Mr. Disraeli wrote to teach as well as to amuse, he was sitting at the feet of Gamaliel, and his Gamaliel was the vituperative farmer who had just passed away from Parliamentary circles before he himself entered them. The Venetian oligarchy, the beauty of monasteries, the affinity of the Crown and the

* *William Cobbett: a Biography*. By Edward Smith. 2 vols. London: Sampson Low & Co. 1878.

people, the existence of two nations in one country, the foundation of an aristocracy on spoliation, the magnitude of the rural interest, even our famous friend the Conservative working-man, are all to be found in the pages of Cobbett, although clothed in the coarse and humble garb with which alone Cobbett was able to invest them. Cobbett set himself to attain practical ends, while Mr. Disraeli set himself to change the spirit of the governing classes. Both had something really to teach, and both managed to inculcate useful lessons. Most of the abuses which Cobbett attacked have been swept away, if not altogether by the detested Whigs, yet under their guidance. The spirit of the governing classes has been changed, and Mr. Disraeli has contributed in an appreciable way to the change. To both very much has been forgiven in consideration of the services they have rendered. There was even something of similarity in their lives and their characters. Each started under enormous disadvantages, and yet even in those disadvantages there was something advantageous to them. Cobbett gained his knowledge of the poor in his own early home, and Mr. Disrael sucked in literature from the cradle. Both rose by audacity and sheer force of character. Both leapt into notoriety by vituperation, and made themselves feared in order to get a hearing. Mr. Disraeli, however, was so enormously superior in sense and knowledge of the world that the parallel cannot be pushed very far. Cobbett could never surmount the misfortune of being a self-made man. He had no perception of the ridiculous, and he had not the slightest notion of the profundity of his ignorance. But still Cobbett was the one original socialist of his day, just as Mr. Disraeli was the one Tory who could educate his party. It may perhaps be added that both have been more admired and listened to than trusted. Just as there used to be a feeling that no one could guess what the next number of the *Political Register* would contain, so even now there is a feeling that no one can guess what Lord Beaconsfield will do in the next Session. The comparison is of course only true within certain limits; but that the comparison is possible gives an interest to the career of Cobbett which may be pleaded as a justification, if any is needed, for giving a new biography of him to the world.

BEERBOHM'S WANDERINGS IN PATAGONIA.*

WE are not a little puzzled by the map with which Mr. Beerbohm illustrates his journey in Patagonia. When we measure the distance he travelled by the scale of miles that he gives, we find that he went at least one thousand miles. But when we estimate it by the degrees of latitude we find that he went at the very outside four hundred. According to his scale, one degree of latitude is equal to about two hundred miles. The blunder, however, may not be Mr. Beerbohm's. It is nevertheless certainly surprising that when he inspected the map—for we may assume that he did inspect it before the book was published—he failed to discover the mistake that had been made by the designer. A man who went through all the hardships that Mr. Beerbohm encountered as, partly on horseback and partly on foot, he made his way from Port St. Julian to Sandy Point, would have had, we should expect, a sharp eye to the distances. Every one who has made a walking tour even in our own country knows how carefully he calculates by his map the distances he has travelled, and how alive he would be to any very gross blunder. But what are the hardships that a pedestrian can meet with in England when compared with the dreadful risks and the sufferings to which for many days Mr. Beerbohm was exposed? It is difficult to account for the mistake, though likely enough a satisfactory explanation can be furnished. We are also scarcely less puzzled by the length of the summer night in these latitudes. The author happened to arrive at Sandy Point on the Straits of Magellan the day before the revolt of the Chilian convicts. He describes the events of the night of November 11th, which we may take as corresponding to that of May 11th in England. Sandy Point is nearly two degrees further from the equator than London, so that its night in summer would be rather longer than ours. He describes himself as waking about midnight, getting up and looking out at the weather, and then lying down again for an hour. This would take him to one o'clock. He was then roused by some fugitives who were seeking shelter and rest. He received them, heard an account of their adventures, provided them with tea, and managed to make up some beds for them. They retired to rest, while he and his comrade sat up consulting as to their plan of action. In the midst of their discussion two other fugitives came in, who sat down and joined a Scotchman who was present in drinking whisky. We can scarcely assign less than an hour to these occurrences, which brings us to two o'clock. Next, a body of drunken soldiers, who had mutinied and joined the convicts, burst into the house, and for two hours kept the author in the greatest anxiety lest they should discover the fugitives. At last they left. This takes us to four o'clock. He at once ran to the fugitives, and told them that they had better leave the house and fly to the woods. When they went out they found that "it was raining, and the night was as dark as could be." Now on May 11th the sun rises at London at about a quarter-past four. On November 11th in the latitude of Sandy Hook it would rise rather earlier. But, even if we allow that the author was an hour wrong in his calculations, yet, even at three, the night certainly was not as dark as could be, for the would have appeared. Mr. Beerbohm may probably answer that it is unreasonable to expect that a man who has encountered such risks as he went through should be accurate in the account he gives of the time. We are willing to admit that there is some force in the excuse, and will therefore, without any further delay, give a short account of his journey.

His narrative is, on the whole, lively and interesting. His style is at times too high flown, and now and then is disfigured by errors in the use of words. He uses lay down for lie down, and reliable for trustworthy. We much doubt whether a horse can be properly described as impervious to fatigue, and we do not see why sea-captains and rude Indians elect to take a certain course, instead of making up their minds or choosing. Elect sounds well enough in a novel, but in a coasting-voyage or in a scamper over the Pampas the simpler word seems more natural. The same may be said of "the caloric of our bodies." Warmth would surely have expressed everything that the author wished to say. If, however, when he is telling how he heaped up a fire to keep himself warm, he wishes to use so learned a term as caloric, we would advise him to have the whole expression in keeping. He must surely elect—to use one of his favourite words—between warmth of the body and corporal caloric. We now and then doubt whether he attaches any very precise meaning to the term that he uses. For instance, in describing the current of a river he says, that "it darted about capriciously without apparently depending on any topographical influences." It is difficult to see how the current of any river can depend on influences that are descriptive of a place, whatever they may be. However, happily for our author, the readers of the present day are so used to a constant interchange in the uses of words that they are not likely to be troubled by such trifling inaccuracies as these. So long as a word is evidently derived from the Greek, it is always in good credit in whatever company it may be found. In spite, therefore, of these little drawbacks, Mr. Beerbohm's narrative will, we have little doubt, be found interesting. He was one of a party that started in the month of August in last year to survey a portion of the coast of Patagonia. They landed at the desolate harbour of St. Julian, which remains in just the same state as it was found by Magellan, and later on by Drake. Drake indeed had discovered one mark of civilization, for there was still standing a gallows which Magellan had set up more than fifty years earlier. But even this one trace of civilized life had no doubt long disappeared before the surveying party from Buenos Ayres arrived. Mr. Beerbohm did not remain many weeks with them, for he received letters which required his immediate return. There was no chance of a vessel calling at St. Julian, and he therefore resolved to go overland southwards to Sandy Point, on the Straits of Magellan, where the steamers from the Pacific touch. He joined a party of ostrich-hunters who were making for that port. The chief of the party was an Argentine Guacho, with a dash of Indian blood in his veins. His life had been a strange one. He had served in the Argentine army, had deserted and run away with a tribe of Indians, had lived among them for a time, and at length had left them and had taken up his present life. He owned no less than thirty horses, which he drove along with him wherever he went, and, though he had no house of any kind, yet was looked upon as a rich man. The second was a man whose "yellow beard and blue eyes seemed to betoken a Saxon rather than a Spanish descent." He also had been a soldier in the Argentine army, and had taken part in many a fight with the Indians. The third was a Frenchman who had been a blacksmith, and who had formed part of the garrison of Belfort when it was besieged by the Germans. His appetite was enormous. "I have known him," says the author, "eat six ostriches' eggs in the space of eight hours, independent of his ordinary meals." The fourth and last was a young Austrian sailor who had been wrecked on the shores of Patagonia. He was as distinguished by his learning as the Frenchman was by his appetite; for he was "an accomplished linguist, and spoke Spanish, Italian, French, German, and English with tolerable fluency." What was the language that, as being his own, he spoke with considerable fluency we are nowhere told. There have been those who imagine that there is an Austrian language, but it is most improbable that our author is one of these.

Such was the party with which he started on his long journey. They had about fifty horses and a pack of dogs. Each morning they chose a fresh horse, catching him by means of the lasso. As they rode along they were always on the look-out for ostriches, which supplied them both with food and with feathers to trade with. They had no adventures of any great moment till they reached the banks of the river Gallegos. This they found so swollen by the floods that it was hopeless to venture to cross it. Their provisions were almost exhausted, and, though they could always procure meat, yet it was so lean that by itself it was scarcely sufficient to support life. They had no tent with them, and there was not even a bush to afford them shelter. Hour after hour they sat exposed to a cold rain-storm trying to warm themselves at a fire which gave out little heat but a great deal of smoke. They rode up the river and down it to try different fords, but all to no purpose. One night there was a heavy fall of snow, and they woke up to find themselves covered by it. At length their provisions were exhausted and they had nothing to depend on but what they caught by hunting. Weary of the delay Mr. Beerbohm and the Frenchman resolved, in spite of the warnings of the others, to try to cross the river on their horses. They made

* *Wanderings in Patagonia; or, Life among the Ostrich Hunters.* By Julius Beerbohm. With Map and Illustrations. London: Chatto & Windus. 1879.

more than one trial, but without success. They were both nearly drowned. Mr. Beerbohm, in fact, was swept from his horse and was saved by catching hold of a valise which was strapped to its back. They then parted company with the others and rode sixty miles off to another ford, which "for topographical reasons" they thought more favourable for their purposes. They resolved to make another attempt by driving their horses before them, and then swimming over themselves. They took off their clothes, and wrapped them up with all the rest of their goods in their cloaks. These they strapped on the horses' backs. If the horses reached the opposite shore their masters would be forced to follow, as, stripped of their clothes and exposed to a strong wind that brought hail and snow, they could not have lived many hours. The rashness of the attempt almost passes belief. Mr. Beerbohm was, he says, most anxious to catch the next steamer, and was utterly weary of his diet. These reasons, strong though they may have been, were scarcely sufficient to justify two men, worn out with exposure and poor food, in running such risks. Their first attempt failed, as the horses were carried back by the force of the current. They passed some more days in this miserable state, and got still weaker. At length they made a second attempt. The horses crossed over and so did the Frenchman. Mr. Beerbohm was swept back to the shore whence he had started. He managed to get to the fire which they had left, and there warmed himself up for another trial. This time he got over safely. But their dangers were by no means over. The next night they lost their horses and had to make their way through the wilderness on foot. Happily in a day or two, when their strength was almost spent, they fell in with Indians, and got food and horses to continue their journey. They might well have thought they had gone through dangers enough, but fate had not yet done her worst. The very night of their arrival at Sandy Point the convicts rose, burning the town and murdering the inhabitants. Our author had a narrow escape, and only saved himself by hiding in the depths of a forest till a steamer arrived and took him off. After such adventures as these it is scarcely surprising that, when a friend asked him whether he would care to go again to Patagonia, he answered, shuddering, "By Jove; no!" He must remember, however, that neither rivers nor convicts are always rising, and that, if he were to make a second journey, he might likely enough not even have a chance of getting drowned, frozen to death, or murdered. In that case, however, his narrative would be wanting in those exciting scenes which will recommend the present volume to not a few readers.

KERNER'S FLOWERS AND THEIR UNBIDDEN GUESTS.*

A NEW and inviting field was opened to botanical research by the publication, in the year 1862, of Mr. Darwin's book on the fertilization of orchids. The striking and suggestive series of facts and generalizations brought together in that work assigned to flowers a sphere of operations in nature hardly dreamt of before, and capable of boundless expansion. Not only are flowers fitted to administer delight to the senses through their beauty and fragrance, but they are shown to fulfil a function of direct and vital utility in the vegetable kingdom of which they are the ornament. Assuming the primary design or tendency of all organic life to be that of self-perpetuation, we must needs attach the utmost importance to all those processes or appliances in nature which concur towards that end. The maximum of fecundation may be said to be the ideal goal towards which nature seems to strive, whilst no less varied and boundless are the agencies she seeks to press into her service. Among the main conditions of progress is found to be the more or less frequent intercrossing with fresh and independent forms of life. A mass of observations has made good Mr. Darwin's broad generalization that nature abhors perpetual self-fertilization. This principle holds no less in regard to plant-life than does that of a new strain in the experience of the breeder of animal stock. What can there be, then, of more importance or interest in the eyes of a physiological botanist than to trace out those appliances which can be shown to exist in the vast majority of flowering plants for securing a more or less varied intercross among them, and for excluding as far as may be the possibility of self-fecundation? Such is the aim proposed to himself by Dr. A. Kerner in the admirable little work lately issued here in an English form by Dr. W. Ogle, prefaced by a commendatory letter from Mr. Darwin, who, while thinking it possible that some of Kerner's generalizations may hereafter require to be modified, expresses a high conviction of the value of his work. Dr. Ogle, who has brought to the task of editor a sympathetic feeling for the same pursuits, makes mention of a kind of anticipation on his own part of the leading principle of Dr. Kerner's researches. Nearly three years ago he had been impressed with the fact that the stem of Lychnis Viscaria was encircled with a ring of sticky secretion, which he at first thought might serve as a trap for small insects, to be digested and absorbed as food. The insects failing to be thus disposed of, he was led to the inference that the end subserved was to keep off such insects, especially ants, as were too small and weak to effect cross-fertilization. Propounding this hypothesis to Mr. Darwin, he was told that the evidence was not yet sufficient for proof. Before he had time for the accumulation of further evidence, Dr. Kerner's essay made its appearance, which verified on a wider scale the theory he had presaged, and of which he set himself to give the benefit to the English public. The thesis, though new, is, he truly allows, a branch of the tree planted by Mr. Darwin, yet foreshadowed curiously enough in the *Loves of the Plants*. The grandfather of our great naturalist, while ignorant of the true relation between insects and flowers, had noted the function of one of the appliances described by Dr. Kerner—water-cups formed by the connate leaves of the teasel for the protection of its nectar. Still more decided is the reference by Mr. Belt, in his delightful work on Nicaragua, to the contrivances possessed by many flowers for preventing useless insects from obtaining access to their nectaries, admitting those alone which subserve the purposes of cross-fertilization by means of the pollen they introduce. In these anticipations we see so many special lines of thought radiating from the central idea of natural selection, illustrative of the preservation of advantageous varieties in nature. To work out this principle as it seems to explain a large class of provisions for the fecundation of plants is the task which Dr. Kerner has set himself in his interesting essay.

Such terms as "self-fertilization" are, as the author premises, to be avoided for their extreme indefiniteness. He would substitute "autogamy," to express the fecundation of a flower by the pollen from the androecium of the same flower; "geitonogamy" for the fecundation of a flower by pollen from other flowers on the same plant, and "xenogamy"—coming with the last-named class under the common title of "allogamy"—for the fecundation of a flower by pollen from other plants. He goes on to show the functional significance of the various parts in relation to these several processes, pointing to the accumulation of functions in parts morphologically identical which may determine the endless multiplicity of their forms. Not that he would pretend fully to explain hereby how that multiplicity originated, or what was its primary state. That question, with the further one—why plants in general produce flowers and fruit, instead of remaining limited to the vegetative mode of reproduction?—he considers outside the present inquiry. He starts with the assumption that the sexual mode of reproduction by periodic flowers and fruit is advantageous to every plant, finding as it does a possibility for the origination of new individuals differing in external character from the parent plant, and thus giving rise to new specific differences, advancing in type. It will be found, he contends, that the position, direction, and shape of the leaf, perianth, or other parts of the plant, are of no less significance for the preservation or advancement of a species than the form, colour, or smell of a flower; and that no hair or bristle is meaningless, whether found on the cotyledon or the leaf, on the stem, or the blossom. Enough has been done to establish the relation which subsists between the parts of the flower and the insects which visit it, as well as the manifold ways in which the pollen is distributed by these visitors in the course of their flying or creeping elsewhere, and the means whereby the pollen is protected from premature disposal through waste or frost or wet. But there are many peculiarities of shape presented by flowers which are not to be explained by reference to this formation. There are visitors whose invasion would be injurious in manifold ways, and it is to the means devised by nature for the exclusion of these unbidden and unwelcome guests that our author draws attention. A simple group of bristles or prickles in any part of a leaf or stem that has to be traversed by a snail, caterpillar, or other soft-bodied insect will put an effectual stop to its getting into the flower. The wingless aphides, which, if placed upon the perianth or other part of the flower, greedily thrust their rostrum into the rich juicy tissue, are hopelessly disconcerted by bristly or prickly leaves and stems, over which chitinous insects in their horny armour march with perfect ease. Now it is precisely among these chitinous insects, Dr. Kerner remarks, that many species are to be found whose visits would interfere very prejudicially with the functions of some or other of the parts of the flower:—

> For in most cases the bodily dimensions of such creatures are not adapted to the general conformation of the flower; that is, their dimensions are so small that, in diving into the recesses of the flower for the nectar there secreted, they would touch neither the anthers nor the stigma. The result therefore of their visits would be that not only would the allurement, that is, the nectar, be taken away from those insects which possess bodies of a suitable size, and thus the advantage be lost which attaches to the visits of such invited guests, but that a further evil would ensue, inasmuch as these little unbidden guests would fill up the bottom of the flower, and so cause a mechanical hindrance, which would prevent the larger and welcome insects from pushing their trunks to the bottom of the nectaries.

Most insects that are armed with mail of chitin are winged, and, if vegetable feeders, reach the flowers by flying. Some of them, however, are wingless; and these, like the snails, have to crawl over the axis and leaves to the flower. Now the visits of these wingless insects are disadvantageous, even if they possess such size of body that, in pushing to the bottom of the flower, they would rub in due succession against the pollen and the stigma. For, even when they leave a flower laden with pollen, such insects have a long journey before they can climb up to another flower of the same species, during which the pollen may be rubbed off by leaves or stems or hairs, or be washed off by weather. Nor is it likely that the flower which it reaches with difficulty will be in most cases exactly suitable for its reception; whereas the winged insect flits

* *Flowers and their Unbidden Guests.* By Dr. A. Kerner, Professor of Botany in the University of Innsbruck. With a Prefatory Letter, by Charles Darwin, M.A., F.R.S. The Translation Revised and Edited by W. Ogle, M.A., M.D., sometime Fellow of Corpus Christi College, Oxford. With Illustrations. London: C. Kegan Paul & Co. 1878.

readily from flower to flower with its load of pollen fresh upon it, generally carrying on its visits to a succession of flowers of the same species. This latter propensity, Dr. Ogle remarks in a note, has been observed by Aristotle in the case of bees, which are wont to restrict themselves during one expedition to a single species of flower, such as the violet. The editor has himself during his Alpine rambles been struck by seeing Bombus montanus visiting only the inconspicuous flowers of Anthyllis alpestris, passing over the numerous and far more conspicuous nectar-bearing flowers of Pedicularis Jacquini and P. incarnata. It may well be to keep off such insects as are wingless, and to allow access to those only which fly, that flowers of very small size—flowers, *i.e.* in which very tiny insects, in pressing forward to the nectariferous recesses, would necessarily come into contact with the anthers and the stigma (such as many Compositæ, Cruciferæ, Caryophyllaceæ, Saxifragæ, Asperifoliæ, &c.)—are provided with defensive appliances in the way of bristles and hairs. Of all the wingless insects, the most unwelcome guests to flowers are the widely dispersed ants, which yet are the very ones with the greatest appetite for nectar. Curious experiments, on the part both of the author and editor, attest and illustrate the fact of ants smelling saccharine fluids at considerable distances. When deprived of protection, either by accident or artificial means, nectariferous flowers, such as Melianthus, will be found swarming with ants, though in their natural state or position they are effectually protected from these inroads during the critical period of inflorescence. In Phygelius capensis all access is rendered impossible to ants during the period of flowering; but no sooner has the corolla detached itself from the torus than the nectar, of which there is still an abundant store, is accessible to the greedy insects. The flowers falling off, their nectar is useless, being no longer needed to attract such flying insects as cause intercrossing.

In the description accompanying the admirable plates at the end of his book, Dr. Kerner explains succinctly and clearly the contrivances of nature in the instances named, and in innumerable others scarcely less marked or interesting, for compassing an end so essential to the perpetuation of vegetable life. In some cases, as in Knautia dipsacifolia, the stem is seen beset with bristly hairs, which effectually keep crawling guests away; in others, as in Linnæa borealis, the calyx and bracts are covered with glandular trichomes, of which ten rows highly viscid are set on the calyx of Plumbago europæa. In Gentiana verna the aperture of the flower is seen to be closed by eight fringed epiblastemes. Symphytum officinale shows a pair of stamens alternating with two prickly epiblastemes. Several gentians and campanulas, which our author somewhat fancifully terms revolving flowers, have nectaries with their throats so contracted and so deep that only a slender and lengthy proboscis can effectually penetrate them, which implies an insect of superior size. Nigella is closed with a lid which he has observed ants strive in vain to lift up, but which bees can raise with perfect ease. In the snapdragons and allied plants a swelling of the lower lip of the corolla so closes the entrance to the flower that it requires a muscular insect to force a passage. Through these and other instances without number Dr. Kerner traces the operation of a beneficent law or provision whereby nature keeps guard over her treasures, and works in furtherance of that end of progressive fecundity which all observation shows to underlie her efforts.

PAUL FABER, SURGEON.*

Of all kinds of novels the religious novel is apt to be the least desirable. There are a certain class of people who will read it and no other kind, much as they will go to see a play performed at the Crystal Palace by the same actors whose representations they would refuse to witness in a London theatre. Fiction in a general way is to them a thing to be avoided; but a book which combines the pleasure of invention with the flavour of a sermon may surely be read with a clear conscience. When such books, written, as no doubt some of them are, with sincerely good intentions, contain nothing absolutely offensive, people who think them mistaken in point of taste will not be inclined to blame their authors with great severity. We do not presume to inquire with what precise intentions Mr. MacDonald may have written *Paul Faber, Surgeon*, but we do presume to say without hesitation that there is much offence in it.

To criticize such a production as being a work of art in any sense would be hopeless, if not ridiculous, and it is a matter of comparatively small importance that Mr. MacDonald's style is of the most irritating kind, especially when, as in his opening chapter, he indulges in what he probably regards as a vein of gentle humour. In this chapter "Paul Faber, Surgeon," is introduced to us as making a reckless leap on a big horse into a road, where he meets the carriage of Mr. Bevis, Rector of Glaston. The rector upbraids him for his foolhardiness, and "'It is but fair to give my patients a chance now and then,' returned the surgeon, who never met the rector but there was a merry passage between them." This merry jest is capped by the rector, who timidly makes a feeble joke about Death in the Revelation, and finishes his speech with this pleasant sarcasm:—"How many have you bagged this week?" We feel inclined to say with Dr. Johnson—"This merriment of parsons is mighty offensive." Mr. Faber, however, is just such another gay wit as the rector, and, by way of being revenged, presently says that, if he did get killed, it would be "but a knock on the head and a longish snooze." It may be noted that the surgeon, who is represented as being the soul of honour, although an infidel, prefaces this saying by telling what afterwards turns out to be something not unlike a deliberate falsehood. Presently we hear of a mysterious patient of the doctor's (he is called indifferently doctor and surgeon throughout the book)—a beautiful woman who has lately settled in Glaston, and about whom nobody knows anything; and we are then introduced to an "old minister," Mr. Drake, whom Faber, anxious to prescribe for him, goes to visit, but who refuses to accept any advice or help from an infidel. He puts his refusal in this way:—"Do not take it ill. You prize honesty; so do I. Ten times rather would I cease to live than accept life at the hand of any enemy to my Lord and Master." Faber is not the only man upon whom some of the pious people of Glaston look with disfavour. Some members of the Church of England regard Mr. Wingfold, the curate, with almost equal horror on account of the tone of his sermons. Mr. Wingfold is a person remarkable enough to deserve some special notice. He had the odious habit of scribbling verses of appalling balderdash on the leaves of his favourite books. On a blank leaf of *Othello* he wrote:—

> In the hot hell o'
> Jealousy shines Othello,
> Love in despair,
> An angel in flames.
> While pure Desdemona
> Waits him alone, a
> Ghost in the air,
> White with his blames.

With a better purpose he was accustomed to write verses as soon as he had delivered a sermon, in order that he might forget it. He spent the morning in his study on the day when we first see him, and when his wife knocked at the door, after three times coming to it and finding it locked, he

> came to her pale-eyed, but his face almost luminous, and a smile hovering about his lips; she knew then that either a battle had been fought amongst the hills, and he had won, or a thought-storm had been raging, through which at length had descended the meek-eyed Peace. She looked in his face for a moment with silent reverence, then offered her lips, took him by the hand, and, without a word, led him down the stair to their mid-day meal.

When that was over, this excellent woman devoted herself to reading him to sleep, and, when he woke up, to "extemporizing and interweaving" on the piano while he got the germ of his sermon, which, with playful humour, he called his germon, "ready for its growth in the pulpit." But this was not the limit of Mrs. Wingfold's devotion. Mr. MacDonald tells us that he was once present when, having ventured to make a perfectly just criticism on some remark of her husband's, she crept to his knees, and implored his pardon. "I will not tell any more of it," he observes, with touching *naïveté*. "Perhaps it is silly of me to tell any, but it moved me strangely." Mr. Wingfold's sermons, of which three are quoted at length, were not less remarkable than Mr. Wingfold himself. Upon the first one of his congregation makes what seems to us the perfectly just comment:—"Not content with talking about himself in the pulpit, he must even talk about his wife!" The rector, however, who had heard his curate preach for the first time, was moved, to begin with, to pour himself out a large glass of sherry, which he drank in three mouthfuls; afterwards, to reflect that "he had not behaved like an honourable gentleman to Jesus Christ"; and, thirdly, to offer to change places with his curate.

However, any detailed consideration of Mr. Wingfold's eccentricities—among which were an objection to the consecration of churches and a belief in "what they so absurdly call spontaneous generation"—would lead us too far away from the main plot, if plot it can be called, of Mr. MacDonald's production, which depends on the fortunes of Paul Faber and his mysterious patient Miss Meredith. He thought it well to bleed her to relieve an attack of pleurisy; and although, when he saw her arm, he "felt his heart rise in his throat at the necessity of breaking that exquisite surface," the operation was perfectly successful; and, when it was over, "'Thank God,' he said involuntarily, and stood up. What all that meant, God only knows." In the night, however—which, by the way, seemed to Faber to have "lost the blood he had caused to flow"—the bandage slipped off, and he found his patient in a dying state from loss of blood. Upon this, with singular ingenuity, he performed the operation of transfusion from his arm to hers with the aid of a syringe and some hot water, and so brought Miss Meredith back to life. He sat watching her during the night, and she, waking for a few moments, took him for a divine vision. Then he went away, and "presently Mrs. Puckridge brought her some beef-tea." Before very long Faber was desperately in love with his patient, about whom he was in some ways puzzled. "For one thing, while he had observed that her under-clothing was peculiarly dainty, he had once or twice caught a glimpse of such an incongruity as he was compelled to set down to poverty." They talk feebly together about poetry and religion, and at last he declares that he loves her. "As a man may," she rejoined with scorn. "No! such love as you can give is too poor even for me." Not the less for this does Faber go on dancing attendance on her, until, to quote his own words, "I mistake symptoms, forget cases, confound medicines, fall into incredible blunders," a state of things which must have been decidedly annoying to his patients. Before Miss Meredith finally consents

* *Paul Faber, Surgeon.* By George MacDonald, LL.D., Author of "David Elginbrod," "Robert Falconer," "Alec Forbes of Howglen," &c. &c. 3 vols. London: Hurst & Blackett. 1879.

to marry Faber various things take place. Among them is a scene of violence between Faber and an assistant of his who has been practising vivisection on his own account. How it happened that the assistant was able to secure his victim and operate upon it without Faber's finding it out until it was too late to stop it—whether, as one might think from the quotation just given, from Faber's gross carelessness or from his own diabolical cunning—Mr. Mac Donald does not condescend to tell us. However, Faber kicks his assistant downstairs, and turns him out of doors. This he was perhaps justified in doing, but Mr. Mac Donald has not strengthened the character of the puppet which he holds up for our admiration by putting the most horrible language into its mouth, and making it in the heat of passion talk the most vulgar English. Nor has the incident any result, except to serve as an excuse for introducing the second of the three sermons which Mr. Mac Donald includes in the pages of his novel.

It is time, however, to get to the chief point of Mr. Mac Donald's work. After Miss Meredith had become Mrs. Faber, she was not wholly contented with her life. Her grand piano had not yet arrived, and she wished her husband would buy a yellow gig and take her with him in it on his rounds. She borrowed a pair of goloshes and went to hear Mr. Wingfold preach a sermon in which he announced his belief that some day a strength of physical light would be found that would make gold or marble transparent, and one night she confessed to her husband that she had been no better than she should be before her marriage. Upon this ensues a scene which, whatever else it may be, is certainly unparalleled in the pages of modern, or for that matter ancient, fiction. Faber not unnaturally rushes away from her "with a great quick stride," and takes refuge in his dressing-room. Thither she followed him, and "sank on her knees before him, hurriedly slipped her night-gown from her shoulders to her waist, and over her head, bent towards the floor, held up to him a riding-whip." "They were baleful stars that looked down upon that naked world beneath them," says Mr. Mac Donald, and, going on to say that nothing is to him "so utterly pathetic as the back," he indulges in a burst of disgusting nonsense which it is as well not to quote. Mrs. Faber implores her husband to whip her, and so, as she puts it, make her clean. He is so far overcome by her entreaties that he takes the whip from her hand; but he does not use it. Mr. Mac Donald says, with bitter irony:—

> Of course a man cannot strike a woman! He may tread her in the mire; he may clasp her and then scorn her; he may kiss her close, and then dash her from him into a dunghean, but he must not strike her—that would be unmanly! Oh, grace itself is the rage of the pitiful Othello to the forbearance of many a self-contained, cold-blooded, self-careful slave, that thinks himself a gentleman! Had not Faber been even then full of his own precious self, had he yielded to her prayer or to his own wrath, how many hours of agony would have been saved them both!—"What! would you have had him really strike her?" I would have had him do *anything* rather than choose himself and reject his wife: make of it what you will.

What follows is even more nauseous than what has been quoted. In the end "the devil and the gentleman had conquered," and Faber left his wife and the whip. Many of the absurdities and even vulgarities contained in Mr. Mac Donald's novel offer themselves as fair marks for ridicule; but so gross and defiant an outrage as this upon the common laws of literary decency must be driven, not laughed, out of court. To serve this purpose it is probably enough that we have given our readers a sketch of the scene, leaving unquoted some of its "realistic" details. The story of subsequent reconciliation can hardly interest them.

DIGBY'S FAMINE CAMPAIGN IN SOUTHERN INDIA.*

IT was said by at least one eminent lawyer that Lord Campbell's habit of writing legal biographies had given a new terror to death. In like manner we may say that Indian famines are in themselves terrible things, but that, if described on Mr. Digby's scale, they will be invested with a yet deeper horror. The author of these two volumes has devoted more than a thousand pages to what he terms the campaign against the famine, and he has been aided in his task by endless reports and orders made public at the time, and by copies of private and trustworthy documents. He has had experience as an editor of a local journal. He acted for some time as Honorary Secretary to the Indian Famine Relief. He has the advantage of knowing exactly how men thought and acted at a very trying crisis. And we do not lose sight of the fact that his object is not so much to write a history of the famine as to put records into such shape that some future writer may found on them a trustworthy judgment. We do not expect to find, and we do not here find, errors in geography or politics, or in the spelling of Oriental names; nor do we complain of any general ignorance of the framework and machinery of the Indian Government. On the contrary, it is not often our lot to read a work in which, if we once admit the propriety of its proportions, there is so little to correct or revise. What we object to is that Mr. Digby has allowed himself to be swamped by his own materials. He has attempted to analyse them, but they have fairly mastered him. The art of condensation, of picking out startling facts, of eliminating what is ephemeral and retaining what is permanently useful, and of forming sound conclusions, seems to have been lost. We light on long controversies, which leave the matter all but undecided; telegrams relating to purely passing and unimportant topics; lists of names that no one wanted; minutes and arguments set out in all but their original bulk; a reprint of a piece of mock legislation, intended for satire, but neither witty nor amusing; and, in short, to borrow a phrase from one of Mr. Ruskin's earlier writings, we miss the skill that brings materials to point and accumulation into structure.

Still it would be unfair not to recognize the extreme pains bestowed on the work; the amplitude of the stores which throw light on the past as well as suggest thought for the future; the general fairness of the statements, with one or two exceptions to be noticed; the arrangement of copious statistical tables about rations, areas, population, and death-rates, and the moral earnestness and humane sentiments of the writer. All we say is, that compression and subtraction would have reduced the matter by one-third, and might have given the book a much wider circulation. There can be no question that the famine of 1877 distanced all others with which we have been made practically familiar. During other similar visitations within the last forty years, our attention has been directed exclusively to the North-West Provinces; or to the Rajpoot States; or to the Province of Orissa; or to Tirhoot and a few other districts in Behar and Bengal. But here we had a failure of crops which affected from fourteen to sixteen districts and sixteen millions of people in the Madras Presidency, which devastated a part of the kingdom of Mysore, and which spread dismay in the city of Bombay and misery over a large tract under that Government. At this very same time there was also distress in Rajpootana, and temporary but severe suffering in several parts of the North-West Provinces. Mr. Digby is not guilty of exaggeration in saying that the Viceroy, during his politic and humane journey from Simla to Madras in August 1877, passed through "a region almost entirely famine-stricken." Never, perhaps, has the Indian Government had to grapple with such a problem, and those who write with a vivid recollection of Afghan disasters, Sikh campaigns, and mutinies of Sepoys, must admit that to meet such an enemy with success would have severely taxed the forethought and sagacity of Lord Dalhousie and the serene and stately intellect of Lord Canning.

It is to be hoped that certain definite canons will be adopted and laid down for future guidance from the treatment followed in Madras. At the commencement of the campaign, administrators in spite of previous lessons seemed to be yet discussing the first principles of strategy. Mr. Digby enters at length into these controversies, and his narrative tends to establish the following conclusions. The problem which the Madras Government had to solve, and which other administrations may at any time have to encounter, was "how to feed an uncertain number of people on imported food for half a year at least." To this end it was proposed to employ and pay labourers on public works of utility; to establish vast camps under regular supervision where the sick could be treated medically, and those who could work at all might find occupation; and to administer relief in the villages to such as would not or could not travel to find it. But it very soon became apparent that petty works, carried out under the ordinary civil agency of the country, were both impolitic and unproductive. It was difficult to get a fair day's work out of the ordinary labourer; peculation and rascality were rife; and, worst of all, the works themselves were fragmentary, disjointed, and often unfinished. They were liable, when the famine was over, to remain as records of spasmodic action and wasted funds. The true policy is to begin a series of comprehensive or connected undertakings of permanent utility, and to entrust their construction to professional engineers, who shall take care that none but the able be employed, and that they be paid regularly in money for a fair day's work. But it is obvious that even such well-planned schemes afford no help to the sick, to the weak, to women and children, to that large class which during such calamities is given to wander all over the country, and to that still larger class which from ignorance, fatalism, or prejudices of caste prefers to remain till death overtakes them at their own homes. It was determined to provide for all such cases by the establishment of relief camps and by house-to-house visitation in the villages. The best idea of a model relief camp is to consider it as a workhouse and a hospital combined. The sick are tended; those able to do some work are set to tasks commensurate with their strength; sanitary measures are enforced, and cooked food is given instead of wages. In such a camp, furnished with kitchens, store sheds, hospitals, and all conveniences, and with a proper establishment of cooks, scavengers, policemen, carts, and a superintendent, relief can be given daily to several thousand people. But it is also quite clear that, without the strictest supervision, abuses creep in of all kinds in the reception of improper people and in the spending of money; and that it requires firmness and method to form a model camp. There remains the system of village relief. Nothing, at first sight, seems more humane and proper than this plan of visiting the homes of people too sickly to work or to go to a camp at a distance; and yet nothing has been productive of more heart-breaking waste. The curse of Indian administration, the untrustworthiness of native instruments, was never more clearly shown. Englishmen could not be had in sufficient numbers for such duties, and every Anglo-Indian of any experience knows what he has to expect when considerable sums of money must pass through sub-Inspectors, village Headmen, highly respectable householders, and venerable and orthodox Brahmans. Mr. Digby gives plenty of instances of the tricks and subterfuges resorted to by native agents. Money was

* *The Famine Campaign in Southern India*, 1876–1878. By William Digby, Honorary Secretary Indian Famine Relief Fund. 2 vols. London: Longmans & Co. 1878.

given to friends and relatives, and was withheld from the starving and the sick. Fictitious names were entered on the register. Some who were dying were left to die, while others who ought to have been sent to relief works or to an organized camp were comfortably supported at their own homes. Professional and religious mendicants came in for an undue share. In short, it has been abundantly proved that village relief, unless it is combined with rules that cannot be evaded or administered by people above suspicion, is another name for profligate waste of money.

It is to the credit of the Viceroy that he discerned the true principles on which the famine was to be fought; that he removed incapable and obstructive Anglo-Indians, and replaced them, in more than one instance, by men of tact, experience, and firmness; and that he strengthened the hands of the local Government by directing that all operations should be carried on by the Governor without the aid or interference of his Council. When correct principles have once been settled, execution is best entrusted to one man. Some little soreness seems to have been created by an apparent reluctance of the Government of India to admit that private charity was needed. But, after some correspondence, the proper sphere of individual and unofficial benevolence was seen, at first in Mysore and afterwards elsewhere. To compare small agencies with great, the distinction was exactly that which the members of the Charity Organization Society have drawn between their own sphere of action and the Poor Law. It has been a sore puzzle to many well-meaning English gentlemen and ladies, but it is essentially sound. It would be as absurd for the Committees of the Charity Organization to compete with the Guardians of the Poor in relieving destitution and pauperism as it would have been for the Indian Famine Relief Committee to vie with the Government in feeding the poor in camps or keeping them alive in their villages. It was the object of the Government to save life. That of the Relief Fund was to mitigate suffering, to repair losses, and to promote self-dependence. When it is remembered that more than half a million was contributed by the Mansion House Fund, and that other large sums were contributed elsewhere, making in all 800,000*l.*, it must be admitted that the distribution of such sums demanded as much forethought, principle, and method as the expenditure on the part of the State. Money was accordingly given by local Committees for seed grain, for clothing, and for the hire of bullocks. In some instances children and orphans were fed, as were also persons who did not, for some good reasons, come within the sphere of official relief. Houses were rebuilt, day nurseries and feeding-kitchens for children were established, and cultivators were enabled to bear up morally as well as physically, and were rendered fit to plough and sow when the rain came at last. Noble contributions were made to this same fund by the Viceroy and the whole Anglo-Indian agency, as was the case in the Orissa and other famines, and the Committees were composed of all classes, missionaries of divers denominations, independent Englishmen, and collectors and judges.

Famines, like other serious events, have their humorous and absurd as well as their pathetic side. We were, however, hardly prepared to find from an anecdote of a little English boy recorded at p. 91 of the second volume, that Dickens's Mrs. Pardiggle and the Infant Bonds of Joy were not wholly imaginary creations of the novelist. The saying current in Northern Wales, "If it please God and Sir Watkin" found a counterpart in the case of a native schoolmaster and his wife in the district of Chingleput. They asked how they "could commit suicide without offending the Deity or the Rev. J. Davies Thomas"; this gentleman having obtained a paramount influence over the minds of the people. We have no wish to impugn the motives of the Sanitary Commissioner, who went about camps and relief works to test the physical condition of the ryots; but he seems once or twice to have doubted the evidence of his own senses, and even where natives continued to put on some flesh, he discovered reasons for refusing to admit this as an evidence of sufficient nutriment. Molière, we may remember, made one of his typical doctors tell a patient, "cette trop grande santé est nuisible. Voilà un œil que je me ferais crever si j'étais vous." It was often a struggle to preserve a compassionate feeling in the teeth of impudent frauds, or dogged refusal to comply with the most sensible and reasonable conditions. Native Committees thought this a good opportunity to do a little usury with funds entrusted to them. Owners refused to lend bullocks on hire to starving ryots who had lost their own. A nursery was emptied because a rumour had got abroad that the children were to be entrapped into Christianity; and ten thousand people deserted on one day for fear they should be carried off to forced labour in the hills. One native official persisted in returning all deaths as from cholera, or dysentery, or some usual disease, and ignoring the famine altogether. Another refused to feel the arm of a lad to ascertain his physical condition, on the ground that he could not touch a Pariah. A cow sold for a cake of coarse grain. A woman who died in the last stage of emaciation was found to have sixty rupees in cash tied up in her bundle. And, worse still, a man convicted of dashing out the brains of his children because he could not feed them, had enough money to keep his family for nearly a year.

The selection of these instances, calling up smiles or indignation by turns, must not lead us away from more affecting disclosures made by Mr. Digby. His pages attest in a hundred instances the generally patient attitude of the people, their trust and dependence on the beneficent English magistrates, their uncomplaining submissiveness to the Divine will. Nor have we any wish to pass lightly over the frightful incidents of the visitation which, to do Mr. Digby and his informants justice, are simply and truthfully described, without any desire to gratify a morbid excitement or a craving for sensational food. We remember an old Bengali crone who had far outlived all her contemporaries and who died some twenty years ago, fixing the date of her birth by saying to us that she was nine years old when one man ate another, *i.e.* in one of the famines of the last century. We fear that in several Madras villages dates will be fixed for a long time to come by these or similar horrors. It was impudently said after the Behar famine that the whole thing was got up between Sir Richard Temple and the Government of Bengal. No one will say this of Madras. Whatever difficulty there may be in ascertaining the exact number of deaths in Southern India—and the estimates vary from half a million to three millions—there can be no doubt that, in spite of active efforts and unstinted benevolence, the native population have passed through one of the severest ordeals on record. Apart from direct relief, various suggestions were tried and adopted, but they were mere palliatives. It occurred to a distinguished colonist to suggest emigration on a large scale. The Chief Commissioner of British Burma accordingly reported that he had plenty of waste land. The climate was not unfamiliar; rice could be cultivated; emigrants could be received and cared for in large depôts on arrival; houses could be built, bullocks and employment be supplied. It was thought that twenty thousand labouring men could be drafted off in this way; but, whether from the ignorance or from the extremely conservative habits of the Hindu, nothing was done. And, after all, what are a few thousand more or less where the reckoning is of millions? It is remarkable, however, that from the southern districts of Madras a natural stream of emigration yearly sets towards Ceylon. Where men were dying it was difficult to keep cattle alive, and a part of the second volume is occupied with the details of an experiment by which bullocks were fed with the leaves of the prickly pear. The prickles must be removed, and the cattle educated to eat this aliment, just as in Iceland ponies and cows are taught in winter to live on fish; but, owing to the cost and trouble of preparation, we do not gather that the cactus obtained more than a moderate success.

We have no space for the tremendous controversy which raged between Sir R. Temple, the *legatus à latere* of the Viceroy, and Dr. Cornish, the Sanitary Commissioner of Madras. The main point at issue was whether, in a time of famine, people could live properly on one pound of grain a day, and a small money payment to procure condiments. Sir Richard thought it could be done. Dr. Cornish thought it could not; and Mr. Digby, though evidently not favourable to the former, fails to sum up the evidence and decide the point. The benevolent reader may perhaps think that one pound and a half of grain would have been more advisable; but it is undeniable that the lower rate sufficed to keep people alive in Bombay, and we cannot blame an administrator of the humane character and extensive experience possessed by the present Governor of Bombay because he used all his endeavours to prevent needless extravagance when the Government was losing the mainspring of its revenues on one hand, and was disbursing millions on the other. Many other points are brought into relief by Mr. Digby's analysis. For instance, the difference between acute and chronic starvation is worth noting. Acute starvation is when men are cast adrift at sea, or lost in a jungle, or immured in a coal-pit for five or six days. Such are soon restored by judicious treatment and food. But chronic starvation—that is, insufficiency of nourishment for weeks or months—destroys the vital and assimilating power, and saps life slowly and surely. Even good food fails to restore men whose organs have degenerated from bad or insufficient aliments; and a lowered system, we know, invites cholera, dysentery, marasmus, and wide-wasting pestilence. It is impossible that Mr. Digby's compilation should not attract the notice of the Famine Commission, who for him will be as good as Plato, should other readers fail. We do not pretend to forecast all the recommendations of the Commissioners; but we are certain that their attention will be drawn to the improvement of agriculture and the conservancy of trees on permanently settled estates, while no Indian administration ought ever henceforth to be unprepared with well-planned schemes of public works for seasons of scarcity, and with a competent agency for organizing relief and regulating disbursements on a large scale, as Railway Companies keep up regularly a "breakdown" for collisions.

CHESTER'S LOVE'S MARTYR.*

It is not a little extraordinary that, in these days of reckless reprinting, a book of so great intrinsic interest as the *Love's Martyr* of Robert Chester should have waited until now, not only for an editor, but even for a commentator. A publication to which Shakspeare, Ben Jonson, and Chapman supplied original contributions has surely a very special claim upon critical attention, and it is another proof of the waste of ingenuity by English annotators of Shakspeare that, while so much matchless folly about the authorship and versification of the plays is annually foisted upon us, no one should have preceded Dr. Grosart in attempting to fathom the mystery connected with the Phœnix and the Turtle. We are not fully convinced that he has absolutely solved all the problems contained in a singularly knotty literary question; but at all events he has approached them from the

* *The Poems of Robert Chester (1601–1611), with Verse Contributions by Shakspeare and Others.* Edited, with Introduction and Notes, by the Rev. A. B. Grosart. Printed for Fifty Subscribers. 1878.

right point of view, and his conjectures, in some cases manifestly correct, are at least plausible in all.

The full title of the book here reprinted has the prolixity and verbose effusion of the Elizabethan age. It runs as follows:—

> Love's Martyr, or Rosalin's Complaint. Allegorically shadowing the truth of Love in the constant fate of the Phœnix and the Turtle. A poem enterlaced with much variety and rarity, now first translated out of the venerable Italian Torquato Cœliano, by Robert Chester. With the true legend of King Arthur, the last of the nine worthies, being the first essay of a new British poet, collected out of divers authentical records. To these are added some new compositions of several modern writers, whose names are subscribed to their several works upon the first subject—viz., the Phœnix and Turtle. Mutare dominum non potest liber notus. London. Imprinted for E. B. 1601.

The first thing we have to note is that the professed translation out of the Italian is a mere blind. No such poet as Torquato Cœliano exists. There was a certain Livio Coliano, whose *rime* were published at Bergamo in 1587, in the same volume with those of Torquato Tasso, and it seems likely that the English poet forged his original by combining those names. We have, therefore, to expect an original allegory of the martyrdom in love of two persons darkly spoken of as the Phœnix and the Turtle, followed by a version of the legend of King Arthur, and by certain "new," or hitherto unpublished, compositions on the same subject of the fate of Phœnix and Turtle from the pen of "several modern writers"—namely, Shakspeare, Marston, Chapman, Ben Jonson, and the poet calling himself "Ignoto." It is evident from the mere title-page that a dangerous, or at least a mysterious, theme, deeply interesting to highly distinguished persons, is here treated under a veil of allegory. The poem of Robert Chester, which occupies the first hundred and ninety-seven pages of the volume, is written partly in *rhyme royal* and partly in the six-line heroic stanza, and opens by describing how the gods met upon a solemn day in parliament, and how the various deities had each some sad tale to tell of outrage or misfortune. Last of all Nature comes, and reports that the fairest thing on her earth, the Phœnix, has suffered grievous sorrow. She then describes the person of the Phœnix at great length, with all the curious catalogue of charms in which the Elizabethan poets delighted to portray their loves. Some of this description is very pretty:—

> When the least whistling wind begins to sing,
> And gently blows her hair about her neck,
> Like to a chime of bells it soft doth ring
> And with the pretty noise the wind doth check,
> Able to lull asleep a pensive heart
> That of the round world's sorrows bears a part.

After a categorical eulogy, in which eyes, chin, neck, teeth, and so on each receive a special stanza, we learn that the real cause of grief is that this Phœnix, who is described as a woman and as a queen, has no descendant:—

> This Phœnix I do fear me will decay,
> And from her ashes never will arise
> Another bird her wings for to display,
> And her rich beauty for to equalise;
> The Arabian fires are too dull and base
> To make another spring within her place.

The gods are struck with consternation; but Jove, recovering from his astonishment, refuses to believe this story of Nature's until she shows him the portrait of the Phœnix. This done, the god acknowledges that Britain possesses no fire that can kindle a second Phœnix to be heir to this, but bids Nature go seek in the neighbouring Isle of Paphos, a delightful country where no poisonous reptiles lurk, for a turtle worthy of this royal bird. These are the stanzas, and they are well worthy of attention, in which this illustrious creature is described:—

> Hard by a running stream or crystal fountain,
> Wherein rich orient pearl is often found,
> Environed with a high and steepy mountain,
> A fertile soil and fruitful plot of ground,
> There shalt thou find true honour's lovely squire,
> That for this Phœnix keeps Promethean fire.
>
> His bower wherein he lodgeth all the night
> Is framed of cedars and high lofty pine.
> I made his house to chastise thence despite,
> And framed it like this heavenly roof of mine.
> His name is *Liberal Honor*, and his heart
> Aims at true faithful service and desart.
>
> Look on his face, and in his brows doth sit
> Blood and sweet mercy hand in hand united;
> Blood to his foes, a president most fit
> For such as have his gentle humour spited.
> His hair is curled by nature mild and meek,
> Hangs careless down to shroud a blushing cheek.
>
> Give him this ointment to anoint his head,
> This precious balm to lay unto his feet;
> These shall direct him to this Phœnix' bed,
> Where on a high hill he this bird shall meet,
> And of their ashes by my doom shall rise
> Another Phœnix her to equalise.

What result follows from this introduction of the Turtle to the Phœnix, or whether it actually comes off, is not told. There follows a prayer for the prosperity of the latter, and this gives place to a lengthy dialogue between the Phœnix, Nature, and the Turtle. No hint is given of martyrdom, or of the ominous sacrifice stated in the title; the poet carefully refrains from this, as too difficult or dangerous a theme for him to dwell upon.

Dr. Grosart has conjectured, and with every appearance of truth, that the subject so lovingly treated, so cautiously veiled in *Love's Martyr* was no less than the relation existing between Queen Elizabeth and Robert Devereux, second Earl of Essex. That the Queen should be described as a paragon of physical beauty so late as 1601 is by no means as paradoxical as it seems. A belief in the loveliness of Elizabeth, and in the freshness and dewiness of her virgin charms, was an axiom of courtly etiquette to the last. No matter how grim, how bald, how wrinkled the imperial vixen became, she was still the golden-haired rosy Gloriana of the dreams of the poets of her youth. One year later than the publication of *Love's Martyr*, in 1602, Sir Walter Raleigh, addressing a letter to the Queen, thought it not unadvisable to speak of her "celestial beauty." As to the term "Phœnix," that also was not unprecedented. As early as 1593 Churchyard, in his rare poem of "Churchyard's Challenge," which has been reprinted by Dr. Grosart, addresses the Queen under the title of "only Phœnix of the World." It is not quite so easy to identify Essex with the Turtle; but the long passage we have quoted above is full of striking points of resemblance. In the first place, "Paphos Isle" would plainly seem to be Ireland, whither Essex had gone, constant still, in spite of his reckless conduct, to the memory of his great mistress. This description is thoroughly in keeping with the contemporary view of him whose function it was "to keep the grim wolf from Eliza's gate"; and in Peele's *Eclogue Gratulatory*, addressed to Essex on his return from Portugal in 1589, Dr. Grosart has discovered some parallel passages which seem to give a strong colour of probability to his conjecture. If so, the *Love's Martyr* celebrates, in dark and muffled phrase, the unfortunate loves of Elizabeth and that great man whom she wished to marry, but dared not, and illustrates in a very curious way a singular point in English history.

The Robert Chester who wrote this poem is supposed to be the same person who was born in June 1566, was sheriff of the county of Herts in 1599, and received the honour of a Royal visit soon after James I. ascended the throne. On the 23rd of July, 1603, he was knighted at Whitehall, and he died on the 3rd of May, 1640. That he received such attentions and favours from the hand of the King is an additional proof which we offer to Dr. Grosart in support of his thesis, since it is well known that James I. made it part of his policy to reward such partisans of Essex as the author of *Love's Martyr* had, not without personal risk, proved himself to be. But of more interest to us by far than the original verses of Robert Chester are those lyrics which he induced his most eminent dramatic contemporaries to contribute to his venture. Of these the most prominent must always be the elegy and the *threnos* signed William Shake-speare. These melodious and beautiful verses, which foreshadow in their measure the inspired elegy of friendship in our own day, have hitherto been entirely unintelligible to students of Shakspeare:—

> Let the bird of loudest lay,
> On the sole Arabian tree,
> Herald sad and trumpet be
> To whose sound chaste wings obey.
>
> Let the Priest in surplice white,
> That defunctive music can,
> Be the death-divining Swan,
> Lest the requiem lack his right.

These lovely cadences have represented nothing to the mind that was intimate or characteristic; but, if we accept Dr. Grosart's theory, they take at once a clear though concealed and allegorical meaning. So it is with

> Death is now the Phœnix' nest,
> And the Turtle's loyal breast
> To eternity doth rest.
>
> Truth may seem but cannot be,
> Beauty brag but 'tis not she,
> Truth and beauty buried be.

In other words, this is the requiem, not precisely of the Phœnix, since the Queen was still alive, but of the love that united Phœnix and Turtle, Beauty and Truth, Elizabeth and Essex. That Shakspeare was a partisan of Essex is well known; the panegyric in the fifth act of *Henry V.* is but one eminent proof of this. But even a more curious testimony to it is the persistent silence of Shakspeare when, on the Queen's death, all the poets broke out into a chorus of elegiac eulogy. He was not disposed to laud the murderers of Essex, even when Henry Chettle, in his *England's Mourning Garment*, in 1603, called upon him almost by name to do so:—

> Nor doth the silver-tonguèd Melicert
> Drop from his honied Muse one sable tear,
> To mourn her death that gracèd his desert,
> And to his lays opened her royal ear.
> Shepherd, remember our Elizabeth,
> And sing her rape, done by that Tarquin death.

It is certainly more than a mere coincidence that Marston and Chapman, who were also among the "modern writers" who contributed to *Love's Martyr*, are associated with Shakspeare as equally blameworthy by Chettle. Chapman signs only one of these pieces, a strain of grave and gnomic verse not very easy of comprehension. Perhaps, however, he indited the invocation to Apollo and the Muses, and the address to Sir John Salisbury, which are both signed *Vatum Chorus*, and which we cannot agree with Dr. Grosart in attributing to Ben Jonson. John Marston, the dramatist and satirist, follows Shakspeare with four poems, all very wide of the mark, and full of perfunctory commendation of some vague feminine perfection. But his hyperbolical tropes afford us one atom of evidence, where he says that the beauty he praises has long grown into maturity. For the rest, we must suppose that Marston thought it well

to be extremely cautious in such perilous times. Ben Jonson closes the book with several contributions, couched in his manly style, but with a little more of his pedantry than we admire nowadays. Here, as everywhere else, Shakspeare transcends his illustrious compeers with the most perfect ease, and while they are enveloped in mists of ingenuity and an exploded philosophy, he rises at once into a clear air of harmony and tender music. His little Threnos, in five stanzas, is one of the lyrical gems of that age, and we can only congratulate ourselves that Mr. Robert Chester's ponderous poem was the cause of its composition. How Chester became intimate with so many of the greatest poets of his time, what his actual connexion with them was, why, after moving in so brilliant a circle, he slipped out of it, and died, as he had lived, obscure, so late as 1640, all this is unfortunately matter of vain conjecture. All we know is that in 1611 he brought out a second edition of *Love's Martyr* under a new title. Dr. Grosart has taken extraordinary pains in editing this important volume, and the fulness of the notes and of the critical introduction does credit to his scholarship. He may not have proved his point to the satisfaction of all students of Shakspeare, but at least he has propounded a very ingenious and a very poetical theory.

NEW SCHOOL BOOKS.*

THE making of many books is certainly no nearer its end now than it was in the days of Solomon; and, if there is one branch of the tree of knowledge more luxuriantly flourishing than its fellows, it surely is that one which bears "educational works." The mania for writing school-books which has attacked the whole literary world still rages undiminished, and affects authors great and small, professional and amateur alike. Every publishing firm of any repute is putting forth its "primers," "manuals," or "educational courses," warranted to excel and supersede all other class-books, no matter how long they may have enjoyed fame and favour. The only effect that this *embarras de choix* among school-books has yet had upon teachers is to raise a sect among them who denounce the use of school-books altogether, and preach the doctrine that lessons given *vivâ voce* are the only lessons that make any impression on the brains of their scholars. As for the scholars themselves, the effect produced upon their minds by familiarity with so many conflicting authorities was naïvely expressed by a shrewd child, who described two persons remarkable for diversity of opinion as "exactly like two histories, for the one contradicts whatever the other one says." Happily the two histories in the batch of school-books which we have now under review treat of subjects too widely sundered to give occasion for any such clashing of opinions. One merit, however, they have in common, and that no small one. They are written in the spirit that looks upon history as a record of such of the events of times gone by as stirred the spirits of men at the time they happened, or have produced results affecting the welfare of society in the present day. This mode of treatment is in direct opposition to those historians who maintain that history as an instrument of education is only useful when it acts on the emotions by enlisting the sympathies of the young in some one or other of the actors in its scenes. This, they maintain, can only be done by bringing children as nearly as possible into personal contact with the characters thus held up for their admiration or reprobation, or, in other words, by tickling their ears with gossiping details that are generally useless and very often untrue.

To be sure, the period of English history which Mr. Browning has taken in hand does not afford scope for many romantic stories, for it is our own matter-of-fact and prosaic nineteenth century. Mr. Browning rightly estimates it as a period of great intellectual progress, displayed chiefly in vigorous Parliamentary reform, the extension of religious toleration, and the diffusion of education. But we think he is going rather too far when he compares the political changes wrought in the last half-century to the effects produced in France when the First Revolution overturned the throne and dashed feudalism to the ground. Far from being revolutionary, most of the reforms of the last fifty years have been in the truest sense of the word conservative—that is, true to the traditions and the spirit of our Constitution. That spirit has always shown itself ready to change the machinery of government to suit the temper of the times, and to discard any part of that machinery as soon as it is proved to be worn out and cumbersome. Mr. Browning's little book is the last of a series edited by Mr. Creighton, under the title of *Epochs of Modern History*. This last epoch, its biographer tells us, "opens dark and gloomily"; however, it improves wonderfully as it goes on. He is very hopeful about its close, which finds England "ready with renewed strength to run a fresh career of prosperity and honour." The last chapter is especially comforting just at present, when there is so much croaking about the dangers which threaten our manufactures, our commerce, and even our territory, and when a voice here and there may even be heard advocating a relapse to the suicidal selfishness of a policy of Protection. In that chapter Mr. Browning compares England as it was and as it is, and proves by arguments, supported by statistics, that if increase of population, increase of wealth, increase of territory, and increase of commerce going hand in hand with decrease of pauperism and of crime, may be accepted as signs of the welfare and prosperity of any nation, then the English of the present day are tenfold more wealthy and more prosperous than were the English under the Regency. The chief steps or stages that mark the progress which has wrought such wondrous changes are, Mr. Browning considers, five—to wit, the Emancipation of the Catholics; the passing of the first Reform Bill; the Repeal of the Corn Laws; the International Exhibitions; the passing of the last Reform Bill. Now, to class the opening of an International Exhibition, even though it were the first of its kind, with the repeal of an oppressive law and the extension of the franchise, is too much like accepting the first Bonaparte's valuation of our countrymen and writing ourselves down a nation of shopkeepers; and to say that "all thoughts were concentrated on the Great Exhibition" is, we hope, an exaggerated view of the sensation which it produced. Nor can we pass without protest Mr. Browning's estimate of the originator of the Exhibition scheme; for, though no one can fail to admire the discretion with which Prince Albert filled a difficult position, that position was not one of such vast importance as to justify the assertion that "the prince's virtues formed the real foundation of the prosperity of the reign." For the rest, Mr. Browning gives a clear and concise account of the state of parties at the time when measures of Reform were first mooted, of the various stages of the struggle which resulted in the triumph of the Whigs, of the passing of the Reform Bill, and of the agitation throughout the country which accompanied the discussion of Parliamentary Reform and the repeal of the Corn Laws. And, although political changes, as being of the greatest importance, naturally claim the largest share of his space and of his attention, Mr. Browning has not failed to bring under notice every event of any moment either at home or abroad which has occurred within the scope of his period. But, among the causes which have brought about the immense social progress of the last half-century, he seems to have overlooked the important changes which the introduction of steam traffic has wrought, not only by the extension of commerce, but also by the effect which increased facilities for travelling have had in spreading education and religious toleration. Although Mr. Browning looks at history from a Liberal point of view, his book is moderate and impartial. It is an accurate and sensible compendium of a puzzling period of English history, and may be read with profit both by old and young. The simplicity of the plan on which it is written, and the absence of all superfluous details, make this little history of modern England as suitable for refreshing the memory of those who have lived through the times which it describes as for impressing the memory of the schoolboy, to whom all times alike are history.

The other history on our list is an elementary History of France. It is divided into two parts, each of which contains the whole history of the Gauls and Franks, from the burning of Rome by Brennus to the death of M. Thiers. The first part is a mere skeleton; the second puts a little more flesh on the bones. Now the value or worthlessness of such a little book must of course depend on whether its writer has or has not the knowledge and skill needed to pick out the real bones of history from the mass of less important matter underneath which they are hidden. Mr. Taylor has shown this knowledge in compiling this little manual; for the events for which he has found room in his very limited space are all really noteworthy, either from their immediate effect or from the results that followed them. Each division of the book is preceded by a list of names and dates to be committed to memory. We have no fault to find with such of these as commemorate deaths or marriages, battles lost or won, the passing of laws, the conclusion of treaties, or any such transactions of necessarily limited duration; but we think it unwise and misleading to class among such definite facts a condition of the State which came about gradually, such as "The Monarchy Absolute," "The Monarchy Victorious." Especially we must take exception to ticketing the date 1317 as "The Salic Law Adopted," as if in that year the Salic Law had been formally accepted as the Code Napoléon was in later times. For though the dispute about the succession brought the question of the law under discussion, the decision in favour of the male heir was no adoption of a new law, but only a declaration of the fact that the law of the Salian Franks still was, as it had always been, the law of the nation. In other respects the book so far as it goes is good. The explanations of the feudal system and of the States-General are clear and simple. Mr. Taylor has had the advantage of twenty years' experience in teaching. That experience has given him an insight into the tastes and powers of children, and has enabled him to write quite the best elementary History of France which has yet come under our notice.

The *First Principles of English Grammar*, by the same author, is also an admirable little book. Its object is to make the study of English grammar attractive rather than repulsive. This object it is well calculated to achieve from the clearness of the explanations, the simplicity of the style, and the absence of all technical terms. The opinion of the teaching world is at present pretty nearly equally divided on the question whether children are or are not capable of learning grammar. Probably the correct answer to this

question is, that some are and some are not. Mr. Taylor thinks that children not only can learn grammar, but that it is the science best adapted for attaining the real end of all education—the drawing out of their faculties—because it is the only science which treats of material with which all are familiar. Unfortunately the familiarity makes the difficulty, and many teachers find it much more easy to bring home to the understanding of their pupils the rules of grammar by teaching them hand in hand with a foreign language than by attempting to apply them to their own. For intelligent English children who can learn the grammar of their own language, Mr. Taylor's book ought to prove very attractive; for, instead of giving a collection of perplexing rules to be learned by heart, he explains the reason and origin of all the mysterious changes which affect the several parts of speech and their relation to one another, and illustrates his explanations from time to time by comparison with divers foreign languages. Mr. Taylor has taken his philology from good authorities. His explanation of the relationship of the different Aryan languages is very good and clear, and he turns the attention of the children to the origin of the words they use and to the poetry which these words contain, thus awakening in their minds an interest in the study of philology. He concludes by commending to them Mr. Earle's book on the English tongue, should they wish to continue this study further.

As for the *Advanced English Grammar*, it is very much less advanced than the unpretending little primer that we have just noticed. In compiling it the author seems to have followed the example of certain young musicians whose great desire is to make their compositions look as difficult as possible. The number of rules relating to each part of speech that have to be mastered by the learner before he can parse a simple exercise are very formidable, and the examples of "Tabular Analysis" and "Branch Analysis," given him as models for the dissection of sentences, must fill his heart with dismay and doubt. As far as the mere grammatical rules go, however, though there are more of them and they are more involved than is at all needful, the book is correct enough; but so much cannot be said for the "Sketch of the History of the English Language" which forms the concluding chapter. The author of this *Advanced English Grammar* has not himself advanced beyond that stage of philology which speaks of the Aryan languages as "Indo-European;" and the so-called "tree" which he has drawn out to exhibit the "descent and relations of the English language" is full of faults. The root of this tree is the "one speech" from which all languages are derived. As he immediately divides this "one speech" into the "Semitic," the "Japhetic," and "Hammic," it would have been more consistent to call it the Noahic. Of the languages which he derives from the Japhetic stem two have been hitherto unknown to philologers—the "Indic," father of Sanscrit, the "Classic," father of Greek and Latin. We had hitherto supposed that any language might be "classic," even our own mixed tongue. Among the brethren of the "Indic" and the "Classic" is the "Gothic," and it again is the father of the "Teutonic" and the "Scandinavian," from the first of these High and Low German, Dutch, and English are derived, from the second Icelandic, Swedish, and Danish. Of course this is all wrong, as these last are all cognate tongues; and to trace the one from the other in this way is like saying that the dialect of Norfolk is derived from the dialect of Somerset. Nor was there ever a spoken tongue that bore the name "Teutonic." Another error into which the author has fallen is that of dividing the growth of the language into five periods or stages, and assigning dates for the beginning and end of each. This is just about as sensible as fixing a day on which a young cat ceases to be a kitten and becomes a cat. Among these periods crops up again that ridiculous hybrid the semi-Saxon, which comes in like a comet with the Norman Conquest in 1066. It would be hard to show how the English of that year differed from the English that had preceded it by many years, or from that which was spoken for many years after it. Modern English begins in 1558 and is still going on. We only hope that much of the English which is spoken and written nowadays may not become the English of the future.

Of the *French Accidence and Minor Syntax* of Professor Léon Delbos there is little to be said. It is, as its name implies, a mere compendium of the rules of French grammar. It is intended to fill up the void which is left by the so-called Conversational Methods of teaching French now so much in favour. These are merely books of exercises which, though they give expertness in stringing sentences together and familiarity with the French idioms, leave the student without any systematic knowledge of the grammar. The book is written for the use of English learners, and in that language the rules are given. They are simply expressed and well arranged; the tables of the regular and irregular verbs are carefully drawn up, and those stumbling-blocks to the English student—the use of the subjunctive and past participle—are simplified as much as explanation can simplify them. It might be used with advantage as a companion to a larger grammar, and from its compact form is a convenient little book for impressing upon the memory rules the use of which has become familiar by practice in conversation and exercises.

Unlike the other books on our list, the *Class Book of Geography* is without prefatory notice or advertisement of any sort, so that we may take it for granted that its author merely intended it to be used like any other geography-book, and that it does not lay claim to any originality of aim or method. The only novel feature that we notice in its arrangement is that the chief *routes* of railroad in each country are carefully indicated, and that the towns are arranged in connexion with the lines of rail, instead of being merely catalogued according to their populations, as in most books of the kind. This is certainly a step in the right direction, for it is surely much more useful to know what railway you must travel by to arrive at any given town than to know on what river it stands or what is its size in proportion to the other towns in the same country. The aim of every teacher of geography ought to be to teach his pupils all that it is most useful for them to know concerning the surface of the globe in its actual conditions and divisions. Therefore it seems unwise to enumerate the provinces of France and to leave out of sight the departments, as Mr. Clarke has done. The departments are, to all intents and purposes, the only existing divisions of France, and no one can pretend to a knowledge of the country who is ignorant of them. Nor are they difficult to remember if the connexion between their names and the physical features of the land be borne in mind. It is a pity that it is not yet acknowledged that class-books of geography ought to confine themselves to describing the surface of the earth and its productions, and should not crowd and confuse their pages with scraps of history and philology, especially as the information which they contain is generally either antiquated or inaccurate. Mr. Clarke's book sins in this respect. It is certainly a little astonishing in a book published this year to find the Tell saga treated as authentic history, and to be told that "William Tell shot the apple from his son's head at Altorf in Uri." Mr. Clarke is, as we expected to find him, somewhat confused as to the titles and rights of the Emperors, but we did not expect to find him writing such nonsense as that:—

> Belgium formed the northern part of the ancient Kingdom of Burgundy. After the break-up of that kingdom, Duke Philip retained Belgium and married the heiress of Spain.

We suppose that by "Duke Philip" is meant the son of Maxmilian and husband of Juana, and that by Belgium he means the Netherlands; but surely the Kingdom of Burgundy had been broken up long before Philip's time; even the Duchy had ceased to be a separate State on the death of Charles the Bold. Turning to philology, we beg leave to tell Mr. Clarke for the benefit of his next edition that Turkish cannot be, as he asserts, a "largely corrupted dialect of Arabic," since it is a Turanian, and not a Semitic, language. Further, that when he wrote

> The inhabitants of South Tyrol and South Illyria speak *Romance*; a language descended from the Latin and closely allied to it. It is from their likeness to this language that the other languages descended from the Latin (as French and Spanish) are classed as Romance languages—

he fell into a very absurd error. All these languages are alike called Romance, because they are the living representatives of the Lingua Romana, or spoken language of Rome. From the writings of the poets and troubadours of Southern Gaul the word "Romance" passed into English and had taken root there while Tyrol and Illyria were still almost unknown countries, at least to Englishmen. In conclusion, we must protest against the statement that the Church of England is "Protestant-Lutheran"; and we should be glad to know why Mr. Clarke has distinguished the Scottish nation as "Protestant-Christian," while their fellow-protesters on the Continent are described as simply "Protestant."

THE GARDEN AT MONKHOLME.*

CRITICS who measure their words, and do not care to seem carried away without good cause, use the word "power" with a sense of venture and responsibility; nor would it occur to the reader, from the quiet tenor of the early part of the story, that it could be applied to *The Garden at Monkholme*; but with the third volume there comes a situation which needs power, and the author shows herself equal to it. In reading the opening chapters, where children are described as keenly alive to the doctrine of future rewards and punishments, we had a momentary misgiving that we were committed to a dogmatic novel; but the fear passed off as the attention and interest became engaged upon moralities more within the sphere of fiction. The author shows herself a student and close observer of human nature, as seen in temper, manners, and conduct. These supply her motives, and to show these she has devised and regulated her plot. It is not story first and characters to work it out, but a scheme of circumstances and events somewhat elaborately contrived to illustrate certain qualities and errors which have keenly occupied her sympathy and observation. The usual attributes of hero and heroine are not had recourse to. No extraordinary qualities separate them from commonplace humanity. Nobody is superlatively clever or beautiful. They are people of every day, except as manners, and especially as temper, distinguish them.

The heroine may be supposed to represent the author's ideal of womanly manner and character; she has sweetness, tenderness, and grace, all guarded by courage, firmness, and self-respect when rare occasions demand them. It is something in these days to have a woman made interesting through simply feminine qualities; because she is gentle, amiable, conscientious, innocently solicitous to please, and free from self-consciousness in doing so; with no gifts or charms that demand a distinct sphere for themselves, whose charm indeed is harmony of being; who is occupied with others, and with making

* *The Garden at Monkholme.* By Annie Armitt. Samuel Tinsley & Co. 1878.

their life as far as she can cheerful and happy: who receives the good things about her in simple thankfulness, not intent on divesting herself of them for the sake of others, but endeavouring to make everybody who comes within her influence the better for them. Violet is perfectly content with her position as woman, and has no aspirations beyond, either for herself or for woman in the abstract, using the distinctive weapons of her sex with a full reliance on their efficiency. As a child among boys she is fearless, relying on the sanctity of the argument, "I'm a girl, you daren't touch me"; and the same confidence gives authority and dignity to her manner in after years. But it also belongs to womanhood to test this privilege to the utmost, to be tempted by difficulties in the longing to surmount them. The rudeness of the boy was not quelled by her defiance, yet when he comes within the range of her influence in youthful manhood she is attracted by the same resistance; the fact that he is the only person she has found it hard to please and satisfy is an attraction as presenting an obstacle to surmount. The relations of these two—of Violet, the sweet woman, and the harsh-tempered but high-minded Redfern—constitute the interest and give occasion to the most stirring scenes of the story.

In order to make temper the motive power of the story the persons in it are saved from the commonplace class of temptations. The leading characters are represented as having certain respectable qualities as a common heritage. They bear the same name; Violet, her grandfather, and her three second cousins, are all Hilboroughs. All the Hilboroughs, we are told, are intensely just, and so can act towards one another in difficult circumstances in a way that persons not so distinguished would find neither possible nor wise. This cousinship has the additional advantage of bringing the young people into easy terms convenient for the plot, and rendering the frank tone of all parties natural. They are alike in certain main points, and understand one another; but acting on one another through their tempers and temperaments they arrive at extreme divergence. Redfern Hilborough is a study in a very true and careful sense; every reader's experience must furnish an example parallel at least in some leading feature. He is a favourite with the author. She may be supposed to have seen the consequences of temper on some fine natures. She understands the impulses and temptations which make some good people scarcely endurable. Redfern's home circumstances are not such as to correct a bad temper neglected in childhood. High-principled, and in a sense self-denying, he learns how to master his temper under trying or irritating circumstances; but it needs such circumstances to call forth his powers of self-control. His temper unfits him for ease and prosperity. Violet's sweetness provokes it. Though he is drawn towards her, the serenity and harmony of her being form a continual incentive to outrage; her general benevolence is matter for reproach; he tells her that he is not like her, a person easily pleased; her readiness to take blame on herself is a personal wrong; her accomplishments, he pronounces, are "the right sort of thing for people who like to feel pleasant sensations." While she endures his attacks, and seeks for something in herself to justify them, he pursues the same conduct; it is only when she turns again that he is recalled to his senses; for the selfishness and want of generosity that belongs to all ill temper characterize his, and "as usual he began to behave better as soon as he was not treated so well." Violet, while attracted by this character so opposite to her own, is not without discernment. In the following scene the cousins are together. Redfern had been showing what he called his bearishness in the morning. It is now evening. There is something in the refinement and comfort of the drawing-room life at Monkholme, where Violet is the presiding genius, that is particularly trying to him.

Redfern's bad temper had by no means exhausted itself, however. He was moody all the evening, and sat with a book in his hand while the others talked. "Violet," he said suddenly, after he had been indulging in a long and somewhat bitter meditation, "I shan't stay till Monday, after all." "Oh! Redfern, why not?" "I have decided to go with Gerald on Saturday." "I thought you said you could manage to stay?" "So I fancied. It will be best to go, however." Violet was silent.

"Is it your business?" she asked, after a moment's pause. "Not exactly; the fact is, this sort of thing does not suit me. I will go back to my work. It is the only thing I am good for." "Wait till to-morrow; you will think differently then," suggested Alfred. "Why should you go?" asked Violet, earnestly; "don't you really like being here?" "How should I like showing myself such a cross uncivilized animal?" "Never mind; if we are satisfied, you may be." "Thank you; you are generous; but I decline to be satisfied."

There was a long pause. Gerald had gone out of the room; Alfred and Violet were playing chess together. They went on silently; but Violet played abstractedly, giving no thought to the game. "I believe, Redfern," she said after some time, speaking very gravely and gently, "you think too much about yourself." "Probably," answered Redfern, curtly. "I am obliged to you for reminding me of it." "I don't mean selfishly," said Letty, looking anxiously at him, trying to meet his eyes, that he might see all the sympathy in hers; "but you think about your faults; and it is a mistake to do that too much, though it may be only to blame yourself." "No doubt," Redfern answered coldly, not looking at her, "I only make them more evident." "You give them more importance than they really have, and make them come between you and your friends more than they need do. Don't you think so?" She got up and turned towards him. She wanted to reach his thoughts and make him feel her sympathy, but she did not know how. He persistently avoided meeting her eyes, and he answered:—"You may be quite right; there is a simple way of avoiding such misunderstandings in future." He rose and closed his book. Letty looked at him with a troubled face. Alfred put his hand on his arm, and spoke impatiently. "Don't be absurd, Ref; and don't imagine because you are a little cross yourself that your friends want to quarrel with you." "I don't imagine so," answered Redfern less coldly than he had spoken to Violet; "I know they don't. Violet would be kind to a dog or a cat, much more to me. The fact is I don't belong to you all; we are not of the same sort, and can't agree. I have no business among you, and I'll go."

It is of course true that bad temper implies first and foremost thinking too much of self; but that is not always the impression it produces on the sufferer from it. And, disagreeable as Redfern makes himself, he is interesting to the reader. His way of making his offer, or rather declaration, is original. His beginning is so unpromising that Violet stops him. "If you are going to say something disagreeable, please don't; I would rather not quarrel before you go." "I am not," Redfern answered, with a harsh tone in his voice; "you think it impossible, I suppose, that I can say anything that is not unpleasant." "You very often do say unpleasant things," said Violet, in a low voice. "I know I do, and to you especially, and it is all because I like you better than anything else in the world."

In contrast to Redfern is his cousin Alfred, perfectly amiable, and yet, because described with understanding and sympathy for the placid temperament, by no means insipid. We are shown it under various forms of trial; thus under the infliction of two chattering young ladies, "Alfred gazed calmly and blankly before him into the distance, till the little gush of words should be over; he was always polite, and never in a hurry; he was also incapable of being bored; he seemed able to suspend his existence till it was again required, and to be troubled with no sensations in the interval." Again, "Alfred rarely lost his self-possession in any circumstances however difficult"; so he was able to talk to his host and hostess over dinner on an occasion calculated to test this power to the utmost. They go to a dance, where Redfern feels out of his element; but Alfred "went out to dances, as he did everything else, in a calm, business-like way, as if he knew exactly what came next, and what to do under all circumstances. It had always, even in his childhood, been easy for him to behave perfectly."

It is through the manners of her personages that the author shows what is in them, and therefore these are described with great nicety. At this same dance Redfern is puzzled by Violet; he felt he did not know her yet, and this because her manner always naturally adapted itself to the scene and occasion:—

Amid the crowd of women there, many were better dressed or prettier than herself, she took her own place quite naturally; she never seemed the one too many in any party, her place there always seemed to have been just made to suit her, she filled it so well. Under the simplicity and unreserve of her daily manners, he would never have guessed that so much self-possession existed; she seemed equally at home everywhere, and though in her own house she demanded no ceremony, and waited on every one as if she was the last to be considered, here she appeared as naturally to take all the attention and consideration that were given to her, as if the attitude of calmly ignoring everything but her own wishes, and letting herself be waited upon, was habitual to her. Either she thought so little or so much of herself—Redfern could not tell precisely which—perhaps it was something of both, that, so long as her own identity was unaltered, no change of position seemed to disturb her.

Manner such as this is not formed, though cultivation has some share in it; it is the natural expression of a sweet and strong nature, where there is no counteracting element, no inner jars to make the outer manifestation belie the inner promptings. The truthfulness of Violet's manner is elsewhere dwelt upon. It was always curious to Redfern to notice how truthfully "she conveyed her ideas of persons to themselves, through the most deceptive manners; she rarely, with all her habitual courtesy and kindness, made any one fancy she liked him when she did not."

We have not touched on the passion and tragic elements of the story. Violet has trials that perfect manners, however equal to every strain upon them, have nothing to do with. Such lovers as Redfern bring trouble with them. It is borne, according to sex and nature. As the writer observes, "A woman may sob away her grief in bitter tears; there is nothing a man can do to express his, except to abuse somebody." Violet overcomes her trial in a way scarcely to be recommended as a general resource, but we will not deprive the reader of the interest of scenes delineated with real power. One parting commendation we must give to the author's style, which is clear, simple, and correct. Words well chosen always give weight to thought, and are themselves a voucher for seriousness and truth of intention.

GERMAN LITERATURE.

PROFESSOR STERN'S Life of Milton is entitled to rank among the most successful biographies of a great Englishman written by a foreigner (1). The achievement is the more creditable from the great amount of historical knowledge, and the power of entering into the spirit of an era distant in time and dissimilar in feeling, which the satisfactory treatment of such a subject demands. Professor Stern has made himself master of the entire mass of contemporary literature bearing upon his theme, and shows an acquaintance with the slightest allusions and the most obscure pamphlets which would be astonishing if we did not consider how thoroughly the way has been prepared for him by his predecessor, Professor Masson. Professor Masson's work, though not likely to be superseded or rivalled here, is nevertheless too bulky for circulation abroad, and requires much more careful and prolonged study than can be reasonably expected from a reader whose literary interest in the subject is not reinforced by patriotic feeling. Professor Stern's work is quite the model of a Continental version of such a subject, discarding minutiæ, and insisting on nothing that is not of universal human interest. At the same time it is sufficiently apparent that

(1) *Milton und seine Zeit.* Von Alfred Stern. Th. 2, Bch. 3 and 4. Leipzig: Duncker & Humblot. London: Williams & Norgate.

he has taken nothing upon trust, and that all his statements have been verified by his own independent research. The first of these two final volumes deals with the Milton of the Commonwealth, the second with the Milton of the Restoration. The former, therefore, is chiefly occupied with the politics of the period, the latter with literary criticism. The author's candour and good taste are equally conspicuous in both. In the political department of his work he abstains from siding with either party. His narrative is unimpassioned, and his expressions of opinion are such as would generally be acquiesced in by historians of every school. The poetical criticism is equally judicious. Little of novelty, indeed, remains to be advanced respecting the general characteristics of Milton's style and thought; but Professor Stern has found interesting subjects for discussion in a parallel between him and Dante, who are justly placed on a level, in an application of *Samson Agonistes* to the poet's own circumstances, and in a comparison of *Paradise Regained* with Milton's long-lost theological treatise. Both these works receive fuller attention and more justice than has often been their lot; and, in general, Professor Stern's picture of Milton's latter days conveys more agreeable and acceptable impressions than we have been accustomed to receive. He shows himself everywhere deeply impressed with the moral purity and dignity of his hero, the most indispensable of all qualifications for a biographer of Milton.

The second volume of Professor Hüffer's (2) contribution to the diplomatic history of the French Revolution is occupied by the first part of his narrative of the Congress of Rastadt. Its materials are derived from an attentive study of documents in the principal European archives, and will be found highly interesting by those who care to investigate the devious byways of diplomacy. For general readers it is not adapted, nor does the subject admit of the display of any conspicuous literary power. That Professor Hüffer can write effectively on occasion, however, is shown by his review at the end of the volume of the motives and consequences of Bonaparte's Egyptian expedition, which gave a new turn to the negotiations, and revived the coalition against France.

Old Marshal Blücher (3) is a very good subject for a popular biography, such as that attempted by Dr. Wiggers. Few captains of equal mark have been so emphatically mere soldiers, so utterly devoid of culture, enlarged views, or any ideas beyond the meridian of the camp. These defects in no way disqualify the stout old warrior for a popular hero; and Dr. Wiggers has made the most of him in that capacity, toning down the asperities of his character, and rather insinuating than affirming that his rank is not after all so much lower than that of Napoleon, Wellington, and other contemporary masters of the art of war.

The principal object of Herr Carl Sachs's (4) expedition to Venezuela was the capture of electrical eels, which, relying on the testimony of Humboldt, he expected to accomplish by the instrumentality of mules and wild horses. Great was his consternation to find on arriving at the scene of action that the *modus operandi* so circumstantially and picturesquely described by Humboldt was unknown to the natives, and that, if ever resorted to, it could only have been for the purpose of disturbing the fish from their haunts at the bottom of the water. Herr Sachs accomplished his object by the more prosaic method of enclosing the eels between two capacious nets, the fisherman's hands being protected by gloves of india-rubber. He captured and dissected numerous fine specimens; but the five he brought alive to Europe only escaped the perils of the voyage to perish by the jolting of the train between Hamburg and Berlin, to the infinite regret of their captor, who seems not to have heard of the magnificent gymnoti now or lately flourishing at the Brighton Aquarium. His dissections, however, will furnish material for a work on a large scale, which we are bidden to expect in due season. His other observations on Venezuelan natural history, though not affecting scientific precision, are copious and interesting. They offer a vivid picture of the animal and vegetable life of that magnificent but neglected country, the tropical splendour of its forests, the impressive expanse of its boundless savannahs. Herr Sachs brings to notice many of the imperfectly known animal and vegetable productions of the country, one of the most remarkable of which is the *guachamacá*, a deadly poison which it is thought may be made useful in medicine. The people possess the customary virtues and failings of tropical Creoles; on the one hand, simple, hospitable, and naturally intelligent; on the other, idle, ignorant, and passionately addicted to gambling. At the time of Herr Sachs's visit the country was under the control of General Guzman Blanco, one of those beneficent despots who arise from time to time in Spanish America to govern with absolute power under Republican forms. Guzman did much for the country, and was compared by his countrymen to Moses, Napoleon, and Washington so long as his term of office lasted. Having further attempted to imitate Sulla by retiring to a private station, he soon found it necessary to fly for his life.

Dr. Chavanne's popular but circumstantial account of the Sahara (5) is completed. The last eight parts comprise the journey through the southern region of the desert from Tafilet to Timbuctoo, and the description of the Ammonian oasis, with other spots of similar fertility. Most of these contain abundant traces of Roman occupation and of an advanced condition of prosperity. Even now the majority are represented as exceedingly beautiful. An adjacent district is the subject of the third volume of Drs. Schneider and Haas's (6) account of Algeria, which treats principally of Oran and Tlemcen. Both these cities are fully described; the most important part of the book, however, is the appendix on the prospects of Algeria as a colony. The writers are of opinion that the Arab is unable to maintain his ground as an agriculturist, and that the only chance of averting the decay of the race is to remove it to the desert. The Kabyle, on the contrary, makes a good peasant, and is likely to form the staple of the future population, outliving the Arab, as he has outlived the Phœnician and the Roman.

Arthur von Studnitz's account of the present condition of the industrial classes in the United States (7) is a valuable contribution to the literature of the social question. The author visited America with a commission from the Prussian Minister of Commerce which procured him ready assistance from the various official bureaus and other agencies for the collection of statistics. The materials amassed by personal inquiry and by circular are arranged under a number of heads, conveying information respecting the centres of industry in the United States and the geographical distribution of special manufactures; the wages, food, and lodging of the workmen; the provisions adopted for their comfort and protection by their employers or by State legislation; their own trade and benefit societies; strikes, lock-outs, communistic and paper-money agitations, female labour, Chinese labour, the attitude of the press on moral questions, and other points connected with the general subject. The picture is on the whole not unfavourable, especially when it is considered that Herr von Studnitz's inquiries were made during a period of severe temporary depression. There is great poverty and suffering in some of the crowded cities on the Atlantic seaboard; but the Western workman is, on the whole, well paid and lodged, and exceedingly well fed. The American workman himself, when of English race, stands well in Herr von Studnitz's opinion; he is more steady, industrious, and trustworthy than the German; and even his disinclination to rough manual work has been serviceable by stimulating his ingenuity in the invention of machinery.

Dr. Kleinwächter's history of the English labour agitation in 1873 and 1874 (8) relates almost exclusively to the coal and iron trades, and is chiefly based upon reports and communications to the *Times*. It is therefore not very complete, but nevertheless offers a considerable amount of carefully and lucidly digested information. The writer's sympathies are apparently with the workmen, but he is little of a partisan.

The Russian and Polish languages are as yet little known to the rest of Europe. Herr Kohn and Dr. Mehlis (9) have consequently performed an acceptable service by abstracting, and reproducing in substance the numerous valuable contributions made by Slavonian scholars of late years to the pre-historic archæology of Eastern Europe. The sepulchral and other sites hitherto examined seem to belong principally to Poland, Lithuania, and the Ukraine. They are divided by the authors into five classes—caves, pile-buildings, megalithic structures, ordinary tombs, and the "Kurgans," or gigantic mounds, which are an especial feature of the country. The traces of cave-dwellings are scanty, and no human remains have been discovered there. There is, however, sufficient evidence that man in Poland was contemporary with the mammoth, as well as with the arctic fox and other animals no longer existing in the country. Vestiges of pile-dwellings are more frequent, the marshy nature of this country being favourable to them. Their inhabitants possessed domestic animals and could make pottery. No trace of either is found in the caves. A buried coin affords an unexpected proof that cromlechs were constructed as late as the time of Theodosius. Many of the earthen vessels, however, both of the smaller and the larger type, are of much earlier date, though few perhaps much older than the Christian era. The human remains discovered exhibit in general a physical type corresponding to that of the present inhabitants of the country. The explorations have afforded a very great number of interesting objects. A pair of iron earrings seems to bespeak a period when iron was still so scarce as to be deemed ornamental. At a later period gilded glass beads of great beauty frequently occur, and in Lithuania small glass lachrymatories to collect the tears of the mourners. On the whole, there seems sufficient evidence that the Sarmatians had attained to a certain civilization and a considerable degree of rude luxury before the introduction of Christianity. A second volume is to follow, and will be accompanied by a chart of the researches hitherto made.

T. Seemann's history of the fine arts (10) is a useful popular manual, accompanied by numerous and well-chosen illustrations.

In endeavouring to define "the fundamental law of intelligence

in the animal kingdom" Professor Vignoli (11) has got hold of a hazy subject, which he does not seem able to make clearer. It is evident that he is an evolutionist, that he holds the mind to have been developed *pari passu* with the physical organs, and that he thinks himself able, or almost able, to answer his own question, When and how did man become an intellectual being? We are sensible in reading, however, of a want alike of distinct conceptions and distinct expressions, and close the book with an uneasy feeling of having been put off with mere words.

The "historical basis" of Dr. Pfleiderer's (12) treatise on the philosophy of religion may probably be considered more valuable than the superstructure. It is only fair to say that it forms no inconsiderable portion of the edifice, the foundations having been laid broad and deep by a circumstantial, yet by no means tedious, analysis of the views entertained by the thinkers who since Kant's time have principally moulded German opinion on the subject. Even the speculative part of the volume is *quasi*-historical from the prominence given to the exposition of the views of other writers. Dr. Pfleiderer's own position is conservative as regards what he considers the essential spirit of religion; with the letter he allows himself considerable liberties. The chief defect of his work is the absence of any adequate recognition of physical science —in our day a most important element in the problem.

Dr. F. von Baerenbach (13) appears desirous of following a middle way in philosophical controversy; on the one hand, putting forth anthropology, or the science of human nature, as deduced from actual observation, as the sole foundation for philosophy; on the other hand, while accepting the theory of evolution, contending for teleology against scientific materialists.

Words have such influence on ideas, especially in subjects of speculative research, that the history of the formation of the terms used to express abstract conceptions or intellectual operations has a most important bearing on philosophical inquiry. It is agreeably as well as fully investigated by Professor Eucken (14), who, following an historical method, examines the state of philosophical terminology at the most important periods of intellectual history, noticing the introduction of new terms, the modifications in force and significance undergone by old ones, and the general action and reaction of speech and thought upon each other.

Herr Bücheler (15) seems to restrict the term philology to that textual criticism of the classics of which he is an admitted master. In his inaugural address on assuming the rectorate of the University of Bonn he reviews the present condition of this department of research, and, while claiming an authority approximating to certainty for its conclusions when attained by legitimate methods, severely condemns the ultra-scepticism which finds more interpolation than genuine matter in Horace and Juvenal. He indicates lexicography and syntactical grammar as the most defective departments of classical philology at present, and dwells on the great philological value of the inscriptions now so abundantly coming to light.

Some of the points of principal interest connected with the Italian Renaissance (16) are ably illustrated by Herr Janitschek, whose lectures, were they but more systematic, might rank as an excellent compendium of the elaborate works recently published on this subject. They are especially to be recommended for their numerous references to authorities. The author has paid particular attention to the position of women under the Renaissance, and has collected a number of authorities bearing on both sides of the question.

In his latest work, *Landolin von Reutershöfen*, Berthold Auerbach (17) has returned to the manner of his early *Dorfgeschichten*. It is an interesting and highly readable story, but too uncomfortable to be pleasing. Landolin, a man of violent and despotic temper, is impelled by passion into an act of homicide, committed certainly under very extenuating circumstances. He is acquitted by the jury, but condemned by public opinion; his neighbours shun him, his servants treat him with contumely, his daughter is estranged from him, his worthless son takes advantage of his condition, and his wife dies of grief. This event brings about a reconciliation with his daughter, and Landolin is conveniently drowned while on his way to reconcile the latter to her lover, whom she has renounced on his account.

The new volume of Freytag's great historical romance, "The Ancestors," (18) is one of the best of the series. It consists of two stories—the first illustrative of the condition of Germany during the Thirty Years' War; the second of the germ of Prussian military organization under the father of Frederick the Great. Both accordingly are military in subject—a peculiarity falling in well with the present aspect of the times in Germany, and with the author's attachment to the present Imperial system, which is indirectly represented as the ideal to which the previous course of German history has led up. The stories form the contrast and complement of each other—the first representing in lively colours the misery and weakness of the nation when destitute of military resources, and dependent for its very existence on the French and Swedes; the second showing forth the strength and security that spring from a rigid military organization, even when deformed by such eccentricities as Frederick William's passion for gigantic soldiers. The lesson is accentuated by a forcible contrast between the self-denying Prussian monarch and the dissolute Augustus of Saxony. The plots and personages of both tales are interesting, and they may be pronounced attractive, in spite of the author's stiffness of manner and almost pedantic allegiance to his patriotic design.

The most interesting article in the *Rundschau* (19), to English readers at least, is a review of Lord Beaconsfield's early career as a man of letters, by Professor Brandes. It displays a discriminating perception of the elements of Lord Beaconsfield's genius, and a less discriminating sympathy which carries the writer to the length of admiring *Contarini Fleming*. Another very interesting contribution details, for the first time with complete accuracy, the adventurer Bollmann's unsuccessful attempt to deliver Lafayette from his captivity at Olmütz. Lafayette's conduct on the occasion was less chivalrous than he subsequently strove to make it appear; but he showed himself grateful. The remaining contents include the last of Professor Max Müller's Hibbert Lectures; and a review of the Paris Exhibition, with especial reference to mechanical and electrical inventions.

The "German Theatrical Annual" (20) is an exceedingly complete and useful chronicle of the German stage for the past year, including a register of all the new pieces, acted or unacted, in many instances accompanied with critical appreciations; notices of all recent critical and other publications illustrative of the drama; a chronicle; a necrology; an account of commemorations and other remarkable performances during the year, and of the principal dramatic institutions of every kind, with much other matter. The total number of new pieces performed or published during the twelvemonth was not less than 656.

CURRENT POLITICS.

THE North Norfolk election has greatly disappointed the rising hopes of Liberals. Mr. FORSTER during his canvass had stated that the Liberals were in this comfortable position, that if they won they would win a great and important victory, while if they lost they would only be as they were. The event has shown that there was a third possibility which Mr. FORSTER had overlooked, and this was that the Conservatives should not only win, but should win by a majority so decisive as to show that their hold on the constituency had increased. The Liberals had not only retained their seat at Bristol, but they had a much larger majority than on previous occasions, and they made the most of this, and accepted it as a clear indication that the country was coming round to them. North Norfolk is the Conservative reply to Bristol; and whatever arguments may be founded on Bristol the one way may be founded on North Norfolk the other. Whether Bristol or North Norfolk furnishes the more trustworthy hints as to the result of a general election, no one can pretend to say. That Scotland and perhaps Wales and the large Liberal towns are more decidedly Liberal than they were is probably true. On the other hand, the control of the Conservatives over the counties is evidently not impaired. What makes the result of the next general election uncertain is that no one, not even local agents, can be sure which way the tide of opinion will run in the smaller English boroughs. In many of these boroughs the successful candidates have been returned by very narrow majorities, and a slight defection of these supporters might suffice to oust them at the next election. It may be fairly said that, if the permanent leanings of these minor boroughs are regarded apart from the questions of the hour, the Conservatives now hold a larger proportion of such seats than they are entitled to, and in the nature of things it is likely that some of these boroughs will, when an appeal is made to them, come back to their old fold. There are no symptoms of anything like a general revolt of the country against the Ministry. After all that it has done and left undone, the present Government occupies much the same position as when it entered on office. It rules the country after a mild Liberal fashion, and its great merit in the eyes of its supporters is that it keeps the Liberal leaders out of office. Its general character has not been changed, and its main merit is, in the eyes of Conservatives, and of that large neutral section which leans to Conservatism, as much a merit as it was five years ago. The Ministry is viewed by this neutral section very much as a shelter in the middle of the street is regarded by foot travellers. There is nothing very beautiful or attractive in the combination of a big gas-lamp and an array of iron posts round it, but it affords the momentary certainty of safety. The political [illegible] have got over the dangerous old Tory part of the [illegible], and they like to take breath before they try to [illegible] the dangerous new Liberal part. But even the most timid get tired at last of staying in a street shelter, and it may be that some of the more impetuous of the minor boroughs may be disposed to venture a little, and to see whether, either by shutting their eyes and rushing [illegible] daintily picking their way, they cannot get over the dreadful Liberal crossing without being knocked down.

That all the fierce disputes which have taken place over the foreign policy of the Government will not have any influence on the constituencies is improbable. But it is very easy to overrate this influence. The details of the controversy are soon forgotten, and they are sooner forgotten because a large number of people wish to forget them. They review in a very general manner what has happened, and they think that, if they do not much admire the Ministerial policy, they need not so far blame it as to withdraw the support they would otherwise give. They may agree more or less with Liberal criticisms. They may acknowledge that the Ministry so guided events, or that events so guided the Ministry, that Russia in the end gained enormously by the war, and that, with the Armenian fortresses made over to her, the D[illegible]ubian fortresses dismantled, the Persian trade secu[illegible] to Batoum, Bessarabia recovered, and her independ[illegible], and semi-independent Bulgarias, Russia has made as [illegible]ood a thing out of the war as she ever made out of [illegible] war. They may also be inclined to confess that the [illegible] of Cyprus exist as yet merely in the imagination, [illegible] that the chances of Turkey reforming itself are infin[illegible]imally small. But, on the other hand, they have a fe[illegible]g that England opposed Russia when no other P[illegible]r was willing to bell the cat; that she forced Rus[illegible]o yield points at Berlin which, whether important o[illegible] Russia was unwilling to yield; and that in Afghanis[illegible] she made Russia openly desert the ally who had been [illegible] on by Russia to destruction. We were saved at once [illegible] and from open humiliation, and for this there may [illegible]ly be a vague feeling of gratitude, even if Ministerial [illegible] are looked at in the blackest light, and Ministerial exag[illegible]rations of success are discounted to the utmost. It is this mode of looking at the whole matter which so far prevails that in many constituencies elections may be decided without any real reference to foreign politics, and not only the general leanings of the constituency, but peculiar local influences, may come into play. There were probably many more electors in North Norfolk who thought over the great fact that the new Lord HASTINGS is a Conservative than there were electors who troubled themselves with the problem whether the introduction of the gum-tree will or will not some day make Cyprus habitable. The very warmth, too, with which leading Liberals force foreign politics on the constituencies, although this warmth may proceed from sincere conviction and may not be without a legitimate basis, repels some voters, if it attracts others. The staunch Conservative will, of course, vote one way anyhow, as the staunch Liberal will vote the other; but the moderate or the wavering may be inclined to see in these acrimonious and personal discussions too evident a struggle for power; and it can hardly escape the notice of any one that Liberal leaders, by directing all eyes abroad, find a convenient mode of diverting attention from that question so easy to ask and so hard to answer—What are the Liberal measures on which Liberals generally are ready to combine and which they seek to recommend to the country?

When Parliament reopens, it will be informed what are the measures with which the Ministry will endeavour to occupy its attention as profitably as its dilatory habits of business will allow. There are three legal measures which can scarcely fail to form part of the programme, and which excite more than ordinary interest. There is the Criminal Code as revised by the three judges who will have done all that can be done to make a great conception perfect. If its details are to be debated it can never become law, and the Ministry must call on the House to take it nearly as it stands or to leave it

altogether. Not improbably it may be introduced first in the Lords, and the House of Commons will only have to pronounce on it after it has passed through the ordeal of the criticism of the Law Lords. Then there must almost inevitably be a real Bankruptcy Bill, not one of those dummy Bills which the CHANCELLOR, for the sake of his own private amusement, is always introducing; but a Bill which the Ministry takes under its charge and means to pass. Lastly the Government has let it be known that it will propose some measure for regulating joint-stock banks. It may prove to be little more than a measure for giving new facilities for escaping from the burden of unlimited liability, and for ensuring the accuracy and fulness of the accounts which the banks publish. But bankruptcy and banks are two subjects which now engross much attention, and any measures which deal with them are sure to be keenly and ardently debated. They cannot, in any sense, be called party measures; and Conservatives will feel at liberty to be as critical over their clauses as Liberals can be; but, at the same time, it will redound greatly to the credit of the Ministry if they can frame and pass well-conceived and effectual measures on subjects which vitally touch so many private interests. On two subjects alone the Government will have to encounter serious difficulties—the Budget and Ireland. It will be very fortunate if it can escape the disagreeable duty of imposing fresh taxation; and the rapid growth of the Floating Debt calls imperatively for some remedy. Ireland presents the Government with the embarrassing choice of doing nothing, and so bringing about the renewal of the alliance between the Irish party and the Liberals, or of proposing something which either will not conciliate the Irish priests or will alarm the sensitive Protestantism of England. It may be conjectured from its antecedent history that the result of the deliberations of the Ministry will be that in so critical a state of things it had better do something to please Ireland, but that it had better do as little as possible.

MR. CHAMBERLAIN ON CLUB GOVERNMENT.

MR. CHAMBERLAIN presided a few days ago at a meeting of the branches of the political Club which calls itself the National Liberal Association. It was not to be expected that he should answer the arguments which have been urged against the new organization for packing Parliamentary and municipal elections, and for excluding the greater part of the upper and middle classes from participation in public life. No unanimous assemblage wishes to be reminded that the soundness of its principles and the legitimacy of its objects are called in question. It was easier for Mr. CHAMBERLAIN to dispose of his opponents by dividing them into two classes whose opinions are of course equally unworthy of attention. It could not be expected that Conservatives would admire a system for depriving them of political power; and, if any Liberals disapprove of Mr. CHAMBERLAIN's purposes and methods, he is prepared to use an argument as simple as that of LORD PETER in the *Tale of a Tub*. "I say that it is a good "organization; I swear it is a good organization; "and if any Liberal doubts it, I tell him that his "Liberalism is only skin-deep, and that he has as little "regard for the principle of popular self-government as "Prince BISMARCK himself." If popular self-government has any meaning, it includes the right of taxpayers to be represented in the body which receives and spends their contributions; but in Birmingham, and probably in other towns which are controlled by clubs formed on the American model, no ratepayer has a chance of a seat in the Town Council for himself, or for the representative whom he would prefer, unless he disapproves of the Treaty of Berlin and the Afghan war. Having established in his own town the absolute dominion of a single faction, Mr. CHAMBERLAIN desires to acquire similar ascendency in the country by a further extension of the suffrage. He dwelt at Leeds on the notorious fact that, after all the changes of late years, the numerical majority is still not wholly supreme in England. Constituencies vary, he says, and the votes which are possessed by more than half the population are so distributed as to give the minority some share of the representation. Mr. CHAMBERLAIN, therefore, thinks "that they might have in con-"nexion with this federation something to justify the "right of public agitation to which they owed most of the "priceless liberties which they enjoyed."

The legal right of public agitation exists without dispute, nor is it likely to lapse into desuetude as long as ambitious and turbulent politicians can attract popular attention. The process of political disturbance now contemplated is indirect, and not a little complicated. The managers first assume that at Birmingham or elsewhere it is expedient to concentrate the power of a party already united by similarity of opinion. A Committee is therefore elected to choose candidates and to manage elections in the interest of the faction. Having discharged its primary functions, the Committee is, in concert with other bodies of the same kind, to promote agitation for any object which may seem desirable to the leaders. One object of attack is to be the prerogative of the Crown, which, according to Mr. CHAMBERLAIN and his friends, has been unduly strained by the responsible Minister and by his accomplices, who form the majority in both Houses of Parliament. The only charge at present brought against the House of Lords is that the necessity of obtaining its concurrence tends to modify the character of measures when they are introduced into the House of Commons. The great object of a Second Chamber seems therefore to be effectually attained in the English Constitution. The threatened agitation will apparently be directed in the first instance against the system of representation which was established in 1867. Alarmists have often foretold the tendency of each successive extension of the suffrage to promote further changes in the same direction. It is not until universal suffrage and equal electoral districts are instituted that Mr. CHAMBERLAIN and Mr. GLADSTONE will be satisfied. Experience will show whether the revival of agitation after a lapse of twelve years is premature. It is at least possible that the managers of the Liberal Association may alienate some of their supporters by disclosing their projects too early. Though the QUEEN, the Lords, and the Commons are not, as Mr. CHAMBERLAIN supposes, the three Estates of the Realm, it may not be prudent to attack them all at once.

Mr. CHAMBERLAIN may take a useful hint from some judicious omissions in the version of his speech in the *Daily News*. The only London morning paper which shares the opinions of the federated Liberal Association has thought it prudent to suppress all intimations of division in the ranks of the party. By far the most significant part of Mr. CHAMBERLAIN's speech as President was his intimation that Lord HARTINGTON must be prepared to make concessions to his more advanced followers. In the report which may be deemed official Lord HARTINGTON's name is suppressed, and some vague platitudes about concession in general are substituted for a definite warning. Mr. CHAMBERLAIN professed himself unable to distinguish between the Liberalism of Lord HARTINGTON and the Conservatism of Sir STAFFORD NORTHCOTE; and it is indeed probable that the two adverse leaders of the House of Commons would, if they were left to themselves, pursue nearly the same objects by nearly the same means. Nevertheless Lord HARTINGTON has not shown undue backwardness in recognizing the claims of party. The least prudent of his acts since he held his present position have been large concessions to Mr. CHAMBERLAIN's section of the Opposition. In the Session of 1877 Lord HARTINGTON induced the entire party, with two important exceptions, to pledge itself to the extension of household suffrage to counties. The formation of a Liberal Ministry may perhaps be seriously impeded by the wise and patriotic refusal of Mr. LOWE and Mr. GOSCHEN to concur in the proposed deterioration of the suffrage; nor could any measure tend so directly to dissatisfy the farmers, who understand that they would be practically disfranchised by the substitution of the household franchise for the present qualification. A more gratuitous mistake consisted in Lord HARTINGTON's invitation to the Scotch Liberals to begin an agitation for the disestablishment of their Church. The overture was at the same time virtually addressed to the English Nonconformists, although Lord HARTINGTON abstained from announcing a positive opinion. The Liberal party in Scotland is strong enough to bear some defections without losing the supremacy which it has enjoyed since the first Reform Bill; but those who are skilled in such matters assert that Lord HARTINGTON alienated a certain fraction of his supporters without conciliating a single new adherent. He now finds that Mr. CHAMBERLAIN demands a further concession or sacri-

fice." It happened that on the same day on which HARTINGTON threatened the Scotch Establishment, CHAMBERLAIN was engaged at Birmingham in denouncing the laws which facilitate the accumulation of large landed estates. It is not perhaps on this point that he will expect Lord HARTINGTON to join in his agitation.

In a second speech at Leeds Mr. CHAMBERLAIN thought it worth while once more to deliver the stock phrases about Turkey, Russia, and Afghanistan which have worn out the general patience. Paying a just compliment to Sir W. HARCOURT's eloquent speech at Oxford, Mr. CHAMBERLAIN said, with perfect truth, that Sir M. HICKS-BEACH had not answered it when he made a speech some days later. Sir M. HICKS-BEACH may not be a match for Sir W. HARCOURT as a debater, and yet he may be right as to the matter in dispute. Sir W. HARCOURT expounded with great effect opinions which derived their sole novelty from his mode of treatment. The answer, whether good or bad, has been repeatedly stated, in speech and writing; and Sir M. HICKS-BEACH would have done his colleagues and his party no service by repeating familiar arguments. Mr. CHAMBERLAIN was not afraid of exhausting the patience of a friendly audience by a long enumeration of charges which have become thoroughly commonplace. It is a waste of time to assert or to deny that, if Lord BEACONSFIELD had not been checked by opposition, England would now have been at war with Russia in defence of Turkey. Lord BEACONSFIELD himself expressed the opposite opinion, that firm resistance on the part of England would have prevented the occurrence of any war. Neither the Minister nor his implacable assailant knows what would have happened if circumstances and acts had been other than they were. Peace has, in fact, been preserved in Europe; and it is a matter of secondary interest whether the credit of the result belongs to the Government or to the Opposition. On the whole, it is perhaps as safe to refer effects to actual causes as to speculate on hypothetical tendencies. The Afghan war may probably cause political complications, and it will certainly cost considerable sums of money. On the other hand, peace would have involved acquiescence in the transfer of Afghanistan from English to Russian influence. It is probable that future wars and internal difficulties may be averted by the conviction which now prevails in India and throughout Asia, that the English Government is both able and willing to maintain its power by arms. Indian princes are fortunately not likely to read the arguments by which Mr. CHAMBERLAIN convicts Lord BEACONSFIELD and his colleagues of continuous folly and crime.

ROUMANIA AND THE JEWS.

AMONG the numerous liabilities which the English nation has assumed, either alone or in concert with other States, is the establishment of religious equality between Jews and Christians in Roumania. It happens that in England itself the Jews are still subject to one contingent disability. When a few years ago their claim to sit in Parliament was conceded by a compromise, both Houses severally reserved to themselves the right of admitting or rejecting Jewish members by resolution. The House of Commons exercised its discretion in their favour; and it was found that several constituencies were willing to return Jews, although Roman Catholics are still practically excluded from the representation of England and Scotland. It is not until a Jew shall have been raised to the peerage that the House of Lords will be called upon to decide whether he shall be allowed to take his seat. The present leader of the House would cordially support the Jewish claim; but his predecessor in the lead of the Conservative party was one of the most obstinate opponents of the admission of Jews to either House of Parliament. Lord BEACONSFIELD may be supposed to have approved the clause in the Treaty of Berlin which imposed on Roumania as a condition of recognized independence the grant of equal civil and political rights to religious dissidents, or, in other words, to the Jews. All Jewish disabilities have been abolished in France since the great Revolution, and the French Government consistently takes an active part in the extension of the same rights to the Roumanian Jews. The stipulations of the treaty would probably be disregarded by the Roumanian Government, if England and France had not retained an instrument of diplomatic pressure. Neither Power has yet appointed a representative at Bucharest, and it is understood that the measure is postponed until the Roumanians have admitted the Jews to equality. In the meantime a Government not yet formally recognized finds it impossible to borrow money, especially as the quarrel concerns the Jewish capitalists of Europe. The same powerful body has had much to do with the novel enthusiasm of statesmen for the establishment of Liberal principles in foreign States of secondary rank. Catholic Emancipation, while it was still in dispute, was not made a subject of diplomatic representations; nor at the present day would any foreign Government venture to urge on Russia the expediency of tolerating Polish Roman Catholics or native dissenters from the orthodox faith.

As the late war had been undertaken, among other pretexts, on professed grounds of religious sympathy, it was perhaps natural that the Plenipotentiaries of Berlin should listen to the grievances of the Roumanian Jews. If frequent and concurrent reports could be trusted, the persecution to which they were subject had extended far beyond refusal of political equality. It was said, and it is believed, that they have been the victims of lawless and unpunished violence; and on one occasion some of them were drowned in the Danube in an attempt to reach the tolerant dominions of Turkey. A more endurable hardship consisted in their exclusion from the right of possessing landed property, as well as from admission to Parliament. It may have been thought that a share in political power would furnish them with the most effectual security against oppression. It seems that the Roumanian newspapers of the party which calls itself Liberal now assert that, in the interest of the Jews themselves, it is not desirable that they should attain political freedom. The Secretary of the Anglo-Jewish Association complains that even Jews whose families have been settled in the country for centuries are described as foreigners. On this pretext the Senate and the Chamber of Deputies have passed a resolution that the whole question shall be submitted to the electors. The friends of the oppressed minority apprehend that the result of a popular vote would be adverse; and it is in any case the duty of the Legislature to decide for itself whether it will comply with the demands of the Great Powers. No objection could be made to a decision that aliens should only be admitted to equal rights with the natives after regular naturalization; but, if the electors or the Parliament begin by defining Jews, whether indigenous or immigrant, as foreigners, a religious disability will be imposed under colour of a national distinction. It may or may not have been the business of the European Governments to require from the Roumanians the establishment in their country of religious equality. As full consideration was given for the concession demanded, in the form of recognition of independence, it will be necessary to insist on the performance of the obligations created by the Congress.

Mr. JON GHIĆA, a Senator and a member of one of the first Roumanian families, has published an apology for the conduct of his countrymen which deserves notice on account both of its substance and of its tone. In the first place, he distinguishes between the old Jewish inhabitants of the Principality, who are of Spanish origin and language, and whose ancestors must have come from Turkey. From the earliest times, according to Mr. GHIĆA, these respectable Jews enjoyed perfect freedom; and he has now no objection to admit them to full political equality. If they bought no land, it was because they preferred investments which produced them eighteen or twenty per cent. It would seem that they practised the national occupation of money-lending without incurring the unpopularity which generally attends usury. The Spanish Jews had, above all other claims to consideration, the merit of being few in number. Fifty years ago there were only ten thousand of them in Moldavia and Wallachia, and there were no Jews of any other stock. The objects of dislike, and indeed of persecution, are Jews of an entirely different type, who have swarmed across the frontier from Austria and Russia. Though they are mostly Polish Jews, they oddly speak a German dialect; "they are full of prejudice and fanaticism, they gain their living by low "means or by extortion, live in the greatest filth, "and have nothing whatever in common with the "customs, feelings, or aspirations of the Roumanians." In another passage Mr. GHIĆA asserts that all the Jews enjoy excellent health, so that their filthy mode of living appears to be wholesome. The fanaticism of an unpopular minor-

ity concerns themselves more than their neighbours; but it must be provoking, after leaving a virtuous and happy Roumanian village, "to visit the same place after a "year's interval, to see the tremendous increase of the "Jewish element, and to watch its encroachment on the "native population; to see whole streets and shops that "were once peopled with Roumanians turned into Jewish "quarters, and counters stocked with adulterated goods "and false merchandize; to see how a Christian can "hardly pass in the street without being insulted by "Jewish children, and to see them muttering their prayers "in the open streets and impeding all circulation; lastly, "to see the desolation of a Moldavian town on a Saturday, "when nothing absolutely can be had for love or "money."

The persecution of adult Christians by Jewish children ought to be checked by the police; and it is not easy to see how the pious practice of muttering prayers can impede circulation. A Moldavian Saturday seems to excite among the indigenous population the melancholy feelings with which Frenchmen regard a London Sunday. None of Mr. Ghica's charges seem to bear on the emancipation of the Jews. If some of them sat in Parliament, or voted for members, their children could not be more ill-behaved; their prayers would still impede circulation; and, above all, it would be impossible to get anything on Saturday for love or money, unless, indeed, some enterprising Christian shopkeeper were to take the opportunity of bidding for Sabbatical custom. In a more serious spirit Mr. Ghica asks, with perfect fairness, how Englishmen would relish the society of three or four millions of foreigners who neither spoke English nor felt like Englishmen. The objection which would undoubtedly be felt to the presence of a large alien population would be greatly aggravated if they came with foreign passports and claimed foreign protection. If any of the Roumanian Jews affect to be Russian or Austrian subjects, entitled to the protection of foreign Governments, Mr. Ghica's case is unanswerable; but as the immigration began, according to his statement, in 1835, a large portion of the obnoxious community has, so far as they are concerned, probably been born in the country. Neither France nor England will demand Roumanian citizenship for Russian subjects. It would probably be advantageous to the Roumanian Government to give immigrants a motive for disclaiming foreign protection. Mr. Ghica proposes to admit to civil rights Jews born in Roumania who have served in the army, or have taken a University degree, who exercise a liberal profession, or who possess or work any factory; "but to oblige the "Roumanians to accept at once all the Jews in the country "as their equals would be an injustice unparalleled in "the annals of nations, and one fraught with much danger "to the future of this country." It may be readily believed that a measure unpalatable in itself becomes still more distasteful when it is imposed by foreign Governments; but, notwithstanding Mr. Ghica's temperate and plausible argument, the Roumanians would do well to submit to the decision of the Congress. Though the Jews are numerous, the Christians can outvote them by nine to one, and they need not elect Jewish members to their Legislature. It will be well to detach a wealthy and powerful body from the patronage of neighbouring Governments, and to give them an additional stake in the country. If the Jews are theoretically allowed to purchase land, they will probably, like their Spanish co-religionists, prefer investments which return twenty per cent.

M. GAMBETTA AND THE REPUBLICAN MAJORITY.

THE Ministerial crisis in France has been at once more and less serious than it promised to be last week. There was a deliberate assault upon the Government—an assault in which M. Gambetta took part, though only as a private soldier, and yet this assault came to nothing. Both these circumstances give food for wonder. Down to the appearance of the Ministerial programme it seemed probable that M. Gambetta had determined that M. Dufaure was to be left in peace. He was not in all respects the Minister whom the country wanted or whom it suited M. Gambetta to have in office; but the disadvantages of removing him were many, and on the whole they weighed down the advantages. The first surprise was the discovery that M. Gambetta had suddenly changed his mind on this point. The moment that the programme had been read to the Chambers the *République Française* opened fire upon it. It was utterly inadequate as a statement of Ministerial intentions, and it was impossible that a Ministry which had put out such an inadequate statement should be allowed to remain in office. Yet that M. Gambetta should seriously desire to upset the Ministry seemed altogether unintelligible. No man had shown a more complete appreciation of the importance of not frightening the country by any sudden identification of Republican institutions with the ideas of advanced Liberalism. The form of government is one thing, and the laws passed under a particular form of government are another. Before M. Gambetta, Republican politicians had always confounded the two. They valued the Republic not for itself, but for what it proposed to do. It was this feeling that paved the way for the establishment of the Second Empire. One reason why the *Coup d'état* excited so little emotion in France was the conviction of a large number of the class from which the Republican party was then mostly recruited that the Prince-President would give them more of the things they wanted than the National Assembly. M. Gambetta, on the other hand, has always declared that the first and essential thing was to get the Republic firmly set on its legs. After that, it would of course be desirable to see that it walked in the right direction, but the first thing was to put it in a position to walk. The benefit of this policy has been seen in a wonderful change of feeling towards the Republic in the rural districts. The old distinction between the townspeople and the peasantry no longer exists. The Republic has been established by the very class which used to be regarded as most certainly and obstinately opposed to it. Nor has this been one of those sudden changes which are likely to lose their effect as soon as the particular circumstances which called them forth have ceased to operate. It has been slow and promises to be lasting, because it has not been called forth by any particular set of circumstances. The peasantry have accepted the Republic not because it was identified as in former times with this or that sensational and exceptional piece of legislation, but because for the first time it was not so identified. They liked it because it was different from the Republics they had known or heard of. Now if M. Dufaure had been overthrown as soon as the change in the composition of the Senate left the Chamber of Deputies free to go its own way, sober Republicans throughout the country might have begun to doubt whether, after all, they were as secure against revolutionary changes as they had supposed themselves to be. They had been so well content with M. Dufaure, or rather they had been told so persistently that the question at issue in every election was not whether the Republic should be administered by this or that Minister, but whether the Republic should continue to exist or be replaced by some other form of government, that they had never seriously considered what effect the return of a Republican majority in both Chambers would have upon the composition of the Cabinet. Yet, after all, as soon as this majority found itself firm in its seat it proceeded to turn out the men under whom its power had been gained and consolidated. Too little is known about the modes of thought of the French country people to say how far this use of power on the part of the Republicans would have alienated or alarmed them, but what little is known certainly suggests that it might have done both. M. Gambetta knew all this, and he knew also that, considering M. Dufaure's age and the near approach of the period at which the Constitution may be revised, the life of the present Cabinet was certain not to be a long one, even if it were left completely unmolested. Apparently, however, this knowledge had no effect on him. Unless he is to be entirely separated from his newspaper —which seems improbable, since in that case why have a newspaper?—he did all he could to bring about M. Dufaure's overthrow. No doubt explanations can be suggested which go some way to account for a fact in itself so strange. M. Gambetta was afraid of the influence of the men who still hold the great military commands; he was afraid of the concealed hostility of the local magistrates; he was irritated at the choice of General Gresley to be Minister of War; he was afraid of losing his hold over his party if he disregarded these things. It cannot be said, however, that any one of these considerations, or all of them together, constituted a sufficient reason for upsetting the Ministry without taking into

account the effect which such a step was likely to produce in the country; and it consequently remains true that M. GAMBETTA has shown less statesmanship at this critical moment than might fairly have been expected of him.

The second surprise comes as a corrective to the first. Any deficiency in statesmanship on the part of M. GAMBETTA is undoubtedly a serious calamity to France. To all appearance the future of the Republic—of the only stable government that there is any present possibility of establishing in France—rests in a very great degree upon his self-command and upon his power to control the more excited members of his party. No other politician on the Republican side combines the necessary qualifications for exercising this moderating influence. It is not enough for a man to be himself reasonable and cautious; it is necessary that he should have the faculty of recommending reason and caution to those who by nature and previous training have very little of either. Until last Monday there was a further reason why it appeared all important that M. GAMBETTA should not depart from the prudent course he has hitherto marked out for himself. His power over the Republican majority seemed so absolute that there was no chance of its refusing to follow him wherever he might choose to lead it. But on Monday there came the second surprise. M. GAMBETTA's power over the Republican majority proved to be less absolute than had been thought. When it came to the point that majority was willing to follow him a long way, but it was not willing to follow him as far as he wished. It seems plain that, had M. GAMBETTA been prepared to take office, the DUFAURE Ministry would have been defeated. So far the majority is homogeneous. It recognizes M. GAMBETTA as the leader, and it feels that it cannot refuse to place its leader in office provided that it has the power of placing him there, and that he wishes to be placed there. But M. GAMBETTA wanted more than this. He desired M. DUFAURE to be succeeded, not by himself, but by a Minister who would occupy a position of nominal independence and real subjection. His dislike to taking office under Marshal MACMAHON is insuperable, and the only result of M. DUFAURE's overthrow would have been the appointment of some more advanced Liberal to the Presidency of the Council, with M. GAMBETTA still remaining in the background as adviser-general to the Ministry, with the right of determining without appeal when it should be sent about its business. This state of things would shortly have become intolerable, but the marvel is that, though M. GAMBETTA did not recognize this fact, it was recognized and acted upon by a majority of his party. This is a gain to the prospects of the Republic, which goes a long way towards compensating the injury it has sustained by the discovery that M. GAMBETTA is less removed than he appeared to be from the temptation to commit great imprudences. After all, no better evidence can be given of the success of a system of teaching than the fact that it enables the scholar to detect an error on the part of the teacher. This credit M. GAMBETTA may fairly claim for the education which he has given the Republican majority. He has constantly preached to them the need of keeping their tempers under control; of being content with Republican institutions, even though they might not at first bear all the fruit that was expected of them; in short, of practising patience when things were going well with them, just as resolutely as when they were going ill. Suddenly M. GAMBETTA forgets for the time his own counsels, and his great influence over his followers makes it more than probable that they will forget them too. But when the decisive moment comes, it turns out that the principles of opportunism have taken such root in their minds that they cannot be pulled up again, even by the teacher who has planted them. Though M. GAMBETTA has ceased to be opportunist, a majority of the Republican party remains opportunist. It is an unmistakable mark of progress in the Republican party that it has been found able to choose the right path alone.

MR. FORSTER ON RECIPROCITY.

MR. FORSTER was better employed at Bradford than in Norfolk, though there is no reason why he should not make a party speech for the purposes of an election. To be commonplace and one-sided on proper occasions is not discreditable; but the vulgar work of faction ought, if possible, to be done by obscure partisans. Mr. FORSTER is too good for an employment which he nevertheless pursues with considerable zest. He undertook to persuade any electors of North Norfolk who had not already made up their minds that the Government was greatly to blame for attending rather to foreign than to domestic affairs; but, as it was possible that the audience might share the error of the Ministers, Mr. FORSTER also devoted two-thirds of his speech to Turkey and Afghanistan. The only result of his interference is to give additional significance to the triumph which has been achieved by the Conservative party. A day or two afterwards Mr. FORSTER probably felt relief in turning from party declamation to the more intellectual and useful process of instructive reasoning. It is satisfactory to find that a large assembly of his principal constituents cordially welcomed a representative who has, by his defiance of dictation, lately established an additional claim to their confidence. The local faction which had hoped to compel his submission now finds it prudent to attempt a compromise by some such device as an ostensible negotiation between a committee of the Liberal Club and an equal number of Mr. FORSTER's friends. Their overtures will probably be favourably received; but the blow which has been inflicted on the managers of the new American system will be severely felt, not at Bradford alone. Mr. FORSTER is much too important a member of the Liberal party to be excluded from Parliament because he may have failed to conciliate a set of would-be borough-mongers. His speech or lecture delivered before the Chamber of Commerce furnishes perhaps superfluous proof of his fitness to represent an industrial constituency. Criticism to the effect that his arguments were not sufficiently scientific and abstract seems to be misplaced. The Bradford manufacturers are likely to be more strongly impressed by objections to any specific increase of duties which could be proposed.

It appears that the heretical doctrine of reciprocity has made some progress at Bradford as well as in other places. The President of the Chamber of Commerce opened the proceedings by a speech in which he contended that high duties ought to be imposed on the produce of countries which exclude or discourage English goods. There is no doubt that in former times such measures as those which are recorded in CANNING's well-known rhymes were sometimes effectual in securing concessions from foreign Governments. To punish an obstinate neighbour by an additional charge of twenty per cent. on ships or merchandise would now involve a disturbance of settled commercial policy. It is true that commercial treaties are negotiated on the assumption that a country which declines to tax the articles of its own consumption confers a benefit on the producer which ought to be acknowledged by similar treatment. Mr. COBDEN in 1860 wavered between his genuine convictions and his legitimate solicitude to obtain from the French Government reasonable terms of exchange. His treaty has produced much practical good, and perhaps some indirect mischief. The commercial treaties which were afterwards concluded with one another by nearly all the European States were preceded by negotiations in which every party struggled to impose on itself the highest possible rate of charge on foreign imports. The principle of protection was recognized at the same time that its operation was partially abated. Now that the treaties are for the most part expiring, nearly every country proposes to secede some steps further from freedom of trade. Prince BISMARCK designs, for political reasons, as Mr. FORSTER thinks, rather than through economical error, to re-establish in Germany the protective system which was first shaken by the institution of the Zollverein sixty years ago. The French Government has, in imitation of M. THIERS, denounced the English treaty, certainly not with the intention of substituting a more liberal arrangement.

Mr. FORSTER exposed the fallacy of reciprocity with his usual good sense and clearness. If he seemed to admit that something of the kind might be attempted in negotiating a Treaty of Commerce, he only recognized the inconsistency which attends all bargains of the kind when one of the parties is devoted to Free-trade. Even among Continental Governments commercial treaties are not made without frequent embarrassment. Austria and Germany and Austria and France have lately found grave impediments to negotiation, although their respective Governments all adhere more or less firmly to the obsolete doctrine of the balance of trade. Some mention was made at Bradford of a possible treaty with the United States, for

which there are but scanty materials. It is difficult to understand why Congress should stipulate for the free admission of produce which is already free; or for the maintenance of Navigation-laws founded on the opposite principle to that which prevails in the United States. Mr. FORSTER, in the sanguine mood which becomes a public speaker, expresses a belief that Free-trade doctrines are advancing in strength both in America and Europe. There is no harm in hoping for the best; and it is true that thoughtful men in all countries understand the fundamental principles of political economy; but it is not less certain that manufacturers prefer their own profit to the general benefit, and that in almost every country but England the multitude blindly pursues a policy diametrically opposed to its own interests. Even here a zealous advocate of extension of the suffrage may do service by vindicating the doctrines which are most likely to be repudiated by his clients. It is convenient to expose the fallacy of reciprocity, which is the most plausible form of protection.

Mr. C. S. READ has the merit of having been the first to suggest one insurmountable objection to the proposal of reciprocal protection or exclusion. The farmers, in whose name Mr. READ has some right to speak, will never submit to pay taxes into the pockets of manufacturers while they know that they will not be allowed to levy a correspondent tribute on the community. It was because England is divided into large farms forming part of large estates, that popular jealousy of a privileged class took the form of passionate interest in dry demonstrations of the justice and expediency of Free-trade. The Corn-laws might perhaps have survived to the present day if they had been defended from selfish motives by two or three millions of small freeholders. The landlords and tenants, though they failed to maintain an indefensible anomaly, are strong enough to hold the manufacturers to the bargain which was made at the instance of their predecessors in the last generation. Mr. COBDEN's disciples must take the consequences of his having proved their case by unanswerable arguments. Iron and cotton goods are not so absolutely indispensable as bread; but the reasons against artificial dearth apply equally to all commodities. If the agitation for reciprocity should at any time become serious, the farmers will have no difficulty in showing that at the present time they are especially entitled to consideration. The injury to the landed interest which was apprehended during the controversy on the Corn-laws was, through the operation of various causes, long suspended. But the improvement of communications and the cultivation of fresh lands have now almost wholly justified the anticipation that the growth of wheat in England would in default of protection become unprofitable. At the same time the trade in fresh meat is assuming large dimensions, and infringes the apparently natural monopoly of English breeders and graziers. To ask Parliament to admit untaxed grain and meat, and at the same time to tax English producers of food for the benefit of manufacturers, would require great audacity.

Another reason for refusing to impose retaliatory duties is that they would not serve their ostensible purpose. The Protectionists of Germany, of France, and of the United States are comparatively indifferent to the export trade with England, while they are bent on depriving their respective countrymen of the opportunity of importing English goods. When Prince BISMARCK proposes to enforce on all the inhabitants of Germany the use of home-made iron, he is well aware that the produce of which the quality will probably be deteriorated is not likely to find an English market. M. POUYER-QUERTIER and the Rouen cotton-spinners would regard a proposed increase on the duties on Bordeaux and Burgundy wines with the same indifference with which the Irish landlord in the story heard the threat that his agent would be murdered. In almost all cases reciprocal duties would affect a different class of producers from those who gave the excuse for retaliation. English reciprocal duties would especially strengthen the hands of the American Protectionists, who have always played on the patriotic prejudices of their simpler fellow-citizens. The amount of American cotton and iron goods which is now imported into England is comparatively small, though even the commencement of competition may cause some reasonable anxiety. A monopoly given to Sheffield cutlery or to Lancashire calico would discourage the American advocates of Free-trade, while it would do little or no harm to Pennsylvania and New England. It is quite certain that the more valuable imports of food and of raw cotton will not be taxed by an English House of Commons. In all countries, including the English colonies, protection is supported by manufacturers and artisans who with few exceptions neither expect nor wish access to an English market. There are no means of applying to them direct pressure, and they will not be affected by the sufferings of their neighbours.

THE BANK MEETINGS.

SO large a number of the leading joint-stock banks have now held their half-yearly meetings that it is possible to estimate with tolerable accuracy both the general position of these institutions and also the questions with regard to banking as to which there is a reasonable difference of opinion. Almost all, if not all, the banks agreed in not altering the form of their accounts, and in explaining that they adhere to their former custom, not because they have anything to conceal or think greater detail undesirable, but because they are waiting to see whether the Government will not itself prescribe a form for banking as for railway and insurance accounts. In addressing the shareholders, however, the respective chairmen have given a much more minute and exhaustive account of the operations of the last half-year than has been usual. They understood what the shareholders and the public wanted to know, and they supplied the information desired. The general result was in almost all cases the same. There has been a drain to meet the withdrawal of deposits and drafts; but the banks have met this drain with ease. They hold in hand an amount of cash larger than usual in order to be ready for an excessive demand on the part of their customers. Their investments are in Government securities and first-class stocks. They have no large lock-ups. They distribute their business as much as they can. They exercise great vigilance in writing off bad and doubtful debts. They rigidly examine all securities offered them. Even if it is supposed that it is in human nature to err more than bank directors will admit that they err, yet it cannot be doubted that London banking is, on the whole, sound and admirably conducted. The scare as to banks has already died away in a great measure, and the reports of the meetings not only of the large, but also of smaller, banks will do much to remove it. The prevailing distress and slackness of trade have not jeopardized the position of any bank which has been properly managed. But it must not be supposed that the diminution of the liabilities of a bank, or, in other words, the having to find cash to meet the withdrawal of the funds belonging to customers, is solely due to a sudden apprehension as to the stability of the institution with which the customers dealt. This has been one great cause, and it has told most heavily on some institutions with which adverse rumour chose to busy itself. But a still more powerful cause is that small people really want their money. They are using their balances and deposits to tide over bad times. They are, to some extent, living on their savings. Banks flourish by using profitably the savings of other people; and, when these other people withdraw their savings, banks are necessarily crippled. Their money goes out, not quickly, as in a panic, but slowly; and, until the tide turns, banks may have escaped dangers, but they have not escaped anxiety.

The banking questions which recent events and the recent reports and speeches of directors have forced into prominence range themselves under two heads. There are questions that regard the administration of a bank, and there are questions that regard the character of its business and the dealing with its funds. Under the first head fall such questions as how ought directors to be selected? how ought directors to perform their duties? ought directors to be allowed to receive advances? and what check ought auditors to be expected or allowed to exercise over the directors? The shareholders of more than one institution have complained that the Board always really elects the newcomers, and that they become a packed body; and they have freely pointed to the history of the Glasgow Bank to illustrate the evils of this, and explain that the wire-pullers of a Board where mismanagement is going on can always contrive in this way to secure the co-operation either of a rogue or a dummy. The answer to this is that, if the

institution is supposed to be mismanaged, the appointment of directors of whom the Board knew nothing until they were appointed would act as a powerful check on contemplated misdoing. But, if the institution is supposed to be well managed, all it needs is that a new director should contribute to the goodness of the management. This is much better secured by the Board electing, subject to the ratification of the shareholders, than by the haphazard nomination of an irresponsible knot of shareholders. How directors should conduct their business may be known by reading such a statement as that made by the Chairman of the London Joint-Stock Bank, when he described how his Board managed the bank. The essence of the system is that every director shall be so employed in rotation that he must become acquainted with the past history and present business of the bank. There are to be no dummies, and every director is to watch every other. There are two weak points in this system. Directors are to be found who are admirable adepts in the art of going through business without either understanding or criticizing what they are invited to do; and as all that happens if a director does not take his turn is that he loses his fees, and the fees given to bank directors are often extremely small, the indolence of a dummy may prevail over his wish to pocket a few guineas. But if directors are both competent and zealous, the system described is perfectly effectual, and anything like gross mismanagement is impossible. It is, again, a great mistake to suppose that the shareholders or the customers would gain by subjecting the operations of such a Board to the perpetual control of auditors. The business of auditors is to see that the statement made by directors as to the periodical results of their operations is a true statement. Shareholders have first to determine, or let the Government determine for them, what directors are to state, then to see that the required statements are made, and, lastly, to see that auditors competent to perform the duty certify to the truth of the statements; and one auditor at least should always be a professional accountant.

As to the propriety of allowing directors to receive advances from the bank they govern there has been a great difference of opinion manifested at the recent meetings. One of the heads of the indictment against some of the Directors of the Glasgow Bank is that they exhausted the funds of the bank by procuring advances to be made to themselves, which, if the bank had been properly conducted, the Board would have denied to ordinary customers. That advances to directors may be so made as to taint the advances with embezzlement is obvious, and no one can for a moment defend such advances. But are advances to directors altogether wrong? Some banks appear altogether to prohibit such advances. Others lend to firms of which directors are partners. Others lend to directors, but exact security more ample than would be required from outsiders. Others appear to treat directors as ordinary customers, but to limit the amount advanced. To guard against abuses, and still more against the suspicion of abuses, far the best thing for the bank and far the pleasantest thing for the Board is that no advances should be made to directors. But there is nothing morally or legally wrong in taking the business which directors bring to their bank, provided that it is really sound business; and loans and discounts may form not only a legitimate, but a necessary, part of such business. To ensure that they are guided simply by the soundness of the business, and not by favour or tenderness, the rest of the Board may wisely require that extra precautions shall be taken when a colleague is applying for an advance; but there is nothing dishonourable or improper in allowing a director to have that accommodation from his own bank which he could obtain without the slightest difficulty from any other bank. To deny him this accommodation altogether is to lay down that a trader shall not bring the best business and connexion which he can command to the bank which he is not only governing, but striving to make prosperous and powerful.

An equally wide variance of opinion seems to exist as to whether giving its acceptances is a proper part of the business of a bank. The Chairman of the London and Westminster laid down that it could scarcely be called a proper part, and announced that, although his bank did some business of the kind, it only did it on a limited scale, and that, in his opinion, the giving of acceptances was the business of a merchant, not of a banker. On the other hand, the Chairman of the Union described the giving of acceptances as the largest, safest, and most lucrative part of the business of his bank; and the Chairman of the London Joint-Stock not only gloried in this part of his business, but took special credit for his Board in that it had been the first to discover the excellences of this sphere of operations, but had been very reticent about it, lest others should discover the lucrative secret. Many banks seem, as a rule, to think the secret which has now long been disclosed is a lucrative one, and they use it in proportion to their means and to their ability to get bills of a proper kind offered to them for acceptance. It may be observed that what is meant by the acceptance of a bill by a bank is to a certain extent a different thing from the acceptance of a bill by a merchant. The bill tendered to the bank has already gone through the process in which the merchant plays his proper part. The bill is already a legitimate trade bill, and is drawn against value, or the bank would not look at it. What the bank does is to guarantee that it shall be paid. In a very large number of cases it is another bank that forwards the bills to the guaranteeing bank. The operation is, in fact, very much as if on the back of a note of a country bank having the right of issue there were written the words "guaranteed "by the Union Bank." The object of purchasing the guarantee is to make the document worth cash in any part of the world; and in order to procure this advantage those who apply for it are ready not only to pay a proper commission, but to lodge with the guaranteeing bank the most ample security. All the banks that sell this sort of guarantee unite in asserting that, so far from being a risky business, it is exceptionally safe, and that they have never lost anything by it. There are of course merchants who can go through the same process, and whose guarantee, in the form of an acceptance, will make a bill at once marketable anywhere. Their names are so good that they can do what the Union or the Joint-Stock can do. But, when they go through the process and are paid for it, they seem to be acting, not as merchants, but as capitalists. It is because they are known to be very rich and very prudent that their names have this value. Either a merchant or a banker might so abuse the practice as to make it the cover of a network of accommodation bills. But eminent merchants and sound banks do not so abuse it; and when they use it cautiously and properly, there not only appears to be very little risk in it, but the capacity in which they adopt it is the same. They are equally capitalists turning the reputation of possessing great capital into a profit.

THE BELGIAN EDUCATION BILL.

It has long been plain that, whenever the Liberal party gained a majority in the Belgian Chamber of Deputies, an attack would be made on the existing system of primary education. That system has the fatal fault, in the eyes of a Belgian Liberal, that it allows the Church a very considerable share in the management of elementary schools. Partly by the system of clerical inspection, and partly by the permission accorded to the communes of adopting schools taught by members of religious congregations, the clergy, in districts where the Catholics are in a majority, have been able to make education an important instrument in maintaining their hold upon the population. To a Belgian, and indeed to a Continental, Liberal this appears a horrible perversion of state influence. Whether he is or is not in favour of the entire separation of Church and State, he is almost certain to be in favour of that partial separation which is involved in the complete secularization of education. The opportunity has at last come, and on Tuesday the new Education Bill was laid on the table of the Chamber of Deputies. It must not be supposed, however, that it represents at all an extreme phase of secularist policy. It is one of the unfortunate results of the position which the Roman Catholic Church has recently taken up in Belgium that she has turned many who might have been her friends into declared adversaries. The present Belgian Ministry, though it has come into power on distinctly anti-clerical principles, is composed of men who in any other country would be regarded as moderate politicians. It may be doubted, for example, whether the Liberal Cabinet in Belgium is really more anti-clerical

than the Left Centre Cabinet in France. The consequence is that the new Bill, though it will be studiously represented as designed to break the power of the clergy, is really a compromise somewhat of the English type. If indeed the clergy set themselves strongly against it, as it is probable they will do, it will admit of being administered in a way that may be very injurious to the Church. Whether, however, it will be so administered, except in a few towns where religious passion runs unusually high, and where the Liberals happen to be in a majority, is more doubtful. Even if it is, there is always a great chance that where parties are so equally balanced as they are in Belgium, the first symptom of persecution sends over to the side against which it is directed sufficient votes to get the law modified, or its application controlled. Where there is no desire to provoke a quarrel, neither side will be in the least compelled to rush into one. Only a little sense and a little forbearance are required in order to make the new Bill a very harmless measure. It must be admitted, however, that neither sense nor forbearance are at all common qualities in such quarrels as that in which every Belgian seems bound to take a part.

That the Bill is not a very formidable piece of legislation will appear when we say that its principal provision is unconsciously modelled on a suggestion made many years ago by Dr. HOOK. After enacting that there shall be in every commune at least one primary school, and that the actual number shall be fixed by the Government after hearing the representations of the Communal Council, it goes on to say that religious instruction is in future to be left to the care of families and of ministers of religion, and that in each school a room is to be placed at the disposal of the ministers of various religions in order that they may give religious instruction to the children of their communion who attend the school either before or after the hours devoted to secular instruction. This provision will no doubt excite immense hostility on the part of the clergy. They will see in it a double insult—first, that they are excluded from teaching the children, as heretofore, in the school and during school hours; and, secondly, that in the permission extended to them to use the school before or after school hours, ministers of all denominations are included. It is quite possible that, in communes where the authorities are of an aggressive disposition, the regulations may be made as inconvenient as possible to the clergy; and that, where a Protestant minister has to have an hour assigned him, he may be made to take precedence of the priest, though one may have six children to teach and the other a hundred. The clergy may have a difficulty also in getting their scholars together. It may make a great difference to the number of children attending religious instruction, whether the parents are required to take measures to prevent them from remaining at school after the secular lessons are over, or to take measures to see that they do remain. In the former case a child, unless the priest is extremely popular, will naturally go home as soon as it can; in the latter it will stay on unless the parent has given express notice to the teacher of the school that he does not wish his children to attend the religious lesson. It will probably rest very much with the communal authorities to determine which of these courses shall be taken. If they give notice that a room will be reserved in which the parish priest may give religious instruction to all children whose parents have signified their desire that he shall teach them, a large number of lukewarm or indifferent parents may take no notice of the permission. If, on the other hand, the notice runs that religious instruction will be given after school hours by the parish priest to those children whose parents have not signified their desire that their children should be taught by a Protestant minister, or not be taught religion at all, lukewarm or indifferent parents will have to take some positive step to withdraw their children from religious instruction, and this they will probably be too careless or too indolent to do. On the whole, it would seem that the policy of the Church in Belgium is to accept this provision, not of course as so good an arrangement as that which now gives the clergy so much power in schools, but as a more favourable one than might have been expected from an avowedly anti-clerical Ministry. It is more probable, however, that the clergy, having been accustomed for some five-and-thirty years to larger rights, will interpret the compromise proposed by the MINISTER of PUBLIC INSTRUCTION simply as a challenge which they may not be able to meet with the proper defiance now, but must not sit quiet under a moment longer than they can help.

In that case it is plain that the more extreme Liberals will not consider the present Education Bill as in any sense a final measure. Indeed they are already greatly exercised about the right given to the clergy to use the school buildings for religious instruction. They do not like to oppose the Bill, because they admit that it is an immense improvement on the present state of things. It is much to have the priest shut out from the school during school hours, to have the system of ecclesiastical inspection and the censorship of school books by the bishop altogether abolished, to have religion no more taught in training schools, and to have the communal authorities forbidden to adopt a Church school as the school of the commune. But these gains have not been secured without a melancholy amount of concession. That the priest should have the right of entering the school building after the secular lessons are over, and giving religious instruction to such children as stay to be instructed, seems to a Belgian Liberal a tremendous imprudence. "We fear," says the *Indépendance Belge*, "that the priest once admitted to "teach in the school building will soon recover all the "authority with which the law formerly invested him." The true spirit of Continental Liberalism speaks in this sentence. In theory Continental Liberals are all for freedom of conscience and the concession of equal rights to all religions. In fact, they usually shrink from applying their formula to the religion with which they have most to do. The inconsistency between their preaching and their practice has usually been concealed by the fact that the Roman Catholic Church has demanded much more than the Liberals are bound by their theory to give her. She has not been content with a fair field and no favour; she has asked that her rivals should be kept out of the field, and she alone allowed to occupy it. But as soon as circumstances allow the Liberals to apply their doctrine the inconsistency is revealed. They are afraid to give the Roman Catholic clergy the liberties which they are bound by their professions to extend to all mankind. However convenient it may be that the priest should come to the school to give religious instruction to the children of his own creed, he must be kept away lest his teaching should be too popular and too influential. Freedom of thought is at present so tender a plant in Belgium that it must be protected by prohibitive legislation. There is far more real difference between the Belgian Education Bill as the Government have drawn it and the wishes of the extreme Liberals than there is between the Bill and the state of things which it proposes to abolish.

NOXIOUS VAPOURS.

WE do not know how many years the Manchester Association for controlling the escape of noxious vapours and fluids from manufactories has been in existence, but, judging from its subscriptions, it has not yet passed beyond the day of small things. The receipts for the past year have been 165*l.* 1*s.* 5*d.*; and, considering the wealth and resolution of the interests against which the Association has to wage war, this must be regarded as a somewhat slender equipment for the contest. Yet, though its operations must necessarily be on a very small scale—supposing, that is, that it cuts its coat according to its cloth—it is at any rate an advantage to have an association of the kind at work in Manchester. If the inhabitants of the districts injured by noxious vapours show no sense of their own miserable condition, and no effective desire to escape from it, they can hardly look for help to those who are not themselves sufferers. Occasionally, when some district of peculiar natural attractiveness is spoiled by trade nuisances, something like a general protest is raised, though usually with but little result. But, generally speaking, there must be evidence of suffering felt as well as of suffering inflicted before people at a distance feel any keen interest in the subject. The ordinary idea is that, if no one cries out, no one can be hurt; and that, if no one is hurt, there can be no pressing need for interference. The notion is an incorrect one, because there can hardly be a greater proof of the injury which results from living in unwholesome conditions than the loss of the power to realize that they are unwholesome. Acclimatization is a benefit in

one sense, inasmuch as, if a man has to spend his days in an atmosphere which the sun rarely penetrates and amid stenches which turn a new comer sick, it is well that he should cease to be sensitive to them. But, if it is a good thing for the individual, it is a bad thing for the race. It is bad because the race gradually deteriorates under these noxious influences; and the effect of acclimatization is to conceal this deterioration from those exposed to it. The keenness of sense which realizes the fact that they are noxious gets deadened; the energy which resents the injury and sets the sufferer to work to get them removed grows weaker. Any evidence, therefore, that use has not lessened that indignation against noxious vapours which it is at once so important and so difficult to retain in its original vigour is to be warmly welcomed. From this point of view the proceedings of the Manchester Association deserve commendation. During the year 1878 the Association has been in conference with similar Associations in Warrington and Liverpool; and their deliberations have resulted in an agreement upon the principal points on which the recommendations of the Royal Commission stand in need of amendment or addition. These proposals are valuable as showing what steps ought to be taken in the opinion of those who have suffered most from noxious vapours, and who may therefore be supposed to be most familiar with the causes which have hitherto availed to prevent their suppression. They may be wrong in their estimate of the remedy, but they at least know what it is to suffer from the disease.

The first request of these combined Associations is that the liability of manufacturers should be made collective. It is obvious indeed that, unless this is done, compensation for injury will very rarely be obtained. Vegetation is destroyed by a wave of noxious gases which may come from one factory or may be contributed to by twenty. Of course, if it can be shown that only one was really in fault, one only ought to make compensation. But suppose it is impossible to prove that only one was in fault—supposing, that is, there is more than one factory from which gas is known to have escaped about the time when the injury was inflicted or in which the appliances for preventing the escape are defective, it is plainly unfair that the owners should escape simply by reason of their multitude A law which made the liability of manufacturers collective, and, in the absence of proof that the damage actually done, and which might have been done by all or any of the works lying within a certain range of the property injured, had been done by any one or more, made all the owners of works within that range liable to pay their share of the compensation, would have the advantage of creating a strong professional feeling against the man who by going on with defective works, or by employing incompetent workmen, had brought his neighbours as well as himself into trouble. Carelessness in either of these respects would thus imply indifference, not merely to the injury done to strangers by the discharge of noxious gases, but to the injury done to a brother manufacturer. Another point touched on in these joint resolutions is the imposition of a check upon the further multiplication of offensive industries. The Committees propose that no new works should be established, and no additions made to works already established, without the license of the Local Government Board. So long as the discharge of noxious vapours cannot be certainly prevented, this is a perfectly reasonable request. A factory which may at any moment destroy vegetation for a considerable distance round it, and make life extremely uncomfortable, is, to say the least, a potential nuisance. When it has once been set up, it cannot be closed without doing harm to the vested interests which have grown up around it, and the utmost that the law can then do beneficially is to enforce the observance of the best appliances for rendering the discharge innocuous. But when the question to be considered is not whether an old factory shall be closed, but whether a new factory shall be opened, the case is different. No individual suffering will be caused by the new factory not being opened. The only result will be a possible loss to the wealth of the country from the non-extension of a particular industry. It is a balance of considerations. On the one side there is the advantage that results from the development of trade; on the other there is the injury done to the health of the district by the form which it is proposed that this development of trade shall take. We will concede that it may be hard to say in any given case to which side the scales should incline; all we wish to insist on is that they do not, as a matter of course, incline to the side of setting up the factory. The district may already be so crowded with nuisance-causing industries that the addition of another would be the last straw laid on the backs of the unfortunate inhabitants; or the district may be so entirely free from any disfigurements of the kind, and so beautiful in itself, that it is of the utmost importance to the whole country that it should be kept in its present state. In one case the density of the population may be a reason for not setting up a factory likely to discharge noxious vapours; in another the reason may be the solitude of the district which it is proposed to invade. A question of this kind, involving as it does the careful weighing of advantage against advantage and of injury against injury, is precisely the sort of question which ought to be left to the decision of the Government. It is impossible for the persons immediately interested on either side to approach it with a sufficiently unbiassed judgment.

The Royal Commission, it will be remembered, found it impossible to arrive at any conclusion as to the relative merits of central and local inspection. The resolutions of the joint Associations suggest a compromise between the two systems which has many recommendations. If the Inspectors are appointed by the Local Government Board, they must be paid out of the Imperial Exchequer; and against this may be urged the natural objection that the inhabitants of districts in which there are no works emitting noxious vapours ought not to be taxed for the protection of districts in which there are such works. As the benefit of inspection is local, the cost of it ought also to be local. On the other hand, if the Inspectors are appointed by the local Sanitary Authority, they will often be appointed by the representatives of the very men whose works they are to inspect. If central inspection distributes the charge unfairly, local inspection makes the process a sham, and so renders it useless to impose the charge at all. The proposal of the Associations is that the appointment of the Inspectors of noxious works should be vested in a County Board, or, where it happens to be more convenient, in the County Boards of two or three adjoining counties, with the sanction of the Local Government Board, and that the expenses of such inspection should be defrayed partly by a county rate and partly by a grant from the Treasury. By this means they think that the number of Inspectors may be so far increased as to allow of their residing within a short distance of the works under their care, and being thereby enabled to see or smell for themselves any unusual discharge of vapours, and to visit the works by night as well as by day. It is plain that, without some importation of the local element into the system of inspection, it would be impossible to invest it with proportions like these. The House of Commons would never consent to charge the whole body of its constituents with the entire cost of protecting a minority of them against local injuries. In counties where works discharging noxious vapours exist, a County Board will be sufficiently interested in the subject not to mind defraying the cost of inspection by which certain inhabitants of the country benefit, while at the same time too many interests will be represented in it to make it the mere creature of the manufacturers whose management of their works is impugned. These two facts point to this as, on the whole, the best way out of the difficulty that is likely to present itself.

PROFESSOR TYNDALL ON THE ELECTRIC LIGHT.

If the crowd of seekers for admittance to the evening lecture at the Royal Institution on Friday last were a safe indication of the interest taken by English people in science, it would augur good things for the future of science in England. No sooner were the doors opened (though more than an hour before the time fixed for the lecture to begin) than the whole space available for the public was filled, and the lucky possessors of places thought that their good fortune was cheaply purchased at the price of an hour's patient waiting in a room whose ventilation even yet exists rather in the realm of scientific imagination than of reality. But there were other causes at work to produce this sudden enthusiasm than the mere love of science. The lecture was to be given by one who is certainly first favourite in England as a scientific lecturer, and the subject was one which has suddenly been invested with surpassing interest, not so much among scientific circles as in the world at large. The case of the electric light is similar to that of the telephone, in which the general public is suddenly brought face to face with a scientific discovery brilliant with mingled promise and performance, and learns, with something

between delight and terror, that science has still in store surprises which may transform the apparently so firmly fixed lines of our daily life and lead to widespread modifications of the habits of our existing civilization. It is not to be wondered at that, under such circumstances, there should be a general rush to the accredited authorities in science to learn what all this may mean, and to get some guidance which may serve to distinguish the true from the false in the prophecies which are so rife, all of which seem to the uninstructed equally impossible or equally probable according to the disposition of the hearer. So that it will surprise no one that the number of persons who, though members of the Institution, were unable to obtain seats was so great that the lecture had to be repeated on Monday last.

Professor Tyndall has earned well the position he occupies as a scientific teacher. His life has witnessed the discovery of all the great generalizations which have in modern times revolutionized physics and given to the scientific mind of to-day an appreciation of the unity of nature which would have been impossible in past times, and could only have been even suggested by the most superficial thinkers who owed the breadth of their views to their lack of depth and want of acquaintance with the difficulties of the subjects of which they treated. And during all this time he has been in the thick of the battle, and has probably done more than any other man to spread the knowledge of these great physical laws, and to make their nature and supremacy a part of the lore of every educated man. From this has arisen in him a passionate enthusiasm for these great fundamental truths, and a strong distaste for regarding scientific subjects from any other point of view than their relation to them. It is this quality, combined with his real genius for exposition, which makes him so skilful in devising experiments to illustrate his lectures. No one is more conscientious in refusing to shirk, or to allow his hearers to shirk, any of the real difficulties that beset the thorough comprehension of a subject; but, on the other hand, no one knows so well how to distinguish between such difficulties and questions which after all relate only to subsidiary details, and which, if brought into prominence, would only serve to distract the not-too-well-informed hearer and divert his mind from the main principles. This leads him to choose as illustrations of his lectures experiments which, as it were, exemplify the principles of his subject nakedly and in a form which is as little complicated as possible with secondary and subsidiary actions, so that the experiment itself is eloquent, even to the dullest brain, of the truth it is intended to tell. And in all that he does it is easy to see the effect of his training under Faraday, who to his genius for divining great laws added a power peculiar to himself of presenting them to the mind in a way which seemed to give to them a physical embodiment, to clothe the naked abstractions and turn them into actual physical existences. The reflex of this is seen in all Professor Tyndall's lectures on physical subjects. There is a vividness in the pictures drawn by him which makes all his audiences recognize the forces of which he is speaking as actual living realities, and thus to follow out their effects as they would never have been able to do had they received them merely as abstractions deduced from observation of the concomitant variations of certain natural phenomena. Hence, if any one cannot understand science as expounded by Professor Tyndall, he need go to no other teacher, but had better give the matter up.

It was quite necessary that the lecturer should be one gifted with rare powers of exposition. For, in the consideration of the question of the electric light as it has recently come before the public, we are brought face to face with a phenomenon which involves all the difficulties and mysteries which surround electric action. And there is no way to avoid them. No doubt to the scientific thinker there are difficulties almost as great in the theory of the galvanic battery or even in frictional electricity. But such difficulties as these are deep-seated, and do not trouble the ordinary mind, which has grown to feel no surprise that two different metals immersed in an acid solution should set up a current in a wire joining them, or that friction should electrify glass. But in this question the difficulties of action at a distance and the mysterious kinship between the galvanic current and magnetism are so palpably involved that they cannot be avoided, and there is at present no established formula which is a sufficiently accredited explanation to induce people to imagine that they understand it when they do not; so that persons of ordinary intelligence have no other alternative than either comprehending the matter or being conscious that they do not. These remarks apply to the new methods of generating electricity, and not to the electric light properly so called, which is of course a matter wholly independent of the source from which the electricity is derived; but the peculiarity of the present crisis is that it is not in the least due to discoveries relating to the electric light. It is scarcely an exaggeration to say that nothing new has been done with respect to it for the last twenty years, and there can be no doubt that most of the recent patents relating to it will be found to be worthless, from having been long ago anticipated. All that we now know of it we have known for a long time. The rush of inventors to it is similar to the rush of miners to claims in some long-ago-discovered field which had been abandoned from its having been found not to repay working, but which has been opened up by subsequent changes in the facilities of transport. The real interest of the present crisis is concentrated in the generators that are used to supply the electric lights, and nothing is more interesting from a scientific and industrial point of view than the extraordinary developments in dynamo-electric machines which have suddenly placed electricity in the foremost rank of the economic agencies of the world, rivalling even the giant steam and its less known, but not less interesting, coadjutor, modern hydraulics.

The character of Professor Tyndall's lecture faithfully reflected this state of facts. Singularly complete as was his summary of all the competitors for the fame and profit of rendering the electric light applicable to the ordinary needs of civilized communities, it resembled nothing so little as an expert's discourse upon the comparative advantages and disadvantages of the various kinds of electric lights or the relative merit of their inventors. Not that the importance to the world at large of such practical applications of the knowledge which we possess of the properties of electricity was at all undervalued by the lecturer, or the merit of the authors of such applications treated lightly. On the contrary, the lecturer's admiration both for the inventors and their works showed itself perpetually throughout the whole lecture. But the praise they received from him must have sounded strange to those of his audience who shared the vague ideas relative to the electric light which are rife among the general public—namely, that it is something which was first discovered some nine months ago, and that gas shares fell greatly in consequence of this discovery. The whole question of the rival systems of electric light was dismissed in a rapid review which just glanced at the special contrivances which characterized each, and his criticism consisted of a good deal of general and very little special commendation. The lecturer could not and did not even desire to leave the position of the *savant* and take up that of the mechanical engineer. The greater or less ingenuity displayed by the various inventors in minimizing the evil consequences of the many troublesome peculiarities of electricity when used as a light-generator, however interesting to him as a proof of human skill, were, after all, well-nigh as foreign to the point of view from which he regarded the subject as would have been the artistic merits of the fittings of their lamps. So soon as he came to some new scientific principle it was at once brought into prominence and received due honour. But mere mechanical arrangements, whose sole merit consisted in the skill with which they utilized well-known forces, won from him little more than the briefest word of commendation. And thus the whole question of electric lamps received such scant notice that, if we were to find any fault with the lecture, it would be that the lecturer declined completely to humour the audience by dwelling at more length on the part of the subject which would have the greatest attractions for the majority of them. But the fact is that, in addition to its not possessing much novelty, the question of the lamp in the electric light is not an interesting one from a scientific point of view. It is a mere detail in the theory of producing light from electricity, and although future discoveries as to the nature and properties of the electric arc may wholly alter the matter, the present state both of knowledge and practice makes it impossible to impart any scientific interest to an examination of this part of the subject.

The theory of the electric light is capable of being expressed in a few words. Thanks to the mutual interchangeability of all forms of force, we are able to transfer force from one place to another in one shape, and at the end of its journey to use it in another shape, just as we can send money by post in the form of notes and get it changed into gold at its destination. But, whatever be the form in which we seek to effect the transference, some portion is lost or dissipated on the road; and, moreover, the transformation at the end is not usually effected without further cost. If we transmit the force in the shape of heat, there is the loss by conduction or radiation; if by motion, there is the loss from friction. Again, if, at the end of its path, we wish to use our force in the shape of heat, it is obviously disadvantageous to transfer it in the form of motion, as there is no easy method of transforming motion into heat, especially if a high temperature is desired. To solve all these difficulties, we turn to the electric current, which is beyond all comparison the form of force which offers the greatest facilities for transmission (if we except such forms as combustible or explosive substances), just as heat is probably the worst in this respect. It is true that there is a definite loss during the transmission. However large in section be the conductor through which the electric current passes, it offers some resistance to the electric current; and the amount of force which is taken from the current and changed into heat and thus dissipated is exactly proportional to this resistance; and herein resides the whole history and mystery of the electric light. Not only does this property enable us to diminish without practical limit the loss during transmission by the simple means of providing substantial copper wires to convey the current, but it enables us to turn exactly as much or as little of the force contained in the current into heat at the precise point or points we desire. If the materials would stand the heat it would be a simple question in proportion to decide on the dimensions of a platinum wire which, when placed in a given circuit, would be raised to any given temperature up to the intensest solar heat; it would merely be necessary to ensure that it should be of dimensions small enough, and have sufficient resistance to force the electric current to give up the heat requisite to effect the desired increase of temperature. By no other means and in no other form can we convey force to a small body, and, by changing it suddenly into heat, raise the small body alone to an intense and constant heat without its being in the neighbourhood of other hot bodies. All electric lighting consists in the application of this principle to practice, and the different systems differ only in the means by which the requisite resistance is produced. Of the three types of lamp at present in use, one (to which it is supposed that

the alleged inventions of Mr. Edison belong) produces the required localized resistance by means of fine wire of some refractory metal, which is a very bad conductor, such as platinum or iridium, or a mixture of the two. Another produces that resistance by forcing the current to pass along a fine piece of charcoal, either (as in the Sawyer and Mann lamp) in the form of a thin needle placed in an atmosphere of nitrogen to prevent combustion, or (as in the Regnier and Werdermann lamps) by passing it through a finely-pointed pencil of carbon, which touches a larger piece, and in which the effect of combustion is neutralized by the gradual advance of the thinner carbon. The third type, to which all the more important forms belong, produces the required resistance by compelling the electricity to pass from one carbon point to another over a very short interval of space, which is bridged, no doubt, by incandescent particles of carbon torn from the carbon points by the electric current, and carried with it in its course. The resistance afforded by such an interval, and consequently the degree of heat generated within it, is enormous, and thus the particles of carbon are raised to a heat which makes them give out light of the intensest whiteness. Unfortunately the resistance, though always enormous, is subject to great fluctuations, due to minute impurities or inequalities in the carbon, and this may increase the resistance so much as to stop the current altogether, and thus extinguish the lights; or, on the other hand, may diminish the resistance so greatly as to cause the light to sink; and thus it is of the greatest importance to remove or minimize these fluctuations, and each of the different systems that fall under this head has a different device for effecting it. But, as we have said above, the whole matter consists in producing a sufficiently great and constant resistance in a sufficiently small space; and it is not surprising that Professor Tyndall did not seem to linger lovingly on the trifling peculiarities of the *modus operandi* chosen by the several inventors for the purpose of attaining this desired result, however great the practical importance of their success.

When we turn to the question of the generators of the electric current which supplies the electric light, we find a very different state of things. Nothing can exceed the scientific interest of the gradual development of dynamo-electric machines, from the little roughly-made instrument which was exhibited on Friday night, from which Faraday got his first magneto-electric spark, to the enormously powerful machines of Gramme and Siemens which produce torrents of electricity capable of sustaining a light of many thousand candles. The history exemplifies in the most perfect manner how gradually the human intellect learns to grasp the full meaning of the truths at which it has arrived, and how slowly it feels its way to the full appreciation of the new powers that it has acquired. Without any theoretical addition to the discoveries of Faraday, every step in advance taken by Wilde, Holmes, Siemens, or Gramme was a new revelation of the meaning of these discoveries; and, though logically they were strictly deductive in their character, and necessarily rank far below the great inductions upon which they were founded, they are worthy of, and have always received, the highest scientific honour. The lecturer both felt and showed this. He carefully followed out in his best manner this development in all its detail, illustrating the progress made during each epoch by references to his own experiences as adviser to the Trinity House, in which capacity he had better opportunities of studying the earlier attempts to render the electric light practically useful on a large scale than any other person, and in connexion with which the first application of dynamo-electric machines to electric lighting took place. And not only the lecturer, but his audience, must have felt the charm of mystery that attends this subject. The most ignorant cannot suppress a kind of awe at the invisible agency that will make a powerful steam-engine groan and labour over turning a bobbin of wire that a child would seem to be able to spin round, and that a child could actually spin round if a small incision were first made in it. On seeing an engine whirling round the armature of a dynamo-electric machine with the greatest ease when the machine is not in electrical connexion, and then suddenly brought up and made to labour and strain as though an immense load had been flung on to it by unseen hands, and knowing that this change has been wrought by the mere gentle contact of a slip of copper with the axle, one is reminded of the fairy-tales where the Brownies, to punish some waggoner who has offended them, make his horses strain in vain to pull the waggons that should be but trifling loads to them, or suddenly root him fast to the ground, without his being able to feel his bonds. While dwelling on this marvellous result of the work of Faraday, which in its earlier stages seemed so little likely ever to be of interest to any but the purely scientific world, it was not in human nature to resist the temptation of a fling at the Comtists, who would let a hierarchy decide on what scientific studies should be prohibited, on the ground that the student's time belongs to humanity, and must be spent only on subjects that will be profitable to it. It would scarcely be worth while to show up the absurdity of our scientific studies being directed by a "bench" of bishops, Comtist or other, were it not that, thanks partly to a happy ignorance that prevails in England as to the true tenets of the sect, and partly to the lofty intellectual position, high above all such "bugbears of a weak mind" as consistency, which is assumed by their writers, they have frequently been taken to be a portion of the advanced scientific school, and men of really liberal views have been held responsible for their absurdities. But with this exception there were no polemics in the lecture, though a strongly accented abstention from the discussion of the rumoured inventions of Mr. Edison might well be taken as a sufficient indication of the lecturer's feelings on the propriety of discounting the merit of unperfected inventions for the fame procurable by sensational telegrams. This must have been some solace to aggrieved holders of gas shares, if any such were present; but the enlightened amongst them might have derived much more substantial comfort from the fact that the electricity that was working the lamps before them was generated by a large gas-engine, and they might have reflected with not unpleasurable feelings that the night upon which by far the largest quantity of gas was consumed at the Royal Institution since its foundation was the one which was devoted to the glorification of the electric light.

THE BEST FELLOW IN THE WORLD.

WHEN mothers of large families contemplate the futures of their sons, mentally deciding that one shall be a Prime Minister, another an Archbishop, and so on, they are apt to forget one of the highest of the liberal professions. Surely even politicians and ecclesiastics of the highest rank cannot claim precedence of the Best Fellow in the World. Men sometimes attain to the two first-named positions without any natural qualifications for them; but Best Fellows in the World—like poets and Two-Headed Nightingales—must, as the phrase goes, be born so. In their cradles they may, or they may not, exhibit any marked symptoms of sociability, but at an early period of their boyhood they are pretty certain to show an anxiety as to the enlargement of their acquaintance, rapidly acquiring the art of self-introduction, and converting speaking acquaintanceships into friendships. At the seaside they soon embarrass their parents by the number of their intimate companions, and still more by their familiarity with the adult belongings of their little friends. When sent to school they are completely in their element. If there is a club, they manage to get into it; if there is no club, they found one. They are not naughty boys, although rather idle, as the act of sinning in itself offers no attraction to them; but they will commit iniquity with others for the sake of good-fellowship, after which they will bear a flogging with the greatest good-humour, feeling neither a sense of shame nor ill-will towards the operator. If a boy of this type is happy at school, he is still happier at the University. There his taste for clubs becomes even more developed. Before his second term is over, he contrives to be elected to the most select of those institutions at his college, and his third term most likely finds him its treasurer or secretary. He reorganizes the club dinners, and puts the accounts on a better footing. Eventually he becomes president, and then it is necessary that every young man coming up to his college, who wants to "get on," should be placed under his special patronage, and he becomes a sort of collegiate foster-father to half-a-dozen young noblemen. Young men of large fortune are indebted to him for many benefits, such as election to the clubs, and introduction to the best sets. So many favours of this kind has he to bestow that it is needless for him to put himself to the expense of extravagant entertainments. Indeed at the club dinners, college balls, and reunions of old public schoolmen he always seems to act as host; therefore he has little occasion for the exercise of private hospitality. Most of his fellow-undergraduates would consider it a greater honour to eat a mutton chop in the select privacy of his quietly furnished rooms than to feast at a gorgeous supper table in any other quarter of the college. When the peerage and baronetage are guilty of some midnight escapade which has been discovered by the authorities, he is selected as champion to beard the Dean. His gentlemanlike apology, combined with the recollection of the rank of his clients, easily mollifies that functionary, and "best fellow in the world" scarcely seems a high enough title for him when he announces their pardon to his impeached comrades. It is needless to say that he has plenty of invitations to the homes of his companions. He is dubbed a "good fellow" at great country houses, and is found to be an adept at making things "go off well." He thus gets splendid opportunities of making the intimate acquaintance of the most desirable young ladies—an advantage which, sooner or later, he is pretty certain to turn to profitable account. When he goes into the army, he is good-natured in taking duty for any young swells who want extra leave, and he is indefatigable in doing the troublesome work of getting up balls, theatricals, or pic-nics. He reforms the mess and the cellar, and manages the regimental steeplechases. Being very smart and soldierlike in appearance, he is selected as aide-de-camp to a general, and spends most of his time in accompanying that official in his rounds of reviews. If he remains long enough in the army, he becomes a popular colonel, and fathers are anxious to get their sons into his regiment. When he happens to be an eldest son, and the heir to a large property, his accession is quite an event. His country house soon becomes famous for its pleasant parties. Only "nice people" are to be met there, and the men and women are sorted and arranged in the most judicious and diplomatic manner. Of course he is chosen by his political party to stand for his county, and he not only gets in with flying colours, but shows such an aptitude for canvassing that his services are sought by candidates in other constituencies. In the House of Commons it is soon discovered that he is the very man to make a good "Whip," and, although he never obtains a seat in the Cabinet, nor even speaks, he is a good deal behind the scenes in the management of his party, and has a

finger in many elections. He makes a popular master of hounds and is steward of half-a-dozen race-meetings. This kind of thing goes on until he gradually relapses into the "dearest of old gentlemen," when he becomes almost more popular than ever. The most beautiful girls and the gayest of young men vie with each other in petting and spoiling the old "evergreen."

This is one side of the picture. It represents its subject as immensely popular and universally successful, and it is little, if at all, overdrawn; but the halo of virtue which surrounds his head is, morally speaking, of rather a lime-light order. All his generosity is reflective, and his very unselfishness is lent out on interest. He is good-natured, but his good-nature is strictly professional, and he expects his fee for its practice, as much as a doctor or lawyer, and if as a philanthropist he is a fine operator, he expects to be paid accordingly. He looks upon humanity simply as a box of tools, and estimates every man only so far as he is likely to prove of service to himself. Early in life he takes good care to make his reputation for kindness and good-nature so secure that he can afford to drop a friend without danger to himself whenever it may be convenient to do so. If it is reported that he has cut an old companion to whom he is indebted for past favours, plenty of people are ready to say that he is much too good-hearted a man to have done such a thing without very good cause. With the peerage and baronetage he makes it his special business to keep on excellent terms; but he is too shrewd to incur the odium of being a tuft-hunter. He therefore fraternizes ostentatiously with a large number of commoners, and he takes good care to choose these entirely from among successful toadies. As he well knows, friendship with the latter is the surest way of being on good terms with their patrons; much on the same principle on which care of the pence is said to insure the pounds taking care of themselves. The world declares him to be a good-hearted fellow. His heart may be good—in the sense that a picture, a statue, or a machine may be good—but it is equally artificial. He has made and fashioned it, out of a piece of raw material, into the design approved by good society. What more, he might fairly ask, could society require? Natural-heartedness is a luxury that he never allows himself. Education in the world's ways he considers as necessary for the heart as for the head, and his heart is educated to the highest standard of conventional virtue. He even visits the fatherless and the widow in their affliction—when they have twenty thousand a year; he stands by his friend when the world turns against him—if he is a duke or a marquess; and he lends money without expecting to be paid back again—when he thinks it is to his own interest so to do. He contributes to the pet charities of great ladies, knowing that the money thus cast, as it were, upon the waters shall return unto him, in some form or other, before many days; but he is too high-principled to assist the poor, as such a proceeding might have a tendency to pauperize. He worships one god, and his name is Society. Sometimes the Best Fellow in the World is a parson; but he does not find himself much hampered by his calling. Have not many members of the best families been "in the Church?" so why should he object? He is the model of "a nice clergyman." His very existence is a spiritual consolation to many miserable sinners. They argue that the Best Fellow is a good clergyman, and will therefore go to heaven. They themselves live in the same society and in much the same manner as the Best Fellow—therefore &c., Q.E.D. His sermons are severe, but at the same time comforting. He denounces drunkenness and the other vices of the poor, and this greatly edifies the rich. After scolding the lower orders, he lectures good society and gently deprecates its want of charity. His idea of want of charity quite meets its views. When a young man is fast, it is uncharitable to exclude him from our drawing-rooms. When a married man flirts with other people's wives, it is uncharitable to shun his society, and when it is reported that a certain lady is unfaithful to her husband, it is uncharitable to believe it. If the worst comes to the worst, he preaches the duty of forgiveness. He recommends the charitable to bear in mind the many and great temptations to which the rich are exposed. With them, too, dissipation is but the fulfilment of their duties, and they must live according to that position in life in which they find themselves placed. Children must not be treated with strictness, lest they should become deceitful, and they must be allowed plenty of gaiety when they are in the schoolroom, lest they should become over-frivolous from mere reaction when they grow up. Expenditure is much to be encouraged, as it is good for trade, and hunting or shooting six days a week prevents young men from doing many things which are worse. Such is the general drift of this excellent cleric's doctrine, both in the pulpit and in the drawing-room. He encourages good music and floral decorations when they please the wealthier portion of his congregation; but he carefully avoids extremes. When questioned as to his views, he complacently observes that, although there may be cases of extreme practices in either direction, he feels convinced that the main body of the clergy of the Church of England is "sound." His stories are excellent, being pungent, but never naughty, and he is quick at repartee without being severe.

Even as a younger son, the Best Fellow in the World manages to assert himself. As a boy he is of course on an equality with elder sons, and at school and college he makes friends with those who have been born with what nurses call silver spoons in their mouths. When grown up, he is too faithful to desert these friends of his childhood; and he will put himself to great inconvenience, and even go through the unpleasant process known as "swallowing dirt," in order to keep on good terms with them. In one sense he works hard for his bread. He has to be able to sit up all night, and then appear early at breakfast, full of fun and vigour. His head must never ache, and he must never have letters to write, unless he perceives that his presence is not required. At any moment he must be prepared to tell a good story, sing a comic song, or act in private theatricals, and he must be equally ready to listen patiently for days and nights together to the most confirmed of bores. At country houses he must revive the flagging spirits of the party whenever required, and he is expected to "get things up," and make them "go off well." In fact, he must be a sort of social Impresario. Unfortunately, too, he is generally obliged to acquire the art of borrowing money gracefully; and, when greatly harassed in his mind as to the ways and means of meeting a bill, he must be the life and soul of the party at some dull country house, and seem overflowing with joviality and merriment.

Most people must be acquainted with specimens of the Best Fellow in the World. We have only dwelt upon two or three varieties of the species. We leave people to estimate their worth by their own experience. To the great and the wealthy they prove useful and afford amusement, just as a good horse or a good gun might be useful or amusing; but to their poor or less known acquaintances they are of little service. "Scratch the Russian," said Napoleon, "and you will find the Tartar." Scratch the Best Fellow in the World, and you will generally find what the Americans call "a pretty considerable humbug."

THE POPE'S ENCYCLICAL.

THE recent Encyclical of Leo XIII. has for some reason not been thought worth a place in the *Times*, either in full or even in a brief summary, though it was unfavourably noticed in a not very appreciative leader. The Roman Correspondent of the *Standard*, who is usually well informed, is both more accurate in his account of it and more felicitous in his comments; and elsewhere also, alike in English and foreign journals, the true significance of this last Papal manifesto has been better understood. It is called in one of them "a very sensible sort of document," written in a "thoughtful style," though "rather conservative," as it no doubt is. A clerical correspondent of the same paper is more unreserved in his commendation, and declares the argument "throughout Scriptural and sound in the main," though he observes—without any note of censure however—that His Holiness "ignores the Latin errors and excesses which have called forth, by way of reaction, the hard secularism he deplores." In other words Leo XIII. does not take occasion in his last Encyclical to pronounce a public condemnation on the policy of his predecessor. It would have been rather strange, and not perhaps very prudent, if he had. The more important question is whether he is practically endorsing and carrying on that policy, or quietly substituting another in its place. And it is hardly necessary to read between the lines of the present document, to say nothing now of earlier utterances to the same effect, to be able to answer that question with tolerable confidence. There was a report in last Wednesday's *Times* of a meeting of the "League of St. Sebastian," a society founded for the restoration of the temporal power, which affords contributory evidence from an unexpected quarter in the same direction. It is true that Sir George Bowyer, who occupied the chair, began by congratulating the members on the improved prospects of the League; but they must have found, we fear, very cold comfort in the only proofs he ventured to suggest of this improvement. "They had not given up all hope that the temporal power *might* be restored in some form or other. . . . Events *might* happen in Europe which would lead to the restoration of the temporal power, and if restored in a moderate form (?) it would develop itself and become before long, all that they could wish." Does "a moderate form" mean the Leonine City, or a secular Parliament, or what? The speaker went on to remark that "it would be heresy, of course," to say that the temporal power was necessary; it was merely a means to an end. Another speaker urged the duty of subscribing to the "Peter's Pence" fund, which was established as a substitute for the Civil List. A third thought that with greater energy much might be done to promote the object in view. This is a very milk and water style of rhetoric compared to what used to be in vogue under the late pontificate. There is of course no limit to what "might happen" in Europe or any other part of the world. That the Leaguers are not very sanguine as to what will happen is a natural inference from the tone of their speeches, and there can be little doubt that so far they reflect the deliberate judgment of the reigning pontiff. A different style of oratory was adopted and encouraged by Pius IX.

But to return to the Encyclical. We have referred to its reception in some English journals. The Roman Correspondent of the *Guardian* speaks of its being received with admiration and approval, or with "querulous criticism" by the European press generally, and of the elevation of language and noble sentiments which characterize it. What is most remarkable is to observe the tone of the Italian and especially the Government organs. Thus the *Italia* contrasts the "useless regrets and impotent anathemas" of Pius IX. with Leo XIII.'s manner of resolutely facing and discussing the problems of modern society, and considers his treatment of Socialist doctrines as fully justified in the main by the principles of philosophy and social science; and the writer proceeds to remark on the import-

ance of finding the principle of obedience to the laws of the State so unequivocally laid down in an Encyclical. "We have been so long accustomed to hear the furious cries of the clerical demagogues that we turn with real gratitude to this calm, elevated, truly Christian language; and any reserves we may feel called on to make as to certain statements of the Encyclical disappear before the importance of an act destined to exercise a great influence in Europe." And Signor Tajani, Minister of Public Worship, has spoken in the same sense in the Senate of the "calm and elevated language of the Pope." The article goes on to speak of the Encyclical as tending to promote the formation of a new Catholic Conservative party according to the programme of Signor Sclopis and Signor Masino, and virtually bidding Catholics resume their part in the active life of the nation. This is of course not matter of unmixed satisfaction to Italian Liberals, who naturally think the Church will be far more powerful when it enters the field of battle than while it pursued a policy of sullen and unfruitful isolation. But in any case they regard the Encyclical as indicating a momentous change of front on the part of the Papacy, and therefore as "one of the greatest events of our time." Masino is a Liberal Catholic, who is prepared to organize a Catholic party in Italy on the basis of accepting existing facts. And there seems to be no doubt that he has the sympathy and approval of the Pope in his design. His Holiness has shown his vigour and consistency in smaller matters by a stern reform of the manifold internal abuses of the Vatican which only throve and multiplied under the easy rule of his predecessor. The tribe of idle and sufficiently mundane *monsignori* who swarm at Rome are reputed to be already feeling the force of his heavy hand. The Canons of St. Peter's have been ordered to pay 25,000 francs a year to the Peter's Pence fund; and the various traditional but senseless extravagances, not to say impositions, allowed formerly among the functionaries of the Curia have been curtailed.

The original text of the Encyclical is not before us, but the French version which appeared in the *Italia*, and has probably been the one most often copied or translated in journals of northern Europe, is said to be very inaccurate as compared with the Italian version. The *Tablet* gives in full but in very stilted English what we presume is a translation from the original, but does not give the Latin text. By all accounts the Latin style differs almost as widely as the substance of the document from the precedents of the last pontificate. The Encyclical is understood to have been entirely composed by the Pope himself and corrected by his own hand. It is also said to have been privately submitted to those whom it was especially desired to conciliate—in particular to the authorities at Berlin—before it was published, and to have gained their approval. There is indeed a report that it was intended to be first published abroad, but in consequence of the contents oozing out it was at once sent to the Roman newspapers. The Pope begins by reminding the faithful that in his first Encyclical he had called attention to "the deadly pestilence pervading the whole framework of society, and bringing it to the brink of ruin"; but this does not refer to the downfall of the temporal power, for he immediately adds that "the evils we then deplored have of late so rapidly increased that we are constrained to address you again, in the words of the Prophet, 'Cry aloud and spare not, lift up thy voice like a trumpet.'" This increasing pestilence is explained to be the sect of Socialists, Communists, or Nihilists, who are seeking to overthrow the foundations of civil society. And the rest of the Encyclical is accordingly occupied in drawing out the irreconcilable difference between Socialism and the teaching of the Gospel, both as regards political matters and "that domestic relation based on Christian marriage which is the foundation of all society and government." But the significance of the document lies quite as much in what it omits as in what it contains. There is not from beginning to end one word about the temporal power or the quarrel between the Holy See and Italy. It does not certainly follow from this that Leo XIII. does not look upon the deprivation of the temporal power as a misfortune to the Church, or the manner in which it was brought about as wrongful and unjust. Most likely he does so view the case, and it is only fair to remember that there are many, who are not Ultramontanes or even Roman Catholics, who would so far to a great extent agree with him. But whatever personal convictions he may cherish on these points, it is clear that he does not attach to them anything like the transcendent importance they occupied in the mind of his predecessor. In his view the loss of the temporal sovereignty, so to speak, stopped the way to all and any dealings with modern society, till it was repaired. Nothing can be more unlike the pessimist *Non possumus* of Pius IX., than the earnest exhortations of his successor to "the nations and princes exposed to the fury of the tempest" of Socialism, not to restore the temporal power, but "to hearken to the voice of the Church, reminding them that the principles of religion and government are so closely identified that whatever injures religion must needs affect the loyalty of the subject and the majesty of government." There follows, indeed, an exhortation "to restore the Church to that position of liberty in which she may best exercise her salutary influence for the benefit of human society"; but there can be no doubt that these words refer, mainly, if not exclusively, to the negociations still pending between the Holy See and the German Government, in which it appears to be generally allowed that the former has maintained throughout a dignified and conciliatory attitude.

The fact is, as we have before now had occasion to observe, that Leo XIII. regards the state of the world not simply from the standpoint of an ecclesiastic, but of a statesman—a Christian and Conservative statesman no doubt, but there he will find a large following among Protestants as well as among his own spiritual subjects. As the *Diritto* expresses it, "Leo XIII. understands that the interests of the Catholic Church are not bound up with the violent possession of a few square miles of territory, and he has not hesitated to place himself at the head of a European Conservative party, tracing out an explicit programme for the Italian Conservatives. Under this aspect," adds the *Diritto*, "the Encyclical creates a new and most grave situation, which imposes on the Liberal party new and important duties." It is obvious indeed, as we intimated just now, that to the extreme Radical and anti-Church party in Italy the attitude assumed by Leo XIII. is far more embarrassing than that of his predecessor. But it is equally obvious that no Pope, or rather no chief pastor of any Christian communion, could in reason or conscience accept such a programme as would meet their wishes. A Pope can hardly be blamed for desiring that the social and civil life of Christian nations—in which category it is clear from his language towards the German Emperor that he includes Protestant nations—should be regulated on Christian principles. That is quite another thing from insisting that the Church can never come to terms with them at all until they have restored to her chief pastor the civil sovereignty over an Italian State. That the organs of the Jesuit party are much puzzled to know how to deal with the utterances of the present Pontiff we can readily believe, and that he has all along had to contend with the most violent, though secret, opposition of that party, is generally understood. According to one report, indeed, claiming high authority, he credits the Jesuits with "a pious desire" to poison him, which is only held in check by their conviction that "his successor would pay his debts to them." The wonder under the circumstances is, not that he should fail to condemn more openly a policy he has abandoned, but that he should already have spoken so plainly as he has done. The difficulties of a reforming Pope are in any case sufficiently serious, and they are certainly not diminished when he happens to be the successor of Pius IX.

PRINCE BISMARCK ON SWELLS, SNOBS, AND COCKNEYS.

At Versailles on the evening of the 8th of December, 1870, Prince Bismarck consoled his impatience at the delay in the bombardment of Paris with a repast consisting, among other delicacies, of pancakes with mushrooms and pheasant with *Sauerkraut*, cooked, as the man of blood and iron loves it, in champagne. After uttering the sound observation that of Forster and Deidesheimer (wines, it is needless to say, of the Palatinate) the preference is to be given to the former, and the more questionable doctrine that *Sauerkraut*, when corrected by a little neat brandy, is far from being unwholesome, and discussing the case of a young diplomatist at Vienna who collected and bound in two elegant volumes all the bills of fare of the Ambassador under whom he served—among which, we are told, are some deeply interesting combinations—the Chancellor proceeded, by transitions not recorded in the valuable work of Herr Busch, to analyse the ideas (*Begriffe*) of Swell, Snob, and Cockney. Prince Bismarck knows England, if he does not love it, and the judgment of his acute and powerful mind upon us cannot fail to be interesting, even if it be at times not greatly flattering to our vanity.

A few words suffice for the Swell. The Prince began by characterizing a brother diplomatist as such. It is to be regretted that the name of the diplomatist in question is not recorded, since in such matters an example is of more value than a definition. "It is a capital word," said Prince Bismarck, "for which we have no equivalent in German." Then, correcting himself, he quoted the word *Stutzer*, or dandy, adding that the English word contains, over and above what is connoted by *Stutzer*, the notion of a prominent chest and of an air of lordly self-importance. Here, on the whole, Prince Bismarck must be admitted to have hit the mark. But the characteristics of a swell are obvious and external; those of the Snob, which the Chancellor went on to discuss, are much more recondite, manifold, and subtle. And here his analysis is less successful. "The snob," he says, "is something quite different from the swell; and, as in the case of the swell, there is no word which gives the idea in German. The word denotes various facts and qualities, but more especially one-sidedness, narrowness, the inability to escape from local or class prejudices, Philistinism. A snob is a kind of *Pfahlbürger*. But this is not exactly it. You must add the inability to rise out of the interests of one's family, a narrow horizon in judging of political matters, the being imprisoned in inbred ways and fancies. There are snobs of the feminine sex and of high social position. You may also speak of party snobs, of men who in great public affairs cannot escape from the trammels of private right—advanced Liberal snobs." Now it may be admitted that there are female snobs and advanced Liberal snobs; though politeness forbids one to give instances of the former, and discretion of the latter; but Prince Bismarck's description is not that of a snob at all, but it is an excellent description of the Philistine. For "snob" read "Philistine" in the foregoing account, and it is all right. It is the more curious that Prince Bismarck should have failed to seize the characteristics of the snob, because the animal, though not confined to England, flourishes here in a rank abundance which can hardly have escaped his notice. Both the outward and inward marks of the type—the

pushing vulgarity, the pretentious loudness, the underbred familiarity which belong to one sort of snob, as well as the qualities which characterize snobs of better birth—the social unscrupulousness, the coarseness of spirit that measures others by their worldly place, the want of inner dignity and self-respect that drives people to cling to those a peg or two above them on the ladder of society—must have been noticed by Prince Bismarck, as they are noticed constantly by other foreigners. The snob, indeed, is a natural growth in a society passing from an aristocratic into a democratic stage.

"A Cockney," then pursued the Prince, "is again something different. It is applied to Londoners in particular. There are people in London who have never come out from among their walls and lanes, their brick and mortar, who have never seen anything green, who know no other life than that of these lanes, and have always lived within hearing of Bow Bells. There are people at Berlin, too, who have never been outside of it. But Berlin is a little place by the side of London or even of Paris, where there are cockneys, too, but called by another name. In these great cities ways of looking at things are formed, which grow and spread and become fixed as prejudices in the minds of the inhabitants. In such great centres of population, where people have no experience and therefore no just conception, or no conception at all, of what lies outside, arise this narrowness and simplicity (*Einfaltigkeit*). Simplicity without conceit can be put up with. But for a man to be a simpleton, unpractical, and conceited into the bargain, is more than can be borne." This may be allowed to pass. But a little later on the Chancellor comes back again to the snob. "There are snobs," he says, "in the country. Take, for instance"—turning to Prince Putbus—"a good sportsman who is satisfied that he is the first man in the world, that sport is the only thing in the world of any consequence, and that people who don't understand sporting matters amount to nothing." It is quite plain from these examples that Prince Bismarck does not know what a snob is, or, if he does, that he knows him by the wrong name.

It is very seldom that the Chancellor has a good word to say about the English. When he has, it is to point out some Teutonic virtue which they possess to a less degree than the Germans. In drawing the hackneyed contrast—containing less than half a truth—between the superficial politeness of the French and the genuine politeness of heart which he claims for his own people, he finds occasion to throw in a little diluted commendation of the English character. Perhaps his experiences on landing one Sunday at Hull gave him a twist the wrong way. "The keeping of the Sunday," said the Prince, who is himself, for a German, a strict observer of the day, to his company—"what a horrible tyranny! I remember the first time I came to England landing at Hull and whistling in the street. An Englishman, whose acquaintance I had made on board, said to me, 'Pray, sir, don't whistle.' 'Why not?' said I; 'is it against the law?' 'No, sir,' said he; 'but it is the Sabbath.' This vexed me so that I went at once and took a ticket for another steamer which was going to Edinburgh, as it did not suit me to be hindered from whistling when I pleased. But before this happened we had been in an inn, and there I got hold for the first time of something good—toasted cheese—Welsh rabbit." One can almost hear the smack of the lips with which these words were accompanied. Elsewhere, after speaking in high terms of Lord Odo Russell, he went on to say:—"One thing only made me at first doubtful about him. I have always heard and found by my own experience that all Englishmen who talk French well are dubious sort of people (*bedenklich*), and he speaks French admirably. Still he can express himself well enough in German too." The Prince says little about English politics, home or foreign, but the little that he does say is characteristic. When the Russian Government declared its intention to disregard the part of the Treaty of Paris relating to the Black Sea, public opinion in England, as all remember, was greatly excited. A statement of Lord Granville's in the House of Lords that England could not for fear of future complications tolerate any one-sided solution of the question being telegraphed to the German Chancellor, he smiled, and said, "*Future* complications! Parliamentary orators! Don't believe a word of it! The accent is laid on the word 'future.' That's the way people talk when they don't mean to do anything." "The Russians," said the Prince another time, in speaking of the same matter, "ought not to have put forward their claim so modestly; they should have asked for more; and then they would have carried their point about the Black Sea without any trouble."

The toasted cheese deserved a better recompense than all this. It was an argument addressed to that part of the Chancellor's nature where his conversation shows him to be peculiarly sensitive. Nowhere, out of the *Almanach des Gourmets*, is so much to be read about eating and drinking as in these volumes of Herr Busch. The Prince's wit, audacity, piety, and cunning sink into insignificance when compared with the range and voracity of his truly princely appetite. On the day when he delivered himself of the above utterance on the Black Sea question, he was recovering from an attack of indisposition, and his meals would presumably be lighter than usual. But beer, champagne, turtle-soup, boar's-head, and a mess of mustard and raspberry-jelly ("which was very good," says Herr Busch) formed only a part, on that day, of his repast. He could at one time dispose of eleven hard-boiled eggs at a sitting. He is fond of middle-sized trout, weighing not over half a pound, but can eat *Maräne* all day long. Carp and sand eel, on the contrary, are not grateful to his palate. Besides his favourite drink of porter mixed with champagne, he strongly recommends another compound, said to be the invention of Field-Marshal Moltke, consisting of hot tea, sherry, and champagne. He enjoys good mutton, but is less addicted to filets of beef or to roast beef in general. He even suggests playfully that a plump child or a fresh young girl would be anything but bad eating; and once when an unpleasant onion-like smell greeted his olfactories as he was driving near the smoking village of Bazeilles, he pronounced it to be the odour of burnt Frenchman. His bill of fare of Friday, the 23rd of December, 1870, has fortunately been rescued from oblivion. We are told that it is only a sample of the rest. First came onion-soup with port wine; then a saddle of wild-boar together with beer; upon this, Irish stew, turkey, and chestnuts, all washed down with champagne and red wine at discretion; finally dessert, in which the quality of the pears is especially noted. "The German people," says the Prince, "are resolved to have a fat Chancellor." Hampers from Berlin conspired with the native produce of France to bring about this happy result. But though a great eater, the Chancellor cannot be called a delicate or a scientific diner. In this respect he is evidently surpassed by the young diplomatist mentioned above, whose arrival on our shores with his two precious volumes will mark an epoch in the development of gastronomy in this country.

M. SARCEY'S CRITICISMS.

M. SARCEY has continued the series of notices concerning the members of the Comédie Française which we have from time to time criticized in these columns, and which in view of the approaching visit of the Comédie to the Gaiety Theatre have acquired a special interest. M. Sarcey is supposed by many French people, and perhaps not least by M. Sarcey himself, to be the greatest critic of the day; and as it is a common belief or superstition that in all matters of taste the French nation is far ahead of our own, it might seem not a little curious that his work should be disfigured by those grave sins against good taste which we have often commented on, and of which one of his latest issues of *Comédiens et Comédiennes* contains an almost unusually glaring example. The truth is, however, that in the matter of their amusements the Parisians are not unlike spoilt and somewhat heartless children, and that the brutality with which M. Sarcey has often spoken of the unavoidable failings of players whose names ought at least to command a decent respect is not peculiar to him, but is characteristic of the class to which he belongs. We in England are perhaps too apt to err in the opposite direction, and to be too chary of saying anything that can hurt the feelings of a person who has long worked successfully to amuse us, and who does not accurately hit the right time for leaving off a pursuit which has become laborious to both parties interested in it. An excess of indulgence, however, is far to be preferred to such offensive fault-finding as M. Sarcey chose to apply to M. Bressant during his last appearances on the scene of his well-won successes. No English critic, it may be hoped, would dream of dwelling contemptuously on the ravages made by illness in a favourite actor's appearance. But it is not only of the living that M. Sarcey speaks in this manner. In the last number but one of his first series of *Comédiens et Comédiennes* he has or makes occasion to refer to Mlle. Emilie Dubois, an actress whom frequenters of the Français will remember as a successful *ingénue*, and he does it in this way:—"Pour Emilie Dubois! She disappeared at the right moment for her fame! Already one could just perceive beneath the brightness of her skin, tightened by cold cream, the network of those little wrinkles that the contraction of a perpetual smile silently marks around the mouth and eyes of the theatrical *ingénue*, the perpetual *ingénue*." Nothing passing under the name of criticism could well be more offensive to English ideas than this, and it is pleasant to turn from it to M. Sarcey's account of M. Mounet-Sully, which has much interest.

At the end of the war of 1870 M. Perrin, who had been appointed Director of the Comédie Française, was on the look-out for some new blood to infuse into his troop. He felt that the public taste was coming round to the classical tragedy, and he wanted some new actor to play such parts as Hippolytus and Orestes. He asked all his actors to help him, and M. Bressant responded to his appeal by saying that he remembered having had in his class a strange fellow, whom his comrades had nick-named "*Midi à quatorze heures*, parce qu'en effet il était possédé de je ne sais quel goût du singulier qui allait jusqu'à l'extravagance. Il a obtenu dans le temps un prix de tragédie. Il y avait quelque chose dans cette cervelle à l'envers; c'était un tempérament d'artiste." M. Bressant had lost sight of his pupil, but after some little time he was found in a state of wretchedness and despair, debating with himself whether he had not better throw up the theatrical profession altogether. In his early youth he had felt an irresistible vocation for the stage, and had with some difficulty obtained his parents' permission to gain his entrance at the Conservatoire. There he studied for two years, won a prize for tragedy, and was engaged in 1868 at the Odéon, where he played various parts without attracting any attention, and, as has been said, he had come to doubt if he would ever make his way when his old master came to take him to M. Perrin. He recited some verses before the committee of the theatre, was at once engaged, and made his appearance as Orestes in July 1872. His first entrance commanded the admiration and

attention of the audience; he had given a new stamp to the part, in which he looked, says M. Sarcey, like one of "ces Arabes ardents et farouches que Regnault se plaisait à nous peindre. C'était une manière nouvelle de comprendre le rôle et de rendre le personnage." It was not, however, till the third act that he completed this impression. Then he spoke the lines,

> Tout lui rirait, Pylade, et moi, pour mon partage,
> Je n'emporterais donc qu'une inutile rage!
> J'irais loin d'elle encor tâcher de l'oublier!
> Non, non, à mes tourments je veux l'associer,

with such depth of feeling that the audience, which is not apt to be too demonstrative at the Français, gave him three rounds of applause. Then, says the writer, occurred a thing which he had never before witnessed:—"Acteur et public s'emballèrent de compagnie et prirent le mors aux dents." He was entirely carried away by the passion of the part, and carried the public away with him, so that not one of his faults was noticed, and the next day nothing but Mounet-Sully was talked of on the Boulevards. M. Sarcey, however, who, whether his powers are sometimes overrated or not, is undoubtedly a fine critic, had already noted the faults to which we have often directed attention. "For my part," he wrote, "I believe he has a fine future before him; but let him beware of people who urge him to those bursts to which he is but too prone. He will always have plenty of vehemence and fire; what he wants is correctness and repose. Now everything is permitted to him because he is sowing his wild oats. Later on," continued M. Sarcey with some *naïveté*, "we shall be severe in proportion to the great hopes he has given us."

The prophecy was justified on the actor's second appearance in *Le Cid*, when he reproduced more or less the sombre and fatal air which had been successful in Orestes, missing altogether the bright and chivalrous side of the part, and refusing, as he always has done, to listen to advice or criticism. Upon this M. Sarcey makes a remark which is very well worth attention. What is one to do, he asks, with a player who to every observation replies with obstinate courtesy, "I feel the part like that"? "Eh! misérable! Il ne s'agit pas de le sentir, mais de le comprendre!" Here in a few words is the essence of the theory of acting which Diderot developed at length in his brilliant dialogue, a theory as to the truth of which we entertain no doubt. A player who trusts to inspiration, who relies mainly upon his feelings, may arrive at splendid bursts of passion, but they will only be appropriate when his part fits his own nature, and even so his fire may any night burn low and leave him tame and ineffective. The experience of great actors has proved, over and over again, that study is the first thing needful to success. The player must think out his part, forgetting his own temper and inclinations, and form a consistent theory of how the person created by the author would look, move, and speak under the circumstances presented. He must know accurately what tone, what gesture, and what expression he means to employ at each point to carry out this theory, as much for his own sake as for that of his companions on the stage. When all this has become, so to speak, crystallized in his mind, he may without danger lose himself in his part to a certain extent. The prearranged business will after a time become a kind of reflex action of mind and body, and if any sudden inspiration occurs to him, there will be no danger of its disturbing the harmony of the whole performance. Such sudden ideas, and even mere accidents of the moment, have often been highly successful in the case of actors who rely upon study; and such actors have always carefully noted and repeated the effect thus unexpectedly produced. Under the deplorable system of long runs which prevails in London one may, by witnessing several times the performance of a distinguished actor in an important part, get some practical proof of the value of Diderot's and M. Sarcey's theory. On different nights the actor will be more or less powerful in certain passages, according to his mood or his bodily condition. He may be, as it were, inspired in a burst of passion or tenderness to an unusual extent; or he may, feeling fatigued, tend to extravagance in the effort to whip up his sinking spirits; but he will never sink below a certain level of excellence in the general meaning and expression of the performance. It is M. Mounet-Sully's misfortune to disagree with Diderot in practice, if not in theory, and to trust so much to the inspiration of the moment that he has, we believe, frequently upset the arranged business of the stage and amazed his fellow-actors by assuming at the performance of a play positions entirely different from those which he has taken at rehearsal. Of his peculiarities M. Sarcey gives more than one striking instance. With reference to M. Augier's *Jean de Thommeray*, and the criticisms offered to M. Mounet-Sully before his appearance as the hero of that piece, he writes:—"Ce qu'il y a de plus étrange, c'est que Mounet-Sully souffre tout le premier de cette impuissance à profiter des conseils, qui semble être chez lui une maladie congénitale. Il se prend la tête dans les mains, il tombe dans de profonds désespoirs qui vont jusqu'aux larmes; mais quoi! ce n'est pas sa faute; il a une case du cerveau bouchée, à moins que ce ne soit un malin farfadet qui se joue de ses bons vouloirs et qui se plaise à les déconcerter." This, though it is put in a way for which we have no liking, is no doubt true. Again, speaking of *Hernani*, M. Sarcey draws a comparison between the methods adopted by M. Mounet-Sully and M. Worms at rehearsals. While the one made steady progress with his part, adding touches here and there to it every day, the other took a new point of departure at each rehearsal. If he had spoken some line particularly well on one day, he was sure on the next to give it in an entirely different and probably less successful manner. The performance of this actor, to which the French critic gives the greatest praise (which he supports, according to his custom, by quotation from his own writing), is that of Orosmane in *Zaïre*. We should venture to differ from M. Sarcey on this point, but that M. Mounet-Sully is quite capable of interpreting the same part on different occasions in entirely different ways. It is not very long since we gave some account of his performance in *Hernani*, and in June London playgoers will have an opportunity of forming their own judgment upon it. M. Sarcey's remark upon it is that it leaves critics in doubt whether he is an erratic genius or an "irrémédiable toqué, avec des éclairs de génie."

Together with M. Mounet-Sully, M. Sarcey considers M. Laroche, who, he justly says, has precisely the faults and the merits which M. Mounet-Sully has not. First-rate in secondary characters, he has not yet made his mark in any great part. His admirable performance of Ragenhardt in *La Fille de Roland* is selected for special praise by M. Sarcey, who observes that the enrolment of M. Worms among the sociétaires of the Comédie is likely to diminish M. Laroche's chance of playing any parts but such as those in which hitherto he has been "tout à fait supérieur," and which are, especially at such a theatre as the Français, really as important as the more brilliant characters. But he adds, and in this we quite agree with him, that M. Laroche may very likely find some day a part of the first order which will exactly suit him, and the performance of which will add to his already enviable reputation.

M. Worms, whose return to the Français has deprived M. Laroche of certain chances which but for that would have fallen to him, was engaged at the Comédie in 1858, but left it in 1864 to take a profitable engagement at St. Petersburg, in consequence of being very badly treated by the Minister of the day, who had his own reasons for refusing to appoint M. Worms a sociétaire. He remained in Russia for ten years, and then made his reappearance in Paris at the Gymnase as Armand Duval in the sickly and tedious *Dame aux Camélias*. M. Sarcey says that the part was not suited to him, and we can easily believe it. His performance in it was certainly far from being first-rate, and yet he is undoubtedly an actor of first-rate talent. But it is difficult to imagine any actor or actress making a mark in so idle and repulsive a piece as the *Dame aux Camélias*. Since M. Worms's return to the Français, which took place two years ago, he has had uninterrupted success. In *Le Marquis de Villemer* he divided the honours with M. Delaunay, and as Don Carlos in *Hernani* he has succeeded in the difficult task of replacing M. Bressant. His delivery of the famous monologue is said by competent judges to be of the most masterly order. During many performances of *Hernani*, when M. Worms was ill, the part was filled by M. Laroche, who seemed to us to interpret it with rare skill and science; but we look forward to comparing his performance with that of M. Worms when the Comédie comes to London.

CO-OPERATIVE DRESS STORES.

We do not know that the present generation of retail tradesmen are offenders beyond all that have gone before them, but certainly they have fallen upon troublous times. The shrewdest of them could scarcely have read the signs of the coming storm when the little cloud no bigger than a man's hand loomed upon the horizon in the shape of the first Co-operative Store. Nor probably had the Civil Servants who started that enterprise in the hope of eking out too narrow incomes any notion of the revolution they were about to originate. The beginnings of the Store system were modest and unpretending enough. A meagre assortment of mixed goods was laid out in a set of upper chambers in a side street, which were furnished with the strictest regard to economy. The customers might be gratified with unfamiliar bargains, but otherwise they had considerable cause for complaint. If their shopping was cheap, it was decidedly uncomfortable. The overworked victims behind the counters showed unmistakable dislike and contempt; and a civil word or a smile was a thing to be positively thankful for. Gradually, however, matters began to mend; and the hard times and prolonged commercial depression undoubtedly gave a strong impulse to a movement which could hardly have failed to succeed in any case. We can imagine the feelings of the old-fashioned shopkeeper who saw himself gradually deserted by the friendly patrons in whom he had come to believe that he had a vested interest. Long-standing accounts were closed, and orders from extravagant households fell off in a deplorable manner. Those who remained faithful to him among the faithless were chiefly the improvident and impecunious who took unlimited credit, and against whom he had been in the habit of guaranteeing himself by taxing more punctual paymasters. It must have been shocking to him to gaze on the files of carriages drawn up during the fashionable shopping hours before the portals of the mushroom miscellaneous establishments. The shopping at the Stores was becoming tolerably easy to those who set little value on their time. The salesman and saleswoman had been drilled into something like affability; and, though it was undoubtedly a drawback having to make out one's own bills, to present them for verification, and to tender payment through a wicket, yet there could be no mistake about the pecuniary saving. It was not only that one got satisfactory articles at a most moderate advance upon the wholesale cost,

but the habit of paying ready money encouraged the practice of frugality. There may be generous-minded and self-sacrificing persons who feel a benevolent sympathy with the unlucky retail dealers; and there are people whose time is precious, or who are absolutely indifferent to their expenditure, who cannot endure the slightest inconvenience or delay; but it is certain that the custom of the Stores is extending with extraordinary rapidity. As the question of this competition is a very vital one with many anxious citizens whose incomes are ominously shrinking till they threaten to shrivel up altogether, it is freely ventilated in the columns of the *Daily Telegraph*. What chiefly strikes us in the very miscellaneous correspondence which fills the pages of our contemporary is the fond and absurd delusions to which so many of the retailers cling. We recognize a certain force in the argument that an expert who has been born and bred in his calling has many advantages as regards the quality of his goods, though sufficient salaries are pretty certain to provide capable managers and buyers. It is incontrovertible, as we have remarked already, that it is more agreeable to give your orders without a system of checks, and to have your purchases promptly delivered at your door. But it is idle to hope that a man who has but a few thousands to turn over, and who has to keep himself and a houseful of children on the proceeds, can possibly compete both in cheapness and quality with a Company whose means are practically unlimited, and which gets enormous reductions from importers and wholesale houses by giving extensive orders. And we fear that hope tells a flattering tale when it predicts the day of an inevitable reaction when experience will triumph over presumptuous ignorance, and the public will come back to their senses and the tradesmen. The building of sumptuous new establishments with pillars and cornices of polished granite does not look by any means like approaching insolvency, more especially when this calculated outlay is confirmed by flourishing balance-sheets.

We can hardly say that the movement is merely in its infancy; but it is safe, at all events, to predict that it is far indeed from maturity. Tradesmen in all departments may lay their account with this, and they will do well to take their measures accordingly. Hitherto the grocers have been loudest in their complaints, and with most immediate reason. A pound of tea or of sugar carries no trade-brand upon it; should it meet your approval you may send it to your friends, and they will never inquire the name of your grocer; while in buying such proprietary articles as pickles and sauces you obtain a reduction of thirty or forty per cent. at the Stores, with the manufacturers' labels thrown in. With clocks and guns and coats and jewelry it is another matter. Those who turn out these articles must be more or less of artists, and even when fashionable makers charge exorbitantly for a name, there are many people who think they have value for the money. Many a man with more cash or credit than self-reliance would be ashamed to show himself at a battue with a weapon which had not been bought somewhere in Bond Street or St. James's; and in giving a present of jewels it is half the battle to show the imprint of some famous West-End firm on the casket. But even the great gunmakers and goldsmiths must begin to find that this is a world of wild innovation, and that radicalism is getting rampant in the highest circles. When peers of strong common sense and frugal minds come to pride themselves on the good shooting and general excellence of plain and cheap country-made pieces; when peeresses and ladies of indisputable authority have learned that there are simple working jewellers whose taste may be safely trusted, should one be fortunate enough to light upon them—then people of less pretension, and even the lavish and vulgar *nouveaux riches*, may be trusted sooner or later to follow suit. The butchers, too, have assuredly reason to tremble, and still more those overbearing autocrats, the fishmongers, whose monopoly makes them almost as detested as the farmers-general of old France. But, if there was one set of tradesfolk whom we should have believed to be comparatively safe, it was the fashionable tailors, and still more the fashionable milliners. Poor people must get their clothes as they can, and be thankful if they can anyhow make a decent appearance by London light. Most men past middle age get fairly philosophical in this matter, and when they marry or lose the personal advantages on which they prided themselves, they cease to be fastidious about the cut of their garments. Women who are oppressed beneath the burden of their household bills, or who have to do the best they can on a grudgingly given allowance, must, we presume, find milliners' charges almost prohibitory, and do their dressmaking at home by themselves or their servants. But every one knows that, if you aspire to take a place in society, you must pay studious attention to costume, and have your purse perpetually in your hand. It is not merely that your personal appearance must be irreproachable; that your coat must sit to the figure with the easy suppleness of a kid glove, and your pantaloons fall in waving beauty lines on boots that mask or embellish the deficiencies of the feet. But you must be prepared on occasion to give the name of your tailor, and to launch out in a critical and comparative discussion of his capabilities. It is understood that there is nothing impertinent in a question on this interesting subject; it should even be received as a delicate compliment, though sometimes you may suspect a sarcasm. And if a man deals with one of the cheap advertising tailors, or, on the other hand, at an establishment which is disreputably nameless, he is forced into a disagreeable dilemma. He must either tell a bare-faced lie or betray himself by losing his presence of mind; or else, if he avows the simple truth, he must be prepared to see his companions shrink from him. It takes some nerve for a promising aspirant in fashionable society when sitting in a smoking-room towards the small hours, even although men are most disposed at those times to be genially large-minded, to make a bold avowal of this kind. As for the ladies, they have even less choice in the matter. If they attempt to do justice to their attractions or to hold their own with their rivals, they must be lavish to recklessness in the way of expenditure and must frequent none but establishments of the loftiest pretensions. Unless they have an unimpeachable position to fall back upon, and are careless of considerations of personal vanity, they must place themselves in the hands of some eminent artist, and leave all thought of the bill to their husbands or fathers. The material of their dresses may be inexpensive enough; fashion occasionally plays strange pranks in that respect. But the maker manages to redress the balance in her own favour when it comes to the question of trimmings; and, at all events, the talent of dazzling by simplicity is doubly entitled to the remuneration it demands.

So the ordinary Co-operative Store could have no chance in competing for this high-soaring sort of custom, and the Wörths of Paris and their brethren in London must hitherto have felt themselves tolerably secure. Theirs was a grand profession, in every sense of the term. They smoothed the way to social successes which might lead to splendid triumphs, matrimonial or political; and, knowing their own value better than anybody else, their charges were only limited by their consciences. Moreover, thanks to the quick changes of fashion, their orders were multiplied indefinitely. The brocades and velvets which used to be handed down as heirlooms, and which still survive in family wardrobes to be dragged forth and dusted for Christmas charades, had become relics of a primitive and prehistoric age. The more striking and conspicuous was a costume, the briefer was its existence, so far at least as the original wearer was concerned; and American belles, when preparing for a campaign in New York or Saratoga, laid in the most costly dresses by the gross, just as cadets sailing for India round the Cape used to buy their linen for the voyage. No wonder that fabulous fortunes were amassed. Yet it would almost seem that if some daring speculator, confident in his own talents, had just bought the goodwill of one of these brilliant businesses, he might possibly have good reason to repent it. Rivals are coming into the field who may perhaps run those monopolists hard. In the advertising columns of the papers we find a couple of prospectuses which must have sent a chill to the hearts of many prosperous and fashionable traders on the vanity of man and womankind. One prospectus advertises the Millinery and Dress Association, Limited; another sets forth the pretensions of the Gentleman's Dress and General Outfitting Association, Limited. We can hardly suppose that this simultaneous appearance is a bare coincidence, though the two concerns have distinct Boards of Directors and different officers. But whether the movement be concerted or not, they appear to be going to work most astutely and judiciously to cut the ground from under the feet of their predecessors. In the first place, they address themselves to those frugal instincts which are likely perhaps to be most strongly predominant in the spendthrifts who have been running deepest into embarrassment and debt. Of course, however, this economical line would be simply suicidal were the Companies promoted by Messrs. Brown, Jones, and Robinson, or the prospectuses dated from the purlieus of the Stock Exchange. But the Associations have established their temporary headquarters in fashionable West-end thoroughfares. The Millinery Association is launched under the auspices of a long list of aristocratic lady patronesses, and on the Boards of each Company we recognize more than one well-known name which should be a voucher for the consideration of the very best society. It seems a grand chance for the public, and, with fairly good management, one does not see why the experiment should not have a triumphant success. Place to the ladies in the first instance. The start of their Association ought to be assured. For if the patronesses give it their own patronage, and make a whip among their numerous friends and connexions, any ordinary working staff will have its hands full from the first, and there may more probably be some hitch in the execution of the orders. No one need be ashamed to mention the name of her dressmaker when she finds herself in such eminently good company. It is possible even that the Association may become the rage among wealthy strugglers for admission into society; since, by being profusely generous of their custom, they may lay illustrious ladies under personal obligations. After the first start, all will depend upon the style of the execution; but that need only be a question of money. For if funds flow in freely, first-class talent may be as freely engaged. The Association may make liberal profits and still find an ample margin to retrench upon. So with the Gentleman's Outfitting Company. And this not only offers to supply you with clothes, but to provide everything that man can possibly need in the way of outfit for the drawing-room or the moors, India, the colonies, or the hunting-field. You may buy a bell-tent or a tooth-brush, a dressing-case, a pair of rifles, or a box of cigars. Should the Association execute orders according to promise, it will soon be the "correct thing" to drop in there; and, by way of securing the patronage of idle men who may be trusted to make purchases when they are listless and tempted, it offers them a commodious suite of rooms for writing,

smoking, lounging, and beautifying themselves. It seems to us that these Companies are at any rate being brought out with a creditable preliminary expenditure of worldly wisdom, and, considering the growing tendency to co-operation, there is no visible reason why they should not be financial successes.

THE FALL IN PRICES.

AT the meeting of the Statistical Society on Tuesday evening, Mr. Giffen read a paper on the recent fall of prices which was characterized by the breadth of view and depth of research that mark all his productions, and brings out very strikingly the greatness of the depression of the markets. The first point to which he addressed himself was to give precision to the vague popular impression on the subject, by determining as nearly as may be the extent of the fall. For this purpose he made use of four distinct sets of statistics prepared by three different inquirers. The first set was collected by Mr. Giffen himself. In 1874, when the reaction from the preceding inflation first showed itself, he began a series of articles on the movement of prices, which he continued for several years, and as a basis for them he kept a record of the prices of certain leading wholesale commodities, representative of the general trade of the country. From the tables thus compiled it appears that the fall between January 1873 and the present time ranges from 10 to 66 per cent., and with three exceptions the variation is as much as from 26 to 66 per cent. The second set of statistics is by the author of the "Commercial History and Review" published annually by the *Economist*. From this the average fall appears to be about 21 per cent. The third set was drawn up by Mr. Arthur Ellis, and published as a supplement to the *Statist* in June last. It stops short at the end of the first quarter of last year; but, so far as raw materials are concerned, it shows even then a decline of about 21 per cent., which has since proceeded much further. "Foods" were then dear, whereas there has since been established an extraordinary cheapness. The last set is again by Mr. Giffen himself, having been prepared for the Board of Trade. It deals only with the exports, and is brought down no later than 1877, but it confirms the general purport of the foregoing. The net result of the whole is that the fall in the past six years has been quite as great as the popular language implies; that, on the average, it has not been less than 21 per cent.; that when allowance is made for the principle upon which the *Economist* table is drawn up, and comparison is instituted with the three other sets of figures, we have reason for concluding that the percentage is still higher, but that in any case the fall amounts to between a fifth and a fourth of the prices of January 1873. In other words, where a manufacturer obtained six years ago a pound for his goods, he now gets between fifteen and sixteen shillings. It must not be hastily inferred that this depreciation of four or five shillings in the pound is all pure loss to the producer. When he produces at a higher cost, and has to sell in a declining market, there is no question that he is a loser; and hence times of sinking prices are generally times of widespread embarrassment and numerous bankruptcies. But the present fall is not confined to any one class of commodities; it is universal, including wages. A decrease in the cost of production, therefore, accompanies the decrease in price. Besides, the sudden awakening of the manufacturer to the fact that he is not so rich as he thought himself leads him to discover and enforce a variety of economies which not seldom more than make up for the diminution in price. Continuous cheapening of commodities, then, is not necessarily disadvantageous to the producer, and may even result in benefit to him. To the consumer, of course, it is an unmixed good.

Having determined approximately the extent of the fall, the next question to decide is whether it is greater than in previous and recent times of depression. The point is of importance, since, if resolved in the affirmative, it tends to show that there is a permanent cause at work; and an affirmative answer is suggested by Mr. Giffen's and Mr. Ellis's tables, though a negative by that of the "Commercial History and Review." The latter shows that the range of prices was higher in 1865 than in 1873, and that the drop after the Overend failure was greater than at present; but that the level of price now reached is lower than that of ten years ago, and, in fact, nearer the range of prices that prevailed immediately before the gold discoveries in California and Australia than that of any intermediate period. On this latter point there is no doubt, but on the conflict as to whether the fall is more extreme, it is perhaps possible to reconcile all the authorities. As Mr. Giffen pointed out, the *Economist* table does not include the metals, and gives unusual weight to the textile trades. But in consequence of the American Civil War cotton ruled exceptionally high in 1865. The average of prices in that year is therefore made to appear much above what it would be if the metals were taken into account, and as a consequence the succeeding depression is probably exaggerated. However this may be, the fact at any rate is indisputable, that the present fall is very great, and that the level of prices now reached is nearer that of 1848–50 than has been known at any former time during the interval. This conclusion has a bearing on the gold question to which we shall by and by refer.

What are the causes of this state of things? Mr. Giffen enumerates four. The list might have been extended, but the object of his paper was not to trace all the circumstances which have combined to bring about the prevailing depression. It had a narrower and more limited purpose; and under the first head Mr. Giffen doubtless intended to group together all the causes which contributed to the crisis of 1873. Following his example, we may say that in the period of inflated trade a point was reached at which the supply of commodities outstripped the demand, and a decline of prices was the necessary consequence. Persons who were deeply committed had to realize at any cost, and their forced sales depressed the market still more. The alarm grew, and men endeavoured to recoup themselves for losses in some directions by selling in markets where the downward movement had not set in. This action extended the fall until it became general. The failures of 1875 aggravated the situation. The repudiations by foreign Governments diminished very greatly the incomes—that is, the purchasing power—of the middle classes. And the crisis of the past year gave a new impetus to the depreciation. Thus discredit and over-production stand foremost among the causes of the fall. Next to these is to be ranked the influence of three successive bad harvests. In the discussion which followed the reading of the paper doubt was expressed as to the correctness of this statement, or, at all events, as to the importance of the influence exercised by bad harvests at home. It was said that the home food supply does not amount to half the consumption; that a ten per cent. deficiency of the harvests at home, which is Mr. Caird's calculation of the deficiency of the three years 1875–6–7, is only five per cent. of the consumption, and therefore has little practical consequence. But this objection misses Mr. Giffen's real contention, which is that the embarrassment of the greatest of British industries—which agriculture unquestionably still is—continued for three years, exercises a prejudicial effect upon the whole trade of the country. A loss of ten per cent. must make away with the whole profits of the business, and the agriculturist therefore is driven to curtail his expenditure of every kind. His wife and daughters cannot have as many silk dresses or bonnets as usual. His sons, also, are kept short of money; and he himself puts off till more prosperous times outlay which he knows to be desirable but cannot afford. Thus the demand of the rural districts for the goods produced in the towns declines, and prices necessarily fall. Under Free-trade we do not suffer as we once did from scarce bread; but even now good or bad harvests occasionally make a considerable difference to the consumer. The blockade of the Russian ports, coinciding with a bad yield at home, made wheat dear two years ago. And, if there happened to be a short harvest in America, a deficiency at home would be a serious matter.

The third cause enumerated by Mr. Giffen is the gold scarcity caused by the demand for the metal by Germany and the Scandinavian countries for coinage purposes, and by the United States for resumption. We have recently discussed this subject, and have little to add to what we then said. The point of view from which Mr. Giffen considered the matter is, however, somewhat different from that which we took in the article referred to, and deserves to be carefully discriminated. Apart altogether from the question of a permanent appreciation of gold, it is plain that the metal may be made temporarily scarce and dear by exceptional and temporary demands, and this temporary scarcity may for a while depress prices. We quite agree with Mr. Giffen that the coinage operations in Germany and the Scandinavian kingdoms, and the American preparations for resumption, have had this effect. As we stated recently, the annual yield of gold is now under 20,000,000*l.*, while Germany has coined within the last eight years over 80,000,000*l.* The exact amount of recoinage is disputed. Some have put it as high as 30,000,000*l.*, and others as low as half that sum. Let us say that the new gold used up was 60,000,000*l.* The United States have taken over 30,000,000*l.* And Denmark, Sweden, Norway, and Holland have also taken a certain quantity. Mr. Giffen estimates the whole amount withdrawn somewhat higher than we lately did, or at 120,000,000*l.*, being at the rate of 15,000,000*l.* annually for eight years. A million per annum one way or other does not, however, affect the argument. The conclusion is irresistible that the extraordinary demand for gold of late has not left enough for current exigences, and that the scarcity thus created has helped to lower prices.

So far we have been dealing only with temporary and passing causes of a temporary and passing phenomenon. But Mr. Giffen intimates an opinion—or rather, perhaps, we ought to say an impression, for he shows the diffidence to be expected from so careful an investigator—that there is also going on a permanent fall of prices due to a permanent appreciation of gold. As we lately explained, the gold production of the world has fallen from nearly 30 millions to under 20 millions per annum, and at the same time the consumption has permanently increased. Germany, the United States, the Scandinavian kingdoms, and France are now gold-using countries. That is to say, besides their exceptional accumulation spoken of above, they have to keep up large gold currencies. The population and wealth of the old gold-using countries have likewise vastly increased, while their trade has augmented in a still greater ratio; and consequently they need a larger metallic circulation. There being thus a falling supply together with a greatly enhanced demand, the inference seems inevitable that the article in question must become scarce. It was objected during the discussion which followed the reading of the paper that various economies of the metal have been of late introduced or extended, but the assertion was contested by Mr. Giffen. The point thus raised is the most obscure and difficult of the whole controversy, and we are not aware of any data by which it can be settled. In the meantime it is perfectly certain that, if the gold

production continues to decrease, there must be a permanent fall of prices, unless means are found of further economizing the use of the metal. But, while this is clear, we are by no means satisfied that the scarcity of gold has yet reached the point at which, apart from the exceptional action of Germany and the United States, it would affect prices. The point is, however, hardly worth discussing when it has to be added that, unless new mines are discovered, or new means of largely economizing the metal are devised, the effect must very soon be experienced. This, strictly speaking, is all that Mr. Giffen positively asserts, and we do not see how any economist can dispute the position.

A STUPID SPORT.

FEW things are more irritating than to see other people rejoicing in what we feel to be a bore. Thus the very numerous satirical writers who have no taste for art, who think sculpture low, and unconsciously agree with Dr. Johnson in their inability to see any meaning in a picture, are always violent in their attacks on *dilettanti*. Persons who have a sense which their critic does not possess annoy him in a variety of ways. He thinks they pretend to be "superior"; he thinks that because they are not even as he is they must be affected. We confess that we are, for the moment, in the position of the censor of modern society who has no taste for some forms of enjoyment. We do not see the fun of "long-distance walking." Now long-distance walking, as the *Times* says, "has become very popular in this country." Persons who do not like it cannot but feel that they are outsiders. They hear of the performances of Mr. O'Leary and Mr. Weston, and the narrative leaves them cold. They are like the man who has no sense of colour, and who is asked to admire Titian, or Turner, or the works of Mr. Albert Moore. They have not even his naïve consolation in the face of artistic enthusiasm. He can say and believe that his tormentors are effeminate humbugs. He knows he has the sturdy sense of the middle classes with him; he is strong in the sympathy of the multitudes of men, women, and children who like chromo-lithographs of sacred subjects. But the man who cannot for the life of him see the sport of watching an Irishman stagger round the Agricultural Hall, day and night, for a week at a time, has no such comfort. He cannot say, even to his own heart, that the sporting gents who read eagerly about the dreary exercises of O'Leary and Weston are affected. He knows in his conscience that they have a sense which all the world does not possess; they can extract enjoyment from a spectacle which is either dreary or distressing.

Long-distance walking was imported from the United States of America, where it seems to have come into existence about the time when negro slavery was abolished. Perhaps in viewing the agonies of a half-dead man staggering along a track to the music of a band, and much to the anxiety of a doctor, the public found some compensation for the loss of the privilege of thrashing its own nigger. Or, again, as prize-fighting decayed, long-distance walking may naturally have taken its place. Two men who have walked four hundred miles in a week are almost as agreeable to look upon as two men who have been pounding each other's faces for three hours with their fists. In the latter case, to be sure, there is the fierce delight of battle, which every one can enjoy if he hardens his heart. Long walking, on the other hand, is scarcely more diverting than the slower tortures of the Inquisition, which only began to afford the spectator entertainment after the victim had suffered for some considerable time. As long as a long-distance walker is tolerably fresh, and going within himself, there is little excitement in watching him. It is about the fifth day that sleeplessness and fatigue tell on him, and the sport begins. He limps along, suffering torments from a festering heel. His brain is bemused with exceeding toil; and, as he staggers mechanically round, it is said that curious visions beguile him. He does not see the crowd, which stares, smokes, and drinks. He does not hear the music, which mixes in a dream of his past life. He thinks that he is working in some country place that he knew long ago before he was a long-distance walker, and a mirage floats before him, like that which cheats wanderers in the desert. When his hour is up, he staggers into his bedroom, and there, let us hope, has the good fortune to become quite senseless and indifferent. As the last day of the competition approaches the softer-hearted lookers-on wish to have some of the walkers removed; but their backers will not permit this. Men are compelled to subject themselves to this voluntary torture, which equals those to which Red Indian braves expose themselves.

The Americans have contrived to add a new interest to long-distance walking by encouraging women to appear on the track. A Madame Anderson has for some time been pleasing the public of New York by exhibiting the double prowess of the old athletes. Milo, as we know, could not only knock down an ox with his fist, but eat it after he had knocked it down. Ægon, too, the boxer in Theocritus, devoured eighty cakes to his own share. Madame Anderson's feats of eating and walking are recounted at great length in the New York papers. She has eggs and port, and port and chowder, and kidneys with a little drop of Bourbon whisky, and more eggs, and tripe, and so forth, every half-hour. A statistical inquirer has reckoned that she "partakes of refreshment" about sixty times in the course of the day. Meanwhile a friend, known to the American press as "the festive Harry," walks beside her, encouraging her to repeated exertions. As this worthy woman walks all night as well as all day, the public have invented a kind of myth to account for her prowess. No one woman, they say, could stumble on for so many miles, or dispose of so many meals. Therefore there must be two women in the affair, one of whom comes forth, like the moon, during the watches of the night, while the other rejoices to walk her course in the garish day. Madame Anderson has done her best to demolish this myth by singing and speaking to her friendly observers. The voice is the same by day and night, and it is consoling to learn that Madame Anderson has any voice left, especially as, when not a professional walker, she is a professional singer.

Some writers have objected that long-distance walking, though it gains a sort of utilitarian respectability by adding to the greatest happiness of the greatest number, is of no practical use. Though it is a noble thing to walk across Africa, or round the Gulf of Carpentaria, it is less worthy to totter round the Agricultural Hall. It is observed that neither Mr. Eyre nor Mr. Cameron in his pedestrian explorations was accompanied by "the festive Harry" or by a brass band. When these gallant travellers were tired they could not relieve themselves by pushing a roller (as the professional walkers do), nor were they presented with bouquets of flowers, which is the graceful and stimulating custom in America. Again, they got no port, chowder, beaten-up eggs, beefsteak, tripe, nor any other luxuries. They were often glad to dine on the inside of a camel's foot, which is about as savoury and nourishing as the sole of a lawn-tennis shoe. The sun, the rain, the wind beat on them; in fact, they walked for a worthy object, under natural conditions, while the O'Learys and Madame Andersons walk for money, under artificial conditions.

It is to meet and triumph over these objections, we presume, that Weston has started on a long walk in the open air. The papers report the matter at such length that we presume it is highly important. We still miss the details given so freely by the American press. We do not know what Weston had for dinner before he "set himself," as the *Times* says, "to a task which has all the charm of novelty." This charming task is to walk two thousand miles in eight hundred and fifty-six hours, and to deliver fifty lectures on walking, in the towns by the way. Three judges accompany Weston in an omnibus, and see that he takes no cross cuts, and that his lectures are up to the mark. The lecturer started at midnight on Friday last, and was lost in the darkness in the neighbourhood of Greenwich. When he got to Canterbury he had some beef tea, and he lectured at Folkestone to an enthusiastic audience. At Hastings there was "little cheering, but great curiosity." In the small villages "the one sentiment is unmitigated astonishment," with which we respectfully sympathize. "The majority of the spectators come to their cottage doors, and stand with their mouths open till he has passed by." After all, then, people who do not see the fun of long walking have the rural vote on their side. It appears that at a later stage, at Winchester, the populace took offence at Weston's wishing to avoid them on account of fatigue, and instead of plaudits greeted him with stones.

Weston, who is no doubt a powerful man, with great force of endurance, is still pretty fresh, and therefore the newspaper reports are uninteresting. The time to read them, or to go by excursion train to see the walker, will be at the end of his fifth week. Then, if ever, he will be nearly dead of exhaustion. Then the match will grow exciting. Time, against whom Weston walks and talks, will begin to creep up close to the athlete and will give him many an hour of agony. These hours will be the topic of elaborate descriptive reports. We shall see, in fancy, Weston limp and reel; we shall hear him gasp; we shall perhaps witness more than one moment of interesting collapse. The American's condition will be not more enviable than that of the Benician youth in the last round with Sayers. There will be no breaking the ring; the solitary combatant will have to continue his struggle against unwearying Time and Space that are never distressed. The last lectures will be very gratifying, especially as we learn that O'Leary in his last long walking match entirely lost his voice. O'Leary, to be sure, had not wagered that he would lecture, so the loss of his voice was of less importance.

It is possible, of course, that Weston may accomplish his task without difficulty. He is certainly a fine specimen of strength and "pluck," and he is allowed to rest on Sundays. He may come in as fresh as the rower in Gautier's story, who outstripped the galley of Cleopatra without showing one bead of sweat on his marble brow. If the walker has that measure of success, one good result will follow. Long-distance walking will lose some of its popularity. People are only excited by the closeness of the struggle between Time and men's power of breathing and moving. It is the agony of the last efforts that interests the sporting public. Perhaps it may be said that the spectators are edified by an example of fortitude. The fast shopboy, the photographer's young man, the sporting apothecary will try, in their humble way, to rival the courage of the long-distance walker. This may be so. The same excuse has been made for cock-fighting, which certainly appears to us a much more generous and exhilarating sport than long-distance walking. Providence, as one of George Eliot's parsons remarks, has provided cocks with spurs, and with the instinctive love of combat, and it may be a pity to balk them. Providence, happily, has not gifted women with Madame Anderson's powers of eating and drinking, nor with an instinctive love of walking round halls by day and night. The taste for long-distance walking is an acquired one; and we shall all have to acquire it, or else to suffer daily from long, unreadable reports of deeds and sufferings in which we can take no interest. Really if newspapers must

have sporting news at a season when there is no sport, they would do better to fall back on a game of skill, like skittles. Why have we no champion skittleist, and no "international matches"? Anything would be better than long walking matches.

REVIEWS.

MR. GRANT DUFF'S MISCELLANIES.*

MR. GRANT DUFF has proved himself by speech and writing to be the best-informed public man in England since the death of Sir George Lewis. Though he makes no pretension to the character of a profound scholar, he is familiar with the literature of Greece, Rome, England, France, Germany, Italy, and Spain. He has travelled through nearly all parts of the civilised or semi-civilised world, and he is personally acquainted with all the eminent men of Europe. He is himself a botanist, and he has sufficient scientific knowledge to enable him to profit by the society of geologists, chemists, and physiologists; and, in spite of vast and varied attainments which might seem to require the exclusive labour of a lifetime, he has long been one of the most active members of the House of Commons, and for several years he held an important office. Of political subjects as they successively become prominent he generally knows too much to be a mere partisan; but, as the Admirable Crichton used to challenge all comers either to fence or to dispute on the Aristotelian philosophy, Mr. Grant Duff possesses the pugnacious instincts and aptitudes of a Parliamentary combatant. A certain intellectual tendency to intolerance supplies the place of ignorant prejudice by giving point to sarcasm and supplying due acrimony to invective. Encyclopædic learning perhaps multiplies points of hostile contact by providing an extended field for the association and collision of ideas. In a biography of the Spanish orator Castelar, Mr. Grant Duff takes occasion to draw a parallel between a notorious ringleader of the Parisian Communists and Lord Beaconsfield, who has never murdered any hostages. The habitual laxity of the least accurate of statesmen is naturally distasteful to an omniscient adversary. Although Mr. Grant Duff never violates the laws of party discipline, he must sometimes have found his loyalty strained by obedience to a leader who, when he was Prime Minister, expressed in the House of Commons a doubt whether the German Emperor had ceased to be King of Prussia. Mr. Grant Duff understands better than Goldsmith the conditions of English public life. The philosophic orator

> Who, fraught with all learning, kept straining his throat
> To persuade Tommy Townshend to lend him a vote,

knew that a vote which might perhaps shake a Ministry was a more valuable commodity than the barren admiration of scholars. It is satisfactory to find that profound study leads to the same preference of practical results to theories which ordinary Englishmen learn almost unconsciously by tradition. If Mr. Grant Duff's opinions seem, from some passages in this volume, to incline to republicanism, he habitually prefers moderation and compromise to more summary political methods. For implicit confidence in the wisdom of the dominant multitude he substitutes a consoling belief in the supposed indisposition of voters to meddle with matters which they do not understand. "It is wholly impossible," he said in 1874, "that the average elector could interfere in the details of either foreign or Indian questions, if he wished to do so." In 1876 the average elector, at the instigation of Mr. Gladstone, interfered in the details of the Turkish question so effectually as to cause, or to facilitate, the Russian invasion. In 1879 Mr. Grant Duff's political friends are, with fair prospect of success, appealing to the average elector to reverse in all details the Indian policy of the Government and of both Houses of Parliament. The fleas, to use Mr. Grant Duff's happy illustration, did not pull Curran out of bed, because they were not unanimous. Unfortunately human fleas have a tendency to become unanimous. The qualified apology for popular suffrage is part of an answer to Mr. Greg's well-known "Prophecy of Cassandra." Both the pessimist and the optimist can urge plausible reasons for their opposite anticipations. It is pleasanter to hope than to fear, especially when it is too late to escape from the current which may or may not end in a cataract. Mr. Grant Duff ingeniously undertakes to reassure English alarmists by placing a Cassandra-like forecast of evil in the mouth of an imaginary Russian. One of the discouraging propositions advanced by the Russian patriot is that the dream of encroachment on the European dominions of Turkey is entirely baseless. "The time is passed in which Russia might well have appeared a Heaven-sent deliverer to Greeks, Bulgarians, Roumanians, and Servians alike." The controversy with Mr. Greg ended immediately before Russia stimulated an insurrection in Bulgaria and a war in Servia, and led Roumania into a wholly unprovoked invasion of Turkey. Much candour is shown in the republication of sagacious prophecies which have no defect except that they have been falsified by results. In no part of his reply to Mr. Greg is Mr. Grant Duff so deeply in earnest as in his contention that "the religious sentiment itself, as seen in the highest forms of Christian life and practice," is neither impaired nor endangered by the modern progress of thought. "Religion," he says, "is decidedly widening the area of its sway in the domain of human conduct." As a proof of the safety of Christianity, Mr. Grant Duff quotes with approval the dying language of Strauss, and he contemptuously denounces the "bungling sophists" who "yelp at our modern masters of those who know, our Darwins, Huxleys, and Tyndalls." It is difficult to understand how he differs from those who, without criticizing the conclusions of the Strausses or the rest, merely suggest that the transition to their opinions from dogmatic belief may perhaps produce social disturbance and political danger. No superstition is more baseless than the delusion that religion can survive dogma. It is but an idle misuse of speech to give the name of religion to something else.

One of the most ambitious essays in the present collection begs the question to which it relates in its title of "A Plea for a Rational Education." Of the two absolutely irreconcilable theories of education, Mr. Grant Duff is the uncompromising advocate of accumulated knowledge as compared with cultivation of the faculty of learning. Partisans of the conflicting doctrines assume with more or less truth that their respective methods indirectly produce the same results which are immediately promoted by their adversaries. Mr. Grant Duff holds that multifarious instruction affords the best training for the intellect; while the supporters of severer studies, and especially of education by means of Latin and Greek, maintain that their pupils will easily outstrip, in the acquisition of any knowledge which they may need in after life, competitors less scientifically trained. To classical education in its ordinary meaning Mr. Grant Duff has a singular antipathy. He even recommends the study of Homer and of Thucydides in good translations as a substitute for the original texts. It must be admitted that he is uniformly consistent. "I utterly abhor," he says, "that doctrine and position that difficulty is a good in itself." He would nevertheless tolerate the Greek of modern Athens, because it may possibly be useful to travellers or diplomatists. That it bears the same relation to pure Greek which the jargon of Hans Breitmann bears to the English Version of the Bible is an accident which Mr. Grant Duff would for purposes of education disregard. To one test which he proposes his adversaries would not object. He thinks that "a well brought up girl of eighteen in an English house is generally, I should say, better educated than her brother who has been at one of our great schools, and who is just going up to Oxford." The girl would not agree with Mr. Grant Duff. Part, though not the whole, of her deference to her brother is founded on the consciousness that while he perhaps knows even less than herself, he knows it incomparably better. A generation of boys brought up, as Mr. Grant Duff proposes, on a diet of "cribs" and cheap manuals will perhaps have to establish their supremacy in the younger domestic circle by other methods. Mr. Grant Duff cherishes all the hatred which might be expected for the exercises which are known at schools as "composition." He would have been shocked at the declaration of an eminent head-master to the gratified father of one of his best pupils, that "the boy has that love of perfection for its own sake which is only to be acquired by the composition of Latin verses." To the objection that Latin verses are not very useful in after life, the experienced teacher would perhaps have replied that in after life the same faculties would be otherwise employed. Lord Wellesley wrote good Latin verses at Eton, but when he was in India he occupied himself not in writing Latin verses but in conquering kingdoms. Mr. Grant Duff is entirely mistaken in thinking that the system which he stigmatizes as old "trained those with whom it succeeded chiefly to be accurate in nonsense." The laws of language, including to a great extent the laws of thought, as illustrated by Thucydides, Sophocles, or Plato, are much the reverse of nonsense. If Mr. Grant Duff had not learned Latin and Greek when he was a boy, he would probably still have been a prodigy of knowledge; but for ordinary students an accumulation of miscellaneous "cram" is almost wholly worthless. An exception may be made in favour of learning to speak French, or at least to pronounce it. The knack is more difficult to acquire in maturity than the arts of riding, swimming, or dancing, which ought for similar reasons to be taught as early as possible. Volumes have been written on both sides of the controversy, and the series will be indefinitely continued. Mr. Grant Duff cannot be summarily confuted; but it is the duty of those who think that he is fundamentally in the wrong to protest against the sanction given on his high authority to one of the most plausible and popular of errors.

Mr. Grant Duff has selected a less hackneyed topic in an elaborate account of the life and writings of Emilio Castelar. Unfortunately few Englishmen habitually read Spanish, and there is probably only one who has had the industry to make himself acquainted with the writings of the most voluminous of authors. Among many other accomplishments Mr. Grant Duff possesses the gift of accurate and idiomatic translation. His quotations from the speeches confirm the general impression that Castelar is a great orator, and his numerous extracts from publications otherwise unknown illustrate his own patient industry. Mr. Grant Duff will scarcely impress upon his readers his own opinion that his hero, though "a democrat of the democrats, the mortal enemy of kings, aristocracies, and priests," is nevertheless "extremely unlike most of the distinguished republicans of whom they have heard; so unlike as almost to mark the end of an old and the commencement of a new era." A declaimer about "the immaculate banner of William Tell and of Washington" strongly resembles the

* *Miscellanies, Political and Literary.* By Mountstuart E. Grant Duff, M.P. Macmillan. 1878.

numerous rhetoricians who since the days of the Gironde and the Mountain have served the cause of liberty by jumbling up fabulous legends with the prose of history. "Señor Castelar will wait long and patiently; he will rely only upon the written and spoken word; but *Delenda est Carthago* is his message to all that is not republican." The monarchical Carthage will be glad to learn that since the ignominious collapse of his early agitation Señor Castelar will be content to talk, instead of promoting popular insurrections and military conspiracies. In one of his early works, called the *Formula of Progress*, Señor Castelar drew up a string of twenty so-called ideas, which might as well have been ten in number, or fifty, or a hundred. The fifth in order is universal suffrage, which supersedes all the rest. The sovereignty of numbers, once legally established, is intrinsically absolute. If it overrules the other nineteen ideas, some of which are not irrational, the champions of free trade, of direct taxation, or of liberty of the press or person, have only the choice of submission or rebellion. The simultaneous consecration of personal despotism and of the rights of man would be equally consistent and equally secure. It matters little or nothing whether Mr. Gladstone and Señor Castelar would in their respective countries tolerate or reject an ornamental sovereign as an appendage to universal suffrage. The experiment which has been frequently tried in Spain with comparative impunity might prove fatal to a higher organization. When Señor Castelar was for a few months at the head of affairs in Spain, he had the good sense to suspend the operation of universal suffrage, by dispensing with the services of the Cortes. On the reassembling of the Legislature universal suffrage revenged itself by dismissing Señor Castelar; and a day or two afterwards the Cortes themselves were, amid universal satisfaction and in defiance of universal suffrage, turned out of doors by a judicious military commander. Mr. Grant Duff's list of Castelar's literary productions suggests a feeling of surprise that he should have found time to succeed as a demagogue, and to fail, in spite of laudable inconsistency, as a ruler. One of his later works is described by his eulogist as a pamphlet of five thousand pages; and, from the specimens which are given, his other writings appear to be equally diffuse, declamatory, and tedious. His master and model, both in literature and in politics, was Mazzini, and modern Spanish is as florid and as verbose as modern Italian. One composition has been too much for Mr. Grant Duff himself. "I have only read snatches of *La Redencion del Esclavo*, a prose drama; and, if I had, my readers would hardly thank me for dwelling much upon it when I tell them that it is in four volumes and that the Almighty, the Angels, Adam, Eve, Brahma, Siva, Jupiter, Antony, Cleopatra, Spartacus, Hermes, Asoka, Nala, Damayanti, Saul, Samuel, and Jephthah are only a few of the interlocutors." There are also novels to form additional proofs of an inexhaustible and inflated garrulity which is only redeemed by its combination with a great and undoubted gift of oral eloquence. If it is almost incredible that so great an abundance of verbiage should be compatible with wisdom, Señor Castelar has shown that he has both honesty and practical vigour. Having done his best to render government impossible in Spain, he finally, in concert with other Federal Republicans, succeeded in disgusting King Amadeo with the throne which he had shortly before been solicited to accept. On the abdication of the King, the minority of the Cortes, of whom Castelar was a leader, proclaimed a Republic; and a new election, in which according to Spanish custom only the dominant faction took part, returned a Republican Assembly. By previous intrigues the demagogues had effectually demoralized the army, and the establishment of a Republic was consequently accompanied by a Carlist war in the North and an ultra-Republican rebellion instituted on the purest principles of Federalism at Carthagena. After the overthrow of two or three Ministers, each more dishonest and more incapable than the other, Castelar, on assuming office, had the courage to repudiate all the principles to which his life of empty talk had been devoted. Having made himself dictator, he did his best to restore the discipline of the army, and if he had remained in power he would perhaps have suppressed the rebellion at Carthagena. Since that time he has never relapsed into the heresy of the Federal Republic, which is the Spanish equivalent of the French Commune. His eloquence and his personal integrity command respect from a hostile majority in the Cortes; and, as he is still in the prime of life, he may perhaps compensate by future service to his country for the mischief which he caused when he was the loudest of the blatant herd of "intransigent" Republicans. Mr. Grant Duff, admiring Castelar's early career, is naturally not less sanguine in his anticipations of his future triumphs. It may almost be thought strange that a politician and man of letters who is as remarkable for minute accuracy as for universality of acquirement should cordially sympathize with the most wordy and superficial of cosmopolitan theorists.

OLD PARIS.*

THE utility of books of this kind is, we suppose, to familiarize people with the names and with some of the characteristics of historical personages when they have not time or inclination to study them in history itself. If the reader stops short there, he will have gained something, but something of doubtful value; for the effort to make the book always amusing effectually prevents the writer from going much beneath the surface, and history so treated resembles a superficial kind of *genre* painting in which costume is the main thing, and a visible peculiarity of little or no importance attracts attention at once, while those characteristics which are not visible are passed over as unsuited to the purposes of art. To say that Lady Jackson's book is superficial does not necessarily imply censure, for we suppose she intended it to be superficial, and purposely treated her materials in such a manner as to render them acceptable to a novel-reading public. The way in which a book of this kind may be concocted is familiar to all who understand the art of book-making. You read or skim a quantity of memoirs, you even dip a little into the pages of the graver historians, and then, after taking notes, you set to work with facile pen to tell the story over again as your readers may have the patience to receive it; in other words, you eliminate as much as possible everything that might require an effort in the reader, and try to make him pass a pleasant and an idle hour. The result in the present instance is more than seven hundred pages of downright gossip, which is not the less gossip because the people who furnish the subjects of it are all dead and buried long ago.

It seems a pity that, as Lady Jackson has selected French history as the field of her literary enterprise, she should not have fully realized the desirableness of an acquaintance with the French language. The book is "dedicated to Mrs. M. Franks, by her affectionate friend, Catherine Charlotte Jackson; in remembrance of a pleasant reucontre, some years ago, in the gay city of Paris"; and the reader is hereby informed that Lady Jackson has been in Paris, and has learned French enough to spoil her English, for she uses "reucontre" instead of *meeting*, which an unsophisticated Englishwoman might have been satisfied with. Unfortunately, a single word does not constitute a language, and Lady Jackson has a perilous habit of introducing French in such a manner as to betray her ignorance repeatedly. A sound French scholar always puts his accents right, for the simple reason that, even if his memory failed him, his ear, from the mere habit of correct pronunciation, would tell him what accent to use or not to use. Lady Jackson rises superior to these matters of detail, and gives us due notice what to expect so early as the fifth page of the first volume:—

> The ladies of a literary bent composed "dévises d'amour," as posies for rings and other jewels, or, when ambitious of higher flights, wrote licentious verses and tales after the manner of those of Marguérite de Valois, the King's sister.

We suppose it must be a morbid anxiety not to omit an accent which makes English people, especially ladies, so ready to put them where they do not exist, but really Lady Jackson ought to know two such familiar words as *devise* and *Marguerite*. Nor is this only a momentary oversight. She goes on adorning Marguerite with an acute accent all through her two volumes. And these are not the only instances. She turns *menace* into *ménace* in page 21. What is still worse, Lady Jackson cannot even quote or copy. She makes Boileau talk of "caractères bien suivés," as if Boileau ever wrote such school-girl French as that; and she says we are told of Madeleine de Scudéry, "qu'elle possédait *toutes* les charmes, sauf *celle* de la beauté physique." On page 162 (Vol. I.) she says, "Voiture and young Pisani often amused themselves by guessing who and what the people were who occasionally passed the Hotel. A grave-looking personage in a coach was guessed one day by Voiture to be '*un homme de la robe.*'" The expression is possible, but the usual form, *un homme de robe*, is more probable. The proof that Lady Jackson does not always quote Voiture correctly will be found in the third line of the following impromptu:—

> Je pensais si le cardinal—
> J'entends celui de la Valette—
> *Pouvais* voir l'éclat sans égal
> Dans lequel maintenant vous êtes;

and again, in the following bit of prose, also from Voiture:—

> Je découvris des pays que je n'avais jamais vu et des mers que je *n'avoit* point imaginées.

Most of our readers will remember the incomparably proud motto of the Rohans:—

> Roi ne puis,
> Prince ne daigne,
> Rohan suis.

Lady Jackson spoils this grand laconic *devise* by introducing four improvements of her own. She puts a pronoun into each line and alters prince to duke. This is her version:—

> Roi, je ne puis,
> Duc, je ne daigne,
> Rohan je suis.

The wonder is that Lady Jackson, whose book abounds in errors, should have had just sufficient consciousness of them to put two short tables of errata at the beginning of each volume. For example, she has discovered between the printing and the binding of her book that the plural of *chef-d'œuvre* is not *chef-d'œuvres* (as she has given it all along), but *chefs-d'œuvre*, and she is good enough to give us the benefit of this discovery. She also confesses that *il y a* should not be written *il y à*. We take note of these signs of amendment, but complain of the unmerited ill-usage of poor Ste. Geneviève. Lady Jackson, having already inflicted one accent too many on this unoffending saint, thinks to mend matters in her table of errata by adding yet another. Why not complete the improvement by accenting the final *e* as well? Généviève is very near perfection; Génévièvé would fully attain it.

The reader is not to infer from Lady Jackson's wonderful French that she has not been able to get together a rich medley of mate-

* *Old Paris; its Court and Literary Salons.* By Catherine Charlotte, Lady Jackson. 2 vols. London: Richard Bentley & Son. 1878.

rials. Her volumes remind us of the Scotchman's apology for the haggis, a dish which at first sight is seldom very attractive to Southern taste. He said that whatever might be said against it, "there was a deal o' fine confused feedin' aboot it." So it is with Lady Jackson's book, and we acknowledge with alacrity that she has quite mastered the art, more difficult than some critics may imagine, of patching a vast quantity of materials together without showing the joints. Her style is light and readable, though it would be infinitely improved by the omission of French phrases, and if she is not a profound social critic, she does not often attempt what is far beyond the limits of her powers. The effect of literature of this kind on the public, so far as it may succeed in substituting itself for thoughtful history, will be to encourage the English habit of seeing only the light and trifling side of French affairs. The note is struck in the dedication itself, where Lady Jackson calls Paris "the gay city." Yes; no doubt it is the gay city for foreigners or French provincials who go to amuse themselves there, and the general aspect of the place is cheerful and enlivening; but for those who have to earn their living in Paris, and they are the large majority, life is just as serious a business there as it is in London. This is what foreigners, bent on amusing themselves, never seem to understand. The real difference between Paris and London is that Paris lays itself out to please and amuse visitors, whereas London is arranged for the convenience of its own inhabitants, and does not apparently very much care for the pleasures and comforts of people who do not belong to it. The first impression of London is generally disagreeable; the first impression of Paris is (especially since the improvements) generally delightful. After knowing both cities intimately for twenty years, and the seriously occupied inhabitants of both, we are likely to arrive at the conclusion that most lives are serious and that some are frivolous in both capitals.

Lady Jackson's book begins with the 14th of May, 1610, and she characteristically opens with a State pageant. The style of treatment adopted throughout the work, which has the merit of a perfect unity of style and manner, will be at once understood from the opening. The experienced reader will see that Lady Jackson strikes her first note boldly and without hesitation, and that she throws herself at once into the intended measure. She goes rattling on in the same style to the end of her seven hundred and fifty pages, always treating the materials of history as lightly as it is possible to treat them.

> It was the 14th of May, 1610. Workmen to the number of eight hundred, or more, were employed in decorating the old city of Paris for a grand state pageant, arranged to take place on the 16th. Marie de Médicis, the second wife of Henry IV., was then to make her public entry into the capital as the newly-crowned Queen of France. Her coronation, so long earnestly desired, so long delayed, she had prevailed on the King, after ten years of scolding and coaxing, threatening and entreating, to consent to. The cherished wish of her heart was obtained, and she had been crowned with the utmost pomp and solemnity, on the previous day, at St. Denis, by Cardinal Joyeuse.
>
> Little or no sympathy or affection existed between Marie de Médicis and her husband. His mistresses—less by their beauty than by gaiety and good-humour—held an influence over him which probably she herself might have acquired could she have curbed her violent temper. But not only did she rave, and rage, and assail him with angry words, it was even sometimes necessary to restrain her from the free use of her hands. And her blows were far from being light ones, for, as Henry once justly said, she was "terribly robust." From time to time whispers had reached her of the King's intention to seek a divorce, on the ground that a promise of marriage given in years gone by to the Marquise de Verneuil invalidated any subsequent union contracted by him. Henry had not a very scrupulous conscience, but these whispered reports originated solely with the intriguing Marquise. He entertained, at least, a kindly feeling towards Marie, notwithstanding her attacks upon him, and publicly paid her the respect due to the mother of the daughter of France.
>
> But her brow had cleared since it had been graced by a crown. She was radiant with delight; for she had achieved a real triumph—one especially gratifying to the feelings of a woman of her violent and vindictive character—the Marquise de Verneuil, the King's mistress, and the Princess Marguérite de France, his divorced wife, having both been compelled to witness that triumph, and even to enhance it, by joining the train of ladies appointed by Henry to form her *cortége*. Her dark Italian eyes, which so often flashed with angry indignation on her faithless spouse, were then lighted up with a gleam of proud satisfaction that but few had observed in them before—Henry, never.
>
> The King had taken no part in the ceremony; he was present merely as a spectator. But when the royal procession passed up the nave of the old cathedral, preceded by archbishops and bishops in their richest vestments; the Queen, surrounded by the noblest and fairest ladies of her Court, and arrayed in splendid robes and sparkling gems that well became her florid complexion and portly figure (she was in her thirty-seventh year), and wearing with dignity the royal mantle—which, heavily embroidered in fleurs-de-lis of gold and pearls, was borne by pages of honour—Henry, turning towards his Minister and friend De Sully, exclaimed, in an animated tone, "Ventre Saint Gris!—Qu'elle est belle!"

There really is a great deal of *go* in this style of narration, as the reader perceives; and we are of opinion that no writer of the male sex could keep up the pace without flagging, as Lady Jackson does. Another quality in which she easily distances all possible masculine rivalry is in the attention she gives to the details of dress. Whenever little facts about costume are attainable she gives them with that minute interest which astonishes us in ladies who observe their living rivals. For some time we vaguely thought that Lady Jackson reminded us of some other writer, and at last we remembered our old friend the writer of the Court Circular. We are told that Marie de Médicis appeared on the 15th of May in the flowing black robes of a royal widow with a veil of gauze taffetas reaching to her feet, and a full-plaited ruche of white gauze encircling her throat, the ends fastening in front like a scarf, with bows of black riband. The little king Louis XIII. wore a violet velvet dress and a plumed hat of the same colour. The day before, when Henri IV. had been to visit Angélique Paulet, that young lady wore a morning dress of blue silk. Part of her hair, which was of a deep golden colour, was twisted with a string of pearls and a blue riband, and part fell in long curls on her shoulders. The dress was made high, but open at the throat, displaying a necklace of diamonds set in gold, with a border of black enamel. Her sleeves were looped back with blue ribands, and her bracelets were of the same pattern as the necklace.

Lady Jackson consistently devotes almost as much attention to upholstery as to dress. She is careful to describe interiors when she has authentic materials. Here, for example, is an interesting description of the *salon bleu* at the Hôtel de Rambouillet:—

> The marquise is said to have been the first to innovate on the custom of colouring or painting the rooms of a red tint or a tawny dark yellow. Hence the admiration bestowed on the "*salon bleu*," apart from its being the principal *salle de réunion*. Its walls were hung with blue velvet, impanelled in borders of gold. The furniture was of the same material, relieved by gold fringes and lace. "The air was perfumed with the odour of flowers arranged in beautiful vases and baskets, and in such profusion that eternal spring seemed to reign there." In the evening the *salons* were lighted with lamps of Venetian glass, also first seen at Rambouillet; and there were splendid Italian cabinets, filled with the choicest and rarest specimens of delicate sculpture, scarce enamels, gems, and other articles of *vertu*. Amongst the many treasures of the *salon bleu* was a spinet, a marvel of its kind, brought by the marquise from Italy. It was exquisitely painted with flowers and birds, and inlaid with turquoise, gold, and pearl.

Here is a description of the Place Royale, in the same style:—

> La Place Royale was considered La Perle du Marais, and that new faubourg (Paris was not then divided into its twenty *quartiers*) became renowned later on in the seventeenth century. Rank and fashion, wealth and beauty dwelt there, and *une société spirituelle* assembled in the noble *salons* of its spacious mansions. Delicate carvings, exquisite paintings enriched the cornices, doors, and ceilings; Venetian mirrors, Florentine tapestry adorned the walls; silks, damasks, and rich brocatelle covered the gilded *fauteuils* and *canapés*.

There are very many descriptions of this kind in the two volumes, but the above may serve as specimens. The more difficult task of describing the minds of the people who frequented these fine rooms has not been evaded by Lady Jackson; but here we feel the insufficiency of such light and general sketching. We want to know the people better, more individually; and, instead of close and powerful character-painting, we get generalities like the following, which are in part simply conjectural:—

> The *salons* of Rambouillet afforded, no doubt, many examples of high-flown sentimentality and affectation as well as of over-strained or stilted politeness. And it has been suspected that before the period of its greatest vogue and importance (from 1635 to 1645) there existed amongst the society that frequented the hotel, composed as it was of persons of such different social grades, a carefully suppressed undercurrent of mutual disdain. The pride of birth, the pride of intellect, the pride of purse, each received a shock from the presence of the others, and could not immediately amalgamate, though represented there only by the *élite* of each class. It argues in the hostess the possession of a high degree of tact and social *savoir faire* to have succeeded so happily in soothing the ruffled spirits of her high and mighty guests, and bringing the discordant elements in her circle to act so favourably on each other as to produce that general tone of good breeding, that courtesy of manner, that suavity of expression—indicating respect for others as well as self-respect—which characterized those who had mixed with the *société polie* of Rambouillet.

The intellectual value of Lady Jackson's book is very small, but she has skimmed an immense mass of materials, and given the result in a form which may be acceptable to many readers, especially of her own sex. Lady Jackson is far more at home in describing the dress of a woman than in analysing the mind of a man. The attempts at portraiture when famous men have to be talked about are feeble in the extreme; for example, the short accounts of La Rochefoucauld and Pascal, which are nothing but repetitions of old commonplaces, the commonplaces of people who did not and could not understand either the one or the other. The real merits of the book are, first, its sufficiently clever dealing with the external life of frivolous people, especially women, and, secondly, a considerable literary skill in the treatment of overwhelmingly abundant materials. Lady Jackson deals with the outside of Parisian life and French history from the assassination of Henri IV. to the death of Louis XIV. Notwithstanding her surprising inaccuracy as a French scholar, she has been an industrious reader, and it is likely that her volumes may be of use to many ladies as a dose of history in its lightest possible form.

PREJEVALSKY'S LOB-NOR.*

COLONEL PREJEVALSKY is a most indefatigable explorer. During the last six years he has made as many expeditions into the almost unknown portions of Central and Eastern Asia. He has travelled in Mongolia; he has visited the Chinese Province of Kansuh; he has passed several months in the Lob-nor district; and he is now about to try to make his way into the forbidden land of Tibet. Such enterprise is deserving of all praise; and we who, through the medium of Mr. Delmar Morgan's translation, enjoy some of the fruits of his labours, should be most grateful to him. It is, however, somewhat amusing to find him naïvely expressing surprise that the officials and natives of the districts through which he passed should have imagined for a moment that he had any other object in visiting their inhospitable territory than that of "seeing a new country, and

* *From Kulja, across the Tian-shan to Lob-nor.* By Colonel N. Prejevalsky. Translated by E. Delmar Morgan. With Introduction by Sir T. Douglas Forsyth, C.B., K.C.S.I. London: Sampson Low & Co. 1879.

collecting plants and skins, &c." We fear that we also shall excite his astonishment when we say that, while fully recognizing his zeal in the cause of science, we cannot help thinking that the "new country" would not have had the same attractions for him had it not lain in the direction of the gold-fields of South-eastern Asia.

As Sir Douglas Forsyth points out in his introduction to the present work, the Russians have long regarded the gold-fields of Tibet, Khoten, and Yarkand as romantic El Dorados, where wealth and ease are to be easily bought in exchange for trifling labour. More than a hundred and fifty years ago Prince Gagarin, who was then Governor of Siberia, proposed that steps should at once be taken to annex Little Bukharia, and suggested that a series of forts should be pushed along the Irtish as far as Yarkand. At the same time he sent to St. Petersburg specimens of gold-dust which had been procured from the coveted region. In conformity with this advice Ivan Bukholz was despatched, with a force of two thousand or three thousand men, with orders to build a fort near the lake Yamish, and then, if possible, to make his way to Yarkand. The persistent opposition of the Kalmucks defeated the object of this expedition; but in 1718 the fort of Semipalatinsk was built, and two years later the Russians had reached Lake Zaisan. At the present time they occupy Kulja, and have extended their frontier southwards to within 110 miles of Kashgar. It is also reported, though the rumour wants confirmation, that a few weeks since a force of seven thousand Russians was within seven days' march of Yarkand. The Russians have thus pushed steadily onwards towards their goal along the western side of the Desert of Gobi, and the main object of Colonel Prejevalsky's journey of last year to the Lob-nor district and of his proposed expedition to Tibet was and is the thorough exploration of the route to the gold-fields of Khoten and Tibet on the eastern side of the same desert region.

Colonel Prejevalsky, with two companions, six Cossacks and an interpreter, started from Kulja on the 12th of August, 1876. His route lay at first up the fertile valley of the Ili, which is at present occupied by Russia, in spite of the protests of the rightful owners, the Chinese. Here, he tells us, "clean, pretty villages with gardens, shaded by lofty silver poplars, followed each other in quick succession. In the intervals are cornfields irrigated by numerous watercourses, whilst on the meadows along the river's bank large herds of sheep, oxen, and horses are grazing. The population is everywhere apparently prospering." From the valley of the Ili he passed into that of the Kunges, which is equally fertile but wholly uncultivated. Still pursuing his journey eastward he reached the foot of the Narat range, "which, with its eastern prolongations, forms the northern buttress of an extensive and lofty plateau, situated in the very heart of the Tian-shan, and known by the name of the Yulduz."

After traversing the Lesser and Greater Yulduz, Colonel Prejevalsky entered the Kaidu Valley and camped at Kara-moto, where he was well received by the first Tungute inhabitants he had met with. But by "the whole Mohammedan population of the neighbourhood" his arrival was viewed with unmixed alarm. The shots fired by his shooting parties in pursuit of game gave rise to the rumour that a Russian force had appeared on the Kaidu, which no sooner gained currency than a panic ensued among the Mohammedans living near Kara-moto, who one and all left their homes and fled to Kara-shahr. To that place also the Colonel sent notice of his arrival, which was acknowledged three days later by the appearance of six envoys from Korla, who refused to allow the travellers to proceed further until instructions were received from Yakub Beg. After a delay of seven days at Kara-moto the Colonel was allowed to go on to the suburbs of Korla, through which town lies the road to Lob-nor. Here the same annoying restrictions were enforced on the travellers that fettered the action of Mr. Shaw and Sir Douglas Forsyth on their expeditions to Kashgar. A guard was placed over his party under the plea of giving them protection, and they were forbidden to enter the town or to converse with the inhabitants. "To all our questions," writes the Colonel, "as to the town of Korla, the number of its inhabitants, their trade, the features of the surrounding country, &c., we received the curtest replies, or absolute falsehoods; and this continued during the whole of our six months stay in the dominions of Yakub Beg."

The prospect of a war with China at this time made Yakub Beg unwilling to do anything which would throw the weight of Russia on the side of his enemy, and he therefore placed no positive obstacle in the way of the Colonel's advance; but at the same time he employed every artifice to limit his means of gathering information, and he took care to be well supplied with reports as to his movements by attaching a spy in the person of an ex-Russian subject, one Zaman Beg, to the expedition. Much to the annoyance of the Colonel, this man proved himself to be a most loyal servant to his master. At first, starting from their camp outside Korla, he led the travellers by a circuitous path across the fields in order to prevent them seeing the town, and throughout their journey he watched their every movement and thwarted as often as he was able all attempts to see more than was visible from the road on which they travelled. He kept up a regular correspondence with Yakub Beg, and not a week elapsed without a courier arriving "either from Badaulat (Yakub Beg) or the Tokhsabai 'to inquire after our well-being,' as Zaman Beg naïvely expressed it."

True to his instructions, Zaman Beg led the Colonel to the valley of the Tarim by the most difficult route, obliging him most unnecessarily to swim two large and deep streams. Here the travellers entered upon the Lob-nor desert, "which," writes Colonel Prejevalsky, "is indeed the wildest and most barren of all the deserts I have seen, surpassing in this respect even that of Alashan." Reeds growing in the marshes bordering on the river are the only signs of pasture in this cheerless region, and the presence of these is due only to the ingenuity of the natives and the violence of the winds:—

> Fine sand and dust [we are told], driven by the wind-storms prevalent in the spring, are caught and retained by the trees, bushes, and cane-brake growing on the banks, so as gradually to raise their level above that of the adjacent land, which is constantly diminishing under the influence of the same causes. Hence it becomes only necessary to bore through the bank for the water to pour out of the river and inundate a more or less extensive tract of plain. With the water come fish, and in a little while reeds begin to grow. After a time the channel gets silted up, the lake grows shallower, the fish are easily taken, and the recently submerged land affords pasturage for sheep. When the reeds are all fed off the operation is repeated, and a fresh supply of fish and pasturage obtained.

The natives are fit inhabitants of such a desolate district. The men are remarkable for the pallor of their complexions, their hollow cheeks, and weak frames, and the women for their ugliness. Their dwellings are reed huts, with square holes in the roofs to serve the purpose of chimneys; mats are the only articles of furniture which adorn the interiors; fish form their staple food; and their misery is made complete by repeated visitations of small-pox. Wheat and barley are sown in small quantities by the more enterprising squatters, but the saline nature of the soil destroys the prospect of more than the most meagre harvests. Such are the people and such is the Tarim Valley, down which Colonel Prejevalsky journeyed in search of Lob-nor. The whole of November and part of December were occupied in travelling through this district, and when at the end of that time the goal of his journey was within easy reach, Zaman Beg led him past it to the village of Chargalyk, where he was minded to winter. In the beginning of February, however, this obstructive guide consented again to start for the lake, the shores of which were reached without much difficulty.

Thus Colonel Prejevalsky believed himself to have solved the difficulty as to the position of Lob-nor, which has perplexed geographers from the time of Marco Polo downwards. But instead of one lake the Colonel found two, known respectively by the natives as Kara-burau and Kara-koshun. The Tarim enters the former at its western extremity, and, after flowing through it in an easterly direction, "appears as a river of some importance, but it soon rapidly diminishes, owing to the numerous canals by means of which the inhabitants draw off the water for fishing purposes. On the opposite bank the neighbouring desert continually encroaches upon the land capable of cultivation, scorching with its fiery breath every spare drop of moisture, and finally arresting the further progress of the river eastward. The struggle is over, the desert has gained the mastery over the river, life is swallowed up in death. But, before finally disappearing, the Tarim forms, by the overflow of its last waters, an extensive reedy marsh known from ancient times as Lob-nor." The lake is shallow throughout, and the water, except round the shores, is clear and sweet. Saline marshes surround the lake and on the south side extend to from eight to ten versts, beyond which a pebbly plain rises gradually to the foot of the Altyn-tagh range.

In many essential points this account of Lob-nor is at variance both with the best Chinese maps and with the evidence of Oriental travellers who have visited the lake. According to Chinese geographers, the Tarim takes throughout a north-easterly course, and, after meeting with the Koncheh-daria, which runs into it from the north, it pursues its undeviating way until it loses itself in the waters of Lob-nor, in about latitude 40°40', and longitude 88°30'. The main lake, which is also known as the Salt Lake, from the brackishness of the water, is, they say, surrounded on the north and south by a series of smaller lakes, known on the north as the "Grass Lakes," and on the south by special names; while a more extensive plain than that which separates its northern shore from the Kuruk-tagh range stretches from its southern border to the Altyn-tagh. The comparative accuracy with which they have laid down the positions of Karashahr, Korla, and the Bostang-nor renders them entitled to some confidence on the subject of Lob-nor; added to which their description of the lake is fully borne out by the accounts given of it by Chinese and other Eastern travellers.

But the fact remains that Colonel Prejevalsky followed the course of the Tarim, after its junction with a river he calls the Ugen-daria, in a south-easterly direction until finally it disappeared in two fresh-water lakes lying near the foot of the Altyn-tagh range, in 39½° N. lat. and 89° E. long, the largest of which he declares to be Lob-nor. On the publication of the Report of Colonel Prejevalsky's journey these discrepancies at once attracted the attention of Baron Richthofen, who suggested an explanation which will probably be found to be correct. The ease with which in such regions rivers change their courses is well known; and the facility with which, as we have seen, the natives are able to divert some of the waters of the Tarim for their own purposes, is sufficient to show that that river is no exception to the rule. It is by no means improbable, therefore, that the force of the Ugen-daria running into the Tarim from the north may have created a channel southwards for some of its waters, while the main stream still pursues its way eastward into the true Lob-nor. As Colonel Prejevalsky's route lay southwards between two separate arms of the Tarim, and subsequently along its western bank, he would very possibly be unable to trace an outlet to the eastward such as Baron Richthofen believes to exist. Further, on the Chinese maps is laid down a small lake close to Colonel

Prejevalsky's Lob-nor, and if we may suppose this to have received the waters of the southern branch of the Tarim, we may readily imagine that it might perfectly answer the description here given of Kara-Buran and Kara-koshun.

If this be so, then the professed object of Colonel Prejevalsky's journey remains unfulfilled. But his labours have not been in vain. His description of the physical features of the Yulduz valleys, the Kuruk-tagh range, the valley of the Tarim, and especially of the Altyn-tagh range, are additions of great importance to our knowledge of the geography of Central Asia. The enforced brevity of Colonel Prejevalsky's notes on these and other subjects of interest is much to be regretted, more especially since, as we are told in the preface, the conciseness of the narrative is due to the great physical prostration under which the author has been suffering from the effects of "hardship and exposure in desert and swamp."

MISS SWANWICK'S *FAUST*.*

OF translating *Faust*, as of translating Homer, there seems to be no visible end; but this is true only of the First Part of Goethe's great work. The Second Part is comparatively little read and little known even in the home of its own language; and the translators who have grappled with its difficulties may easily be counted on one's fingers. It is singular how much alike it has fared with Goethe and with Dante in this respect. The Second Part of *Faust* contains passages and scenes at least equal for poetical power and beauty to anything in the First, and the First Part is evidently incomplete without it. The same thing may be said with equal truth of the *Purgatorio* and *Paradiso* as compared with the *Inferno*, and in this case it will probably command more general assent. As regards difficulty also, the parallel holds in a considerable measure. The philosophical and theological expositions which have given abundant exercise to commentators in the latter parts of the *Divina Commedia*, more especially the *Paradiso*, may be compared to the digressions, discussions, and obscure allusions to modern persons, events, and controversies which puzzle readers of the Second Part of *Faust*. In both cases the difficulties have acquired, in our opinion, an exaggerated reputation, and many persons, vaguely conceiving them as more formidable than they are, do not even attempt to take the measure of them for themselves. Great is their loss, if they are capable of enjoying the thoughts of great poets. For the *Purgatorio* and the *Paradiso* have a serene and lofty splendour which, as it would be out of place in the *Inferno*, so we should vainly seek there; and in the Second Part of *Faust* the episode of Helena, and the vision of the concluding scene, are achievements not only unsurpassed but unique in the whole range of modern poetry. It would seem that the aid of the translator is peculiarly called for to support and encourage English readers in making themselves acquainted with these less known beauties. The greater the difficulties of an important original, the more a good translation is wanted. Translators, however, have mostly been content to follow the timidity of the reading public instead of correcting it; and therefore fragmentary versions of the masterpieces of Dante and Goethe, the greatest poems of the middle ages and of the new time, are to be found in abundance, while complete ones are but few.

The disproportion is more conspicuous in the case of *Faust* than in that of the *Divine Comedy*; and a greater meed of thanks is accordingly due to those who come forward to redress it. Miss Swanwick, whose translation of the First Part has long been before the public, is now added to the list of the few strenuous workers who have taken on themselves the higher and more perfect task. And the work is hard, not only in respect of its own nature, but by reason of that which it has to emulate, the competitors, though weak in number, being of illustrious quality. First to be mentioned is Mr. Carlyle, whose admirable essay on Goethe's Helena contains the version almost of whole scenes from the episode that now stands as the third act of the Second Part; not professing indeed to be finished work, but introduced only to make the text of the reviewer's commentary intelligible to English readers, yet clothed in every line with the power which Mr. Carlyle's hand could not help laying upon it. Then Mr. Bayard Taylor, in whose premature death literature has just suffered heavy loss, has rendered the whole poem in English wonderfully close and wonderfully free from strain and harshness. Line for line and metre for metre he followed Goethe's way, flinching before no difficulties, and seldom otherwise than victorious; a labour so great that no man could have hoped for success who had not in himself enough of the poetic spirit to undertake it as a labour of love. Bayard Taylor's *Faust* is altogether, to our mind, one of the most remarkable feats of translation achieved in any modern language; and some years ago we had occasion to speak of it as holding a place of supremacy among its rivals from which it would not easily be dispossessed. And, with Miss Swanwick's older and newer work now before us, we are still of the same mind. For power and flexibility of language, for faithful embodiment of the spirit and form and tone of the original, for the nameless refinements and shades of sympathy in which a translator hangs between despair and triumph, Miss Swanwick's version must, on the whole, yield to Bayard Taylor's. But the victory is none of those that miss the life and eagerness of a real contest; the race is well and fairly run, and to be second in such a race is better than to have been first in many others. Miss Swanwick may await with confidence, if our memory of other attempts rightly serves us, the comparison of her work with any of its fellows except that which we have placed first. Even as to this, our preference of Bayard Taylor's work as a whole depends more on a general impression of the power of the two versions than on a minute consideration of their respective success in detail. Many passages may be found, and those of the best, where there is really little or nothing to choose. It is only under the stress of the severer difficulties that the inequality of strength becomes marked. There is, indeed, one deficiency peculiar to Miss Swanwick's version, but it is of a kind that English readers will hardly perceive at all. A strain of mocking, ironical, fanciful, but always essentially masculine humour recurs now and again in both parts of the poem; and in these passages, probably not so much from any actual falling off in power as from a very natural absence of sympathy, Miss Swanwick's touch is certainly less happy. Such is the case in that extraordinary episode of the production of Homunculus which has caused infinite shedding of ink and bewilderment of mind to the critics who must needs have a complete explanation for everything. Far be it from us to add to their number; our words shall be few, and, as we hope, discreet. Much of the obscurity which has been found in the Second Part of *Faust* arises from people refusing to face the simple fact that the poem is not the development of any single plan, but a procession of ideas and fancies innumerable, loosely marshalled on the lines which Goethe found ready to hand in the old Faust legend. The vision of Helena, indeed, is a work of art complete in itself, and embodies ideas of sufficient distinctness, which have been explained by Mr. Carlyle with true critical genius, just enough and not too much. When the poet, being in possession of a theme which lends itself only to history and criticism for direct intellectual handling, commands his imagination to dwell upon it, to play around it with varied lights, to clothe it with the richest imagery and glorify it with every form of beauty and stateliness, his purpose is that much should be suggested and little positively revealed. To thrust an over-curious interpretation upon every detail of the work is to misunderstand and thwart this high purpose, and to deal with the poet as if he were a commonplace writer of allegories, in which whatever art the allegorist may have is but the vehicle for a moral. It is only one degree more rational than looking for a train of reasoning in a symphony. Whoever cannot enjoy Goethe's Helena as a thing of exquisite beauty, without defining that which Goethe chose not to define, will surely never enjoy it the more for all the definitions wherewith critics have striven to tie down Goethe's free and invincible genius.

Our little friend Homunculus, who has led us into this path of digression, belongs to the dramatic construction of the poem (though it cannot be called dramatic in the common sense), as a needful harbinger of Helena's restoration to Faust. The manner of his appearance is likewise fitting enough. For that Wagner, left in sole charge of Faust's laboratory, should busy himself with experiments on *generatio æquivoca*, is precisely what one would expect of him; and that his efforts, but for the appearance of Mephistopheles in the nick of time, should be like to have no better issue than those of his forerunners, is what we should expect also. But it is beyond Mephistopheles to finish the work thoroughly. The nature of Homunculus is unfulfilled desire, driving him forth, with Faust as an eager follower and Mephistopheles much puzzled and something vexed at the whole business, to those apparently chaotic dissolving views of the Classical Walpurgis Night, where we lose sight of him and his luminous bottle. Wagner is evidently a type of the mediæval philosophy, which with all its apparatus could make nothing of the spirit of man but a cramped and stunted abortion, fit for nothing but to be corked and labelled out of harm's way in a phial. But negation and discontent come for once to the rescue as life-giving principles; they cannot satisfy, but they can impel man to seek satisfaction elsewhere. With a prescient instinct he flies to the long-neglected wealth of the old Hellenic world; bewildered at first with multitude of shapes and visions, he grows into familiarity and wins clearer sight, until the crystalline walls within which he has imprisoned his own soul expand and lighten, and the magic of art and science breaks them for ever. Is this, then, our interpretation of Homunculus? No; but one possible aspect of the interpretation for those who may be minded to accept it. One thing, however, is free from doubt—that Goethe believed in art, not merely as a recreation and ornament of humanity, but as a very material part of life, not without actual and practical bearing on conduct. As he elsewhere says, "Wer Wissenschaft und Kunst besitzt, Der hat Religion." And one must be able to enter into this belief, at any rate for the time being, in order to understand either *Faust* or any other considerable piece of Goethe's work.

Miss Swanwick has wholly abstained from commentary; a proceeding which has its laudable side, but savours of rashness. *Faust* needs annotation quite as much as the *Divine Comedy*: and those who think this does not apply even to many things in the First Part must have skipped a good deal. The English reader who plunges into a translation of *Faust* without notes of any kind will hardly escape confusion. And in this case the publishers have contrived to increase his troubles by omitting large portions of the text. After informing us that "the unusual degree of popularity accorded to Miss Swanwick's version of the First Part of *Faust* has induced her to complete the work by a translation of the Second Part," they

* *Goethe's Faust.* In Two Parts. Translated by Anna Swanwick. London: George Bell & Sons. 1879.

further tell us that, "in consideration of the length of the Second Part, some portions have been omitted, but care has been taken that the progressive development of the drama should not be interfered with." The omissions are considerable both in quantity and importance; for example, the lament of the Chorus over Euphorion in the third act is struck out. One may guess what manner of welcome Goethe would have given to the proposal to leave "the progressive development of the drama" to such tender mercies as it might get from the scissors of publishers making up a Christmas book. For this, however, Miss Swanwick is obviously not responsible; we can only regret that we have not the full materials for doing justice to her work, and hope that ere long it may appear complete. Neither can we agree with the publishers that the effect of Retzsch's designs is in any way improved by reducing the scale. The reduction was unavoidable to bring them into the book, but it is a poor device to make a merit of it.

We must not omit to give a specimen or two of Miss Swanwick's version, though it is not really possible to judge a performance of this magnitude by samples. The following stanzas are from the monologue uttered by Faust on his first awaking in the opening scene of the Second Part:—

Life's pulses reawakened freshly bound,
The mild ethereal twilight fain to greet,
Thou, Earth, this night wast also constant found,
And, newly-quickened, breathing at my feet,
Beginnest now to gird me with delight;
A strong resolve dost rouse, with noble heat
Aye to press on to being's sovereign height.
The world in glimmering dawn still folded lies;
With thousand voices life the woods resound;
Mist-wreaths the valley shroud; yet from the skies
Sinks heaven's clear radiance to the depths profound;
And bough and branch from dewy chasms rise,
Where they had drooped erewhile in slumber furled;
Earth is enamelled with unnumber'd dyes,
Leaflet and flower with dew-drops are impearled;
Around me everywhere is paradise.

Our other extracts shall be from the Helena; we must repeat our disappointment and surprise that this act at least was not fully given. If space was really so important, it might easily have been gained by a little more cutting short of the Classical Walpurgis Night, which one cannot be expected to read steadily through even in the original. Miss Swanwick has been particularly successful in the unrhymed choruses, from one of which we take a fragment:—

Much have I lived through, although my tresses
Youthfully waver still round my temples;
Manifold horrors have mine eyes witnessed;
Warfare's dire anguish, Ilion's night,
When it fell;
Through the o'erclouded, dust over-shadow'd
Tumult of war, to gods have I hearken'd,
Fearfully shouting; hearken'd while discord's
Brazen voices clang through the field
Rampart-wards.
Ah, yet standing were Ilion's
Ramparts; nathless the glowing flames
Shot from neighbour to neighbour roof,
Ever spreading from here and there,
With their tempest's fiery blast,
Over the night-darkened city.—
Flying, saw I through smoke and glare,
And the flash of the tongued flames,
Dreadful, threatening Gods draw near;
Wondrous figures, of giant mould,
Onward striding through the weird
Gloom of fire-luminous vapour.

As a contrast to this let us turn to the lines addressed by Faust to the leaders of his host:—

With bridled rage and silent power,
Which victory must crown at length,
Ye of the north, the youthful flower,
Ye of the east, the blooming strength!
Steel-clad, with sunbeams round them breaking,
Empires they shatter with their spear;
They march—beneath them earth is shaking;—
They pass—it thunders in their rear.

* * * *

I hail you dukes, for so ordaineth
Sparta's fair queen; before her lay
Mountain and valley; while she reigneth
Ye too shall profit by her sway.

* * * *

Then shall each one, at home abiding,
Prowess and strength abroad make known;
Yet Sparta shall, o'er all presiding,
Be still our queen's ancestral throne.
Rejoicing in their lands, each nation
She sees, with every blessing crown'd;
Justice and light and confirmation,
Seek at her feet with trust profound.

We should be glad to have an excuse for going on to the wonderful last scene of Faust's salvation; but common justice to translators makes this forbidden ground. The obstacles to translation are as desperate at the end of the Second Part as in the Prologue in Heaven which opens the First. Even in the face of Goethe's encouraging words, fit to be remembered and meditated on all occasions of high enterprise, we must think the task all but impossible; yet those words will not suffer us to discourage any who may in earnest attack it:—

Dem Klugen, Weitumsicht'gen zeigt fürwahr sich oft
Unmögliches noch als möglich.

STEVENSON'S EDINBURGH.*

"EDINBURGH," said a visitor, "would be a charming place—if it were not Edinburgh." It is rare to find a Scotchman, nay, an "Edinburgh body," so detached from local prejudices that he can give a verdict not quite unlike that of the paradoxical stranger. Mr. Stevenson can see Edinburgh as she is; he seems to have suffered from the adorers of Burns, and even appears to take a mischievous pleasure in telling his countrymen the result of a dispassionate inspection of their capital. It is not that he is a false Scot who dislikes his "own romantic town." Heine says that the German loves liberty as he loves his old grandmother, with a quiet, undemonstrative affection. Mr. Stevenson likes Edinburgh as a Scotchman likes that peculiarly Scotch kinswoman, an ancient maiden aunt, with features peaked, but not unkind, with frosty hair. He has a keen sense of her bitter moods:—

Edinburgh is beaten upon by all the winds that blow, drenched with rain, buried in cold sea fogs out of the east, and powdered with the snow as it comes flying southward from the Highland hills. The weather is raw and boisterous in winter, shifty and ungenial in summer, and a downright meteorological purgatory in spring. . . . The Scotch dialect is singularly rich in terms of reproach against the winter wind. *Snell, blae, nirly,* and *scowthering* are four of these significant vocables; they are all words that carry a shiver with them.

Edinburgh is not only chilly and nipping, but intensely respectable; and, like the maiden aunt, she keeps hoarded fragments of old brocade, queer examples of *rococo* jewelry, rings with topaz stones beneath flimsy coronets, a hundred treasured keepsakes of her youth, when there was a Court in the town and kings danced at Holyrood. The old glories are taken out now and then, counted over, and displayed to a younger generation:—

The Lord Commissioner, a kind of stage sovereign, sits among stage courtiers; a coach and six and clattering escort come and go before the gate; at night the windows are lighted up, and its near neighbours, the workmen, may dance in their own houses to the palace music. And in this the palace is typical. There is a spark among the embers; from time to time the old volcano smokes. Edinburgh has but partly abdicated, and still wears, in parody, her metropolitan trappings. Half a capital and half a country town, the whole city leads a double existence; it has long trances of the one and flashes of the other; like the king of the Black Isles, it is half alive and half a monumental marble. There are armed men and cannon in the citadel overhead; you may see the troops marshalled on the high parade; and at night after the early winter evenfall, and in the morning before the laggard winter dawn, the wind carries abroad over Edinburgh the sound of drums and bugles. Grave judges sit bewigged in what was once the scene of imperial deliberations. Close by in the High Street perhaps the trumpets may sound about the stroke of noon; and you see a troop of citizens in tawdry masquerade; tabard above, heather-mixture trowser below, and the men themselves trudging in the mud among unsympathetic bystanders. The grooms of a well-appointed circus tread the streets with a better presence.

In the midst of this city of mingled new and old, this ancient fossil, like a mediæval Italian town, perched on its heights, confronting the modern buildings of gentility, the citizens who move about are not, Mr. Stevenson thinks, sufficiently romantic. They do not dress or look the part. "To see them thronging by in their neat clothes and conscious moral rectitude, and with a little air of possession that verges on the absurd, is not the least striking feature of the place." At this sentence it seems the natives of Glasgow rejoice, for the inhabitants of the two chief Scotch towns are a jealous race. The Edinburgh people had their victory in the return match, when Mr. Matthew Arnold touched in a popular lecture on civilization as it exists in Glasgow.

The Old Town is, of course, the part of Edinburgh that it is most pleasant and easy to describe. Mr. Stevenson, with a sudden awakening of local patriotism, is almost angry with men who say "the old is better." He thinks it is the contrast of ancient and modern that makes the charm; "the two react in a picturesque sense, and the one is the making of the other." This is all very well; but the New Town by itself would find few admirers. It would be like the "Telemachiad" of learned German fancy, deprived of the rest of the Odyssey. The Old Town has been written about by poets, novelists, and sanitary reformers; but Mr. Stevenson finds something fresh to say, something new, personal, and effective:—

One night I went along the Cowgate after every one was a-bed but the policeman, and stopped by hazard before a tall *land*. The moon touched upon its chimneys, and shone blankly on the upper windows; there was no light anywhere in the great bulk of building; but as I stood there it seemed to me that I could hear quite a body of quiet sounds from the interior; doubtless there were many clocks ticking, and people snoring on their backs. And thus, as I fancied, the dense life within made itself faintly audible in my ears, family after family contributing its quota to the general hum, and the whole pile beating in tune to its timepieces, like a great disordered heart. Perhaps it was little more than a fancy altogether, but it was strangely impressive at the time, and gave me an imaginative measure of the disproportion between the quantity of living flesh and the trifling walls that separated and contained it.

To this Old Town, up that steep "Mound," drift "all disastrous things," all the ruined strays of the life of the new city. It runs uphill, the slope of this social Avernus, but the ascent is easy. In a city so tiny as Edinburgh, as in towns of the size of Nottingham and Lincoln, every one knows his neighbours by sight. Mr. Stevenson describes the gradual worsening of a man's face and dress, his disappearance from prosperous Princes Street and George Street, his appearance in the "closes" of the Old Town to which he flees "like a wounded animal to the woods." To the Old Town belongs

* *Edinburgh: Picturesque Notes.* By Robert Louis Stevenson. With Etchings by A. Brunet-Debaines; Vignettes, &c. London: Seeley, Jackson, & Halliday. 1879.

the Parliament House, a woful place, which Mr. Stevenson describes, as it seems to us, with cruel realism:—

A pair of swing doors gives admittance to a hall with a carved roof, hung with legal portraits, adorned with legal statuary, lighted by windows of painted glass, and warmed by three vast fires. This is the *Salle des pas perdus* of the Scottish Bar. Here, by a ferocious custom, idle youths must promenade from ten till two. From end to end, singly or in pairs or trios, the gowns and wigs go back and forward. Through a hum of talk and footfalls, the piping tones of a Macer announce a fresh cause and call upon the names of those concerned. Intelligent men have been walking here daily for ten or twenty years without a rag of business or a shilling of reward. In process of time, they may perhaps be made the Sheriff-Substitute and Fountain of Justice at Lerwick or Tobermory. There is nothing required, you would say, but a little patience and a taste for exercise and bad air. To breathe dust and bombazine, to feed the mind on cackling gossip, to hear three parts of a case and drink a glass of sherry, to long with indescribable longings for the hour when a man may slip out of his travesty and devote himself to golf for the rest of the afternoon, and to do this day by day and year after year, may seem so small a thing to the inexperienced! But those who have made the experiment are of a different way of thinking, and count it the most arduous form of idleness.

Edinburgh is one of the last places where legends linger. Legends really seem to exist only in novels where every ancient castle has its ghost, and not only its ghost, but what is far more rare, its old man who knows the story of the spectre. Peasants have become too stupid, or too highly educated, too shy, or too uninterested, to remember and relate the traditions of their birth-places. In towns modern men live, not as in an abiding city, but as sojourners; respectable Arabs who are constantly shifting their goods and pitching, if they prosper, in a more fashionable square; if they are unfortunate, in a more squalid court. Their houses are not family houses; generations of people of the same blood have not lived and died in them, and peopled them with shadowy memories. The streets are all too uniform, the identity changes with each change in the number, and an intelligent ghost would find it necessary to leave his old house, when the Local Board shifts the ciphers, as the Northumbrian Brownie followed the farmer's flitting. In Edinburgh people perhaps move about less; at all events the baronial houses of the Old Town stand out bravely against time and sanitary reform. These "lands" are peopled with legends; Mr. Stevenson quotes a few of those which are still most commonly told to Edinburgh children. "The fame of Deacon Brodie is kept piously fresh"—Deacon Brodie who was a prosperous tradesman, and an accomplished burglar. The story of his misdeeds is likely to be a favourite one with children who hear it early, and who feel, ever after, with secret joy, that the carpenter may be a cracksman in disguise, the chimney-sweep a brigand (he looks like one), and the man who tunes the piano the chief of a gang of malefactors. The legend of Major Weir has, we think, been rather spoiled by a modern touch. It is hard to believe that "the devil's coach, drawn by six coal black steeds with fiery eyes, would drive at night into the West Bow." This is a nursery touch, and the Major, with many other malefactors, is better to read about in those dark records, the reports of old Scotch criminal trials. There, we presume, may be found the dreadful story of the murder of Johnston of Warristoun, a dreary house on the outskirts of Edinburgh, standing above a deep and dismal tarn, as stood the unhappy mansion in the *Fall of the House of Usher*. Johnston of Warristoun was the husband of a young wife, whom he so cruelly maltreated, to the extent of biting her arm, that in despair she sent her old nurse with a bag of money to the Canongate to speak secretly with a man who had been her father's servant. This man was brought furtively into the house, and concealed in the cellar, the lady of Warristoun knowing well what business he had on hand, and what was to be the end of her lord's supper on that night. The wretched husband seems to have drunk freely, while the wife sat alone, not fearing his ruffianly violence as usual, but listening for something worse than his brutal shouts. Presently the dreaded sound came, the shrieks and screams of the domestic tyrant as the old serving-man strangled him with his hands. The wretched wife could not endure to hear this horrible noise, and even when the screams were silent they rang so loudly in her ears that she gave herself up to justice, which for once was comparatively merciful, and put her to death with no superfluous torture. In place of this story, the Scotch counterpart of the legend of the Cenci, with a vile husband instead of a vile father, Mr. Stevenson tells the legend of the Two Sisters:—

This pair inhabited a single room; from the facts, it must have been double-bedded; and it may have been of some dimensions: but when all is said, it was a single room. Here our two spinsters fell out—on some point of controversial divinity belike: but fell out so bitterly that there was never a word spoken between them, black or white, from that day forward. You would have thought they would separate: but no; whether from lack of means, or the Scottish fear of scandal, they continued to keep house together where they were. A chalk line drawn upon the floor separated their two domains; it bisected the doorway and the fireplace, so that each could go out and in, and do her cooking, without violating the territory of the other. So, for years, they coexisted in a hateful silence; their meals, their ablutions, their friendly visitors, exposed to an unfriendly scrutiny; and at night, in the dark watches, each could hear the breathing of her enemy. Never did four walls look down upon an uglier spectacle than these sisters rivalling in unsisterliness. Here is a canvas for Hawthorne to have turned into a cabinet picture—he had a Puritanic vein, which would have fitted him to treat this Puritanic horror; he could have shown them to us in their sicknesses and at their hideous twin devotions, thumbing a pair of great Bibles, or praying aloud for each other's penitence with marrowy emphasis; now each, with kilted petticoat, at her own corner of the fire on some tempestuous evening; now sitting each at her window, looking out upon the summer landscape sloping far below them towards the firth, and the field-paths where they had wandered hand in hand; or, as age and infirmity grew upon them and prolonged their toilettes, and their hands began to tremble and their heads to nod involuntarily, growing only the more steeled in enmity with years; until one fine day, at a word, a look, a visit, or the approach of death, their hearts would melt and the chalk boundary be overstepped for ever.

Mr. Stevenson thinks these unloving sisters a type of the sectarian spirit in Scotland. Perhaps a more hopeful critic would hold that, though the "chalk lines" still exist and separate "the Churches," the spirit of hatred is dying rapidly. Giant Bigotry *a son tans trespassé*, as the old French novel says; he has seen his best days, he has lost his best teeth, and only mumbles "damnatory prayers" now and then on Sundays.

Mr. Stevenson's later chapters are notes on the Pentland Hills, those delectable mountains so fortunately near the town; on the little villages round which Edinburgh has grown without destroying them; on the Scottish custom of drinking in the New Year. "A Scot of poetic temperament, and without religious exaltation (we should have said 'with or without'), drops, as if by nature, into the public-house. The picture may not be pleasing, but what else is a man to do in this dog's weather?" What else, indeed, unless he drops into his club and plays whist! Fergusson, the Edinburgh poet—whose name, Mr. Stevenson thinks, the votaries of Burns keep rather dark—has stated in half-a-dozen lines the old theory in life in Edinburgh:—

When big as burns the gutters rin,
If ye hae caught a drookit skin,
To Luckie Middlemass' loup in,
There sit fu' snug,
O'er oysters, and a dram o' gin,
And haddock lug!

We quote from memory, but the last line must be right, because it is so meaningless. No one could invent "haddock lug."

Our quotations from Mr. Stevenson's notes make it needless to say anything about his style. It speaks for itself; it is captivating and irritating; it keeps the attention awake; it sketches a picture; in two words, it is never commonplace; it retains an accent of the quaintness of a time of leisure.

The etchings by M. Brunet-Debaines, from drawings by Messrs. Lockhart and Bough, are of less equal merit than the humble woodcuts. The view of Edinburgh from the Calton Hill, the sketch of Grey Friars Churchyard, and the delightful picture of a "close" in the Old Town, are, we think, decidedly the best of the illustrations. The "Queen's Entry into Edinburgh" is clever, but not clever enough to supply the interest in which the subject is deficient. Mr. Stevenson has unkindly left the artist to cope unaided with this incident in the history of modern Scotland.

RICHARD BRATHWAITE.*

MR. ROBERTS is an enthusiast of a kind rare in England, an enthusiast for the production of finely-printed books. It would not seem to have much antecedent probability that the place where these volumes of Brathwaite, and the Apophthegmes of Erasmus, and Mr. Pickering's lately-published Coleridge should see the light would be the Strait Bargate in Boston, the narrow street of the dull Lincolnshire town whose existence seems to be summed up in two things, its church and its corn-wharves. But there is no law in these matters, and nothing appears to prevent good things from coming out of Boston. The question that such books as these suggest, after one's admiration for type and paper has cooled down, is the question whether they are intrinsically valuable enough to reprint. Fashion has its follies as certainly in the domain of books as elsewhere, and it is inevitable that in an antiquarian age like the present much literary rubbish will be raked out from the lumber-heaps of the past that would better have been allowed to lie still. Publishers themselves feel this keenly when it begins to be borne in upon them—as it has lately been both in London and in Paris—that they have overstocked the market, and that the demand for old rhymers and playwrights has its limits. Editors are less open to conviction, and it is for the critics to remind them of what has lately been so well said by Mr. Stephen, in his paper on Landor, that the natural selection of time is for the most part to be trusted; that what survives *vi propria* is generally what ought to survive, and that it is a proceeding of doubtful wisdom to try to resuscitate the dead. Of course there is no hard and fast line to be drawn. An immense boon was conferred on English letters and on the English mind when Lamb and Coleridge and a few hard workers of less genius set themselves, at the beginning of this century, to revive the fame of the Elizabethans. The "Romantic" fever in France after 1830 both recalled into existence many great but forgotten names—such as Louise Labé and Jean Schelandre—but set new ideals before the actual generation which none can deny it did well to follow. If it were merely an affair of the reader's pleasure, perhaps nothing should be said against the practice of revivals and reproductions. With Lamb's *Old Dramatists* and kindred volumes in one's mind, it might seem ungracious to refuse any new gifts which the patience of the antiquaries may bestow on us. But there is nowadays no danger that a cool reception of one reprint will make another, if a really valuable one, less likely to be made. All

* *A Strappado for the Divell.* By Richard Brathwaite. With an Introduction by the Rev. J. W. Ebsworth, M.A. Boston (Lincolnshire): Robert Roberts. 1878.
Nature's Embassie, Divine and Morall Satyres, &c. By Richard Brathwaite. Boston: Roberts. 1877.

that we demand, in the interests of a literature which is every day becoming more overwhelming in its mass, is that no poet should be reprinted who has not either some real poetical merit, or some light to throw upon the history or the social features of his time.

If it is asked whether Brathwaite satisfies either of these tests, a calm criticism must pronounce that he scarcely does so. Mr. Ebsworth, who writes a rather overstrained introduction to the present edition of the *Strappado*, sees in Brathwaite "an illustrator of rural customs and of transitory habits in the busy city-life"; a writer indispensable to our study of the Jacobean drama; a humourist, a poet, "a bold and genial Englishman"; and then protests that he has given Brathwaite "not a tenth part of his due." A reader less committed to the theory that everything old must be good would probably confess that he found in these volumes singularly little help to the understanding of the time; that Brathwaite's moralizing poetry was poor and commonplace, not to be compared with that of many of his contemporaries; that his satire was too involved to be pungent, and his pastorals both coarse and tedious. His worst vice is long-windedness, as might be guessed from an inspection of the titles of his works given in the well-constructed memoir that is prefixed to *Nature's Embassie*. The editor counts thirty-seven of his publications—all, or almost all, issued with the absurdly emblematic and roundabout titles in fashion during the seventeenth century—the subjects varying from *Art asleep Husband? a Boulster Lecture* to *A collection of the chiefe of the Ancient Heretikes*. Indeed, his mind was a farrago; and he did nothing that was not miscellaneous. There is as little unity in the *Strappado* as in the list of Brathwaite's works as a whole.

The "discoverer" of Brathwaite was that careful student Joseph Haslewood, who edited the anonymous and, till then, wrongly attributed *Barnabæ Itinerarium* in 1818, and re-edited it in a more perfect form for subscribers in 1820. "Of his life and works," says the editor of *Nature's Embassie*, "all that it is now desirable or possible to know has been told by Haslewood with such copiousness of detail, that the writer of any new matter has rather to sift and winnow what has been already gathered and gleaned than to glean anything new of his own." It all comes to very little—namely, that Brathwaite was of a good Northern family; that he lived from about 1588 to 1673; that, after an education at Oriel College and a short time in London, he retired to the North, was twice married, lived at Burneshead or Burneside near Kendal, and at Catterick; that he was "a subject sworn to loyalty," and suffered in purse from the exactions of both sides during the civil wars; and that he published nearly forty volumes of verse and prose, satirical, historical, didactic, descriptive, and religious, of which the best-known volumes are the two before us and the famous "Barnabee's Journal." Of those which we are now noticing the *Strappado* is the earlier in date, having been published in 1615, when the author was about twenty-seven years of age; the other—which, as Mr. Ebsworth says, may well be regarded as a continuation of it—having appeared six years later. The titles reveal even less than usual of the contents of the volumes, which, as we have said, are of the most miscellaneous kind. What Brathwaite seems to have meant by "the Devill" is, not Detraction (which in this volume is not "lashed" at all) but evil in general—the literary crimes of the poetasters, the blandishments of the courtesan, the fawning of the courtier, the hypocrisy of the Puritan, the secret vices of the great, the cruelty of the landlord, the insubordination of the tenant. Again, *Nature's Embassie* denotes the message sent by Nature "to this Age for her Reformation"—by Nature before she was degenerate and "adorned with unnaturalized ornaments, which nature never apparelled her with":—

> Doth not thy habite shew thy wanton mind,
> Forward to all things but to vertuous life;
> Passing those bounds which Nature hath assign'd,
> 'Twixt Art and Nature by commencing strife?
> I tell thee, Nature sends me to represse
> Thy foolish toyes, thy inbred wantonnesse.

It is strange to find a Jacobean Englishman thus anticipating Jean Jacques. But when Brathwaite had got his idea, he could not work it out; or rather he seems to have first versified the commonplaces which make up his "twelve satyres," and then to have cast about for an idea with which to label them and give them a kind of factitious unity. Pleasure, Ambition, Vainglorie, Crueltie, &c., are each of them attacked; but little use is made of the formula of "Nature," and the satires are mere sermons in verse, with historical examples to serve as text. Brathwaite was too heedless and rapid a writer to care for the rules of art. Of the satires themselves it is curious to note how much the best are those in which the writer has real examples before his eyes or a pointed story to tell. Clytemnestra, Tereus, and Polynices are chronicled in the dreariest fashion: but it is a different thing when we come to Hypocrisie and Brathwaite's pet aversion, the Puritan:—

> Claudius is pure, abjuring prophane things,
> Nor will he companie with wickednesse;
> He hates the source whence lewd affection springs,
> He'll not consent with deeds of naughtinesse;
> Yet he will deale, so none do see his sinne,
> Yea though heavens eyes he cares not looke on him.
>
> He will not speake unto a maid in th' streete,
> Lest his repute should fall into decay;
> Yet if they two in private chance to meete
> He in a pure embrace will bid her stay,
> Saying: I will instruct thee prettie Nan,
> How thou shalt be a formal Puritan.

And so on, in lines of which the vigour is evidently the fruit of strong feeling. The other vice which moves him (we must remember that his hospitality nearly ruined him) is Miserie, *i.e.* Miserliness. Taurus in *Nature's Embassie* and the reclaimed miser in the *Strappado* (pp. 35, *sqq.*) are an excellent pair; and there is force in the lines which draw the miser's portrait:—

> Here shalt thou see th' picture of Avarice,
> Thin-check'd, raw-bon'd, faint-breath and hollow-eyes,
> Nose-dropping, rhewme-destilling, driveling mouth,
> Hand-shaking, haire down-falling, th' miser's cough,
> Legs goutie, knees unweldy, hand on cruch,
> Eyes in his bosome, gasing on his pouch,
> His labour torment, rest he cannot take,
> When all are sleeping, he is forc't to wake;
> His eyes are ever ope, for riches keepe
> His eyes unclosed; the miser cannot sleepe.

Each of these volumes contains a varied collection of Brathwaite's different styles; each in fact is made up of two separate volumes, the slow sale of some of the author's works at their first appearance having made the original publisher bind up old with new. *Nature's Embassie* comes out enlivened with a set of *Shepheardes Tales*; the *Strappado* with *Love's Labyrinth*, one of many versions of the tale of Pyramus and Thisbe. Thus any one who wishes to understand Brathwaite need go no further than these books; and indeed we venture to hope that Mr. Ebsworth was saying what he wished rather than what he intended when he wrote, "The first duty now is to reprint Brathwaite's various works with scrupulous fidelity." Surely these two, with Mr. Hazlitt's re-issue of Haslewood's edition of *Barnabee*, are enough. A writer who exercised no restraint on himself, who "never blotted a line," when there was so much to blot, must suffer the natural action of time, and eager editors must be sparing in their attempts to reverse it. One of Brathwaite's best poems, and one that really could not be spared on account of its references to his contemporaries, Wither, Browne, Ben Jonson, and others, is his *Epistle to the Poetasters of Brittaine*. We will leave him with a quotation from it, not without its application to himself:—

> Many we have here
> That can compose their Verse, but in a sphere
> So different to the time, as they descry
> Their want of braines to each judicious eye.
> Yea some I know are Poets in this time
> Who write of swains, might write as well of swine,
> For th' profit of their labours is so small
> As 'twere far better not to write at all,
> Then to consume such pretious time in vaine,
> About a fruitlesse and desertlesse straine.

There is something in his work that is worth preserving, but he was entirely free from self-criticism, and hence the value of his writing is indefinitely less than it might have been.

WITHERED LEAVES.*

IT is no easy matter to judge of the merits of a novel when we read it in a translation. The plot of the story and the incidents of course remain the same, but the style is changed, and in almost every case is changed for the worst. The plot may be absurd, the incidents may be extravagant, and yet the author may so please us by his style that we scarcely detect either the absurdity or the extravagance. It is a pleasing style, moreover, that most reconciles us to length of narrative. Charmed by it we forget to notice how many pages there are to each volume, and how many volumes to the whole book. It is very likely, for instance, that any one who should read this story of *Withered Leaves* in the German would not be overcome with dismay, as we were very soon overcome, by the intolerable length to which it is dragged out. That which in the translation seemed to us heavy and tedious might, as it was told by the author, have appeared light and lively. Most certainly, whatever charm there may be in Herr Rudolf von Gottschall's compositions, there is not even a trace of it left in the version of his story that is now before us. We have before this drawn attention to the courage, we might say the audacity, that foreigners—Germans above all—are so constantly showing in translating books into English. Surely, if they are willing to undertake the useful drudgery of translating, it is in their own language, and not in ours, that they should write. It is not from his own language, but into his own language, that each writer should translate. The most convenient arrangement, no doubt, would be for translators to work in couples. Perhaps the best version which this age has seen is *The Story of Grettir;* and here Mr. William Morris, though he is no mean Icelandic scholar, worked with Mr. Magnusson; and, we may add, Mr. Magnusson, though he is no mean English scholar, worked with Mr. Morris. It might be objected, and we fear with some reason, that at present so much indifference is clearly shown by our novel-readers to elegance, or even correctness of style, that it matters very little in what kind of language the tale is told, provided that the plot be exciting, the incidents startling, and the characters unnatural. It might also be said that there are certain tricks of language in which novelists delight which can be picked up with the greatest ease by the translator. Miss Bertha Ness, for instance, in this version of *Withered Leaves*, as we shall presently show, has evidently made a careful and a successful study of some of our worst writers. But these pleas are not of much avail. In the first place, we are naturally inclined to be indulgent towards our own countrymen—countrywomen we should more properly say—and to allow them to make themselves absurd where we should show no tolerance

---

* *Withered Leaves.* A Novel. By Rudolf von Gottschall. From the German, by Bertha Ness. 3 vols. London: Remington & Co. 1879.

towards a foreigner. In the second place, with all their faults, they are free from that stiffness of composition which is the mark of any one writing in a foreign language, and which, carried on through three long volumes, becomes intolerably wearisome. Translators—at all events, translators of novels—would do well not to be over-conscientious. They should remember that they have first of all to produce a work that shall be readable; and, should they happen to come across a sentence which they cannot successfully render, they had better pass it over.

Withered Leaves, for instance, opens with a description of a moonlight scene on the southern shores of the Baltic Sea. The author plunges at once into what we may well call poetical prose, than which we know few kinds of writing that are more difficult to translate. There is some satisfaction, however, in the thought that, even in the original, it is generally worth very little. But whatever may be the value of Herr Rudolf von Gottschall's description, surely Miss Ness would have done better had she cut it down to the brevity of the stage directions in a play-book. "Moonlight and Starlight Scene on the Baltic" would have brought the place far more clearly before the reader than such a sentence as the following:—"The primordiate blocks of granite which kept watch at the estuary of the streamlet gained a venerable appearance in the light of the planets." This is not even novelists' English. Miss Braddon would disown it. We are rather better pleased with the translator where, on the sixth line of the book, she writes that, "here and there quivered a ray of the woodland stream." Here is a proof of that diligent study of the style of our worst writers for which we have already praised her. So, too, we must praise her when she makes eyes and precious stones scintillate instead of sparkle, and when she writes of the shimmer of a summer dress, and the flashing shimmer of a piece of gold, and red shimmering flowers, and a Southern shimmer, and shimmering structure of clouds. She is not quite so successful when she comes to that shivering in which modern novelists delight. Heroes and heroines very commonly shiver, but they do not, at all events in England, shiver uncomfortably. Still less do they cough annoyedly. We have less fault to find with her when she represents a man as looking at the caligraphy of the addresses of some letters. All that she means to say is that he looked at the handwriting in order to see from whom the letters came. But, though caligraphy does not mean handwriting, yet it comes sufficiently near it to more than justify a novelist in giving it that preference which so properly belongs to it as being derived from the Greek. We must not be too critical moreover when we find an architect described as being talented. Talented is not, to be sure, English, but the number of English writers who know this is growing less and less. We must protest, however, when we are told that the charm of nature presciently awakes gloomy feelings in the heart, and when we read that Eva pressed herself deprecatingly against her mother, whose gigantic form towered above the slender girl. Any one would imagine that Eva's mother, who was quietly enjoying the moonlight scene, was some giantess travelling in a show, who was allowed out only after dark when she could not be noticed. She was merely "a fine woman," according to the description given of her. What, we may next ask, is a newspaper's crevice? We read of "the most unfavourable critic, the most venomous monster that lurks in any newspaper's crevice." Scarcely less are we perplexed when we read that "Eva felt as in a dream where, wandering through subterranean passages, one door is shut noisily after another, and the sneck closes clatteringly." If we might venture to give translators a hint, we would advise them to follow a method which we found years ago in our college days to be very advantageous in writing our exercises. The venerable tutor who examined our translations looked only at the Latin, and troubled himself very little about the English of which it professed to be a translation. Were we puzzled by some sentence in Addison which we could in no wise twist into Latin, we passed it over, and, drawing on our memory, filled up the gap with a few lines out of Cicero. The result generally was no small praise for the excellence of that one sentence. Surely it would be better in like manner to bring in a paragraph even from Miss Braddon than to write such a sentence as the following:—"In spite of this cooling element, he was obliged to wipe the perspiration from his forehead, because it was a toilsome labour to obtain an equal temperature of disposition in all the coadjutors, and similarity of views about the pieces of music to be performed." There are one or two other passages which we have noted for the oddness of the writing. The hero, who was taking a friend to see his breed of sheep, is said to have "showed this living inventory not without contented pride." The billows of the sea surged uneasily; a man addressed a warm speech to another. A driver would not be deprived of guiding the foaming team. Intoxicated idealism lent a poet most infectious enthusiasm. This poet and the hero were in love with the same girl, but when the hero looked more closely at his rival he did not displease him at all.

Readers, however, who are indifferent to style provided only that they can get excitement, will certainly find in this story a great variety of incidents. The hero, Herr von Blanden, a Prussian noble, at the beginning of the story falls in love with Eva, a charming young lady, who was brought up by her aunt, the giantess, who had adopted her. On the night of the betrothal he meets her mother, and discovers in her a woman who years before, when they both belonged to the same peculiar religious community, had by a decision in council of the Superiors been destined for his spiritual bride. The match is at once broken off, and Eva goes out in a boat with a half-crazed girl, and drowns herself. She leaves behind a paper on which she had written, "I do not desire to live any longer—love my mother." Even had the hero been able thus to transfer his affections, it was not in this case possible, for the mother also died. Here we have quite early in the second volume a hero left without a heroine. The half-crazed girl, indeed, was in love with him, but as she could not speak, or at best could only say a few words, she was by no means well fitted for taking Eva's place. Some years earlier in the story, Blanden had fallen in love with a celebrated Italian opera-singer, Giulia Bellini. He had lost sight of her, but she had never forgotten him. Her husband is the villain of the story, and as good a villain as one could desire. He moves about in disguise, and with a stealthy step, and always turns up when he is least looked for. He had behaved to his wife with the greatest cruelty and plundered her of her earnings. He had been, as she discovered after marriage, a convict, and bore the prison brand on his shoulder. He was a gambler, a *croupier* at Monaco, a Russian smuggler, and, in fact, was one of those dreadful ruffians who can never get killed off till the last chapter but one of a novel. She had long lived apart from him, though he still preyed upon her and plundered her of her earnings. Blanden, who had no suspicion that she had a husband living, on meeting her a second time proposed to marry her. She refused, but he fought a duel for her sake and got shot in the chest. She nursed him through his illness, and at last consented to be his wife. The villain discovered an ancient secret passage into Blanden's castle, and coming through it into the room of the newly-married lady, who was the wife of both of them, surprised her at her toilet, and robbed her of some of the finest of the jewels that her new husband had just given her. He then disappears. Then the half-crazed girl comes also into the secret passage, sets fire to the castle, and nearly burns the newly-married people to death. The villain soon after gets shot in a smuggling fray, but lives long enough to tell Blanden how he has been deceived in his wife. She, hearing of this, disappears. Blanden can learn nothing of her. Next the Sleswick-Holstein war breaks out. Blanden gets again shot, this time in his leg. Giulia suddenly appears on the field of battle, and a second time nurses him. He forgives her, and she comes back to him as a wife. He sells all his estates in Prussia and starts with her "into the kingdom of Buddha, into the dream-world of the East." Such exciting scenes as these, combined with not a little by-play in love-making on the part of the minor characters, ought surely to cover, in the eyes of all novel-readers, even greater faults on the part of the translator than those which we have had to point out.

CHURCH'S STORIES FROM VIRGIL.*

A SUPERFICIAL reader might imagine that it was a far easier task to construct a series of stories on the basis of Virgil's epic than to translate the Æneid into English verse; yet a careful perusal of this new work of Mr. Church's might correct such a misconception. There are so many qualifications—thorough appreciation of phraseology, nice insight into the poet's mind, and just perception of the dignity required for the adequate expression of his drift and meaning—in the absence of any one of which the attempt would be a failure, that it were quite a mistake to suppose the office of a Virgilian storyteller could be safely ventured on by an ordinary *raconteur*, or even that it was one in which success was guaranteed by a previous success in dealing with the Iliad. Homer may be the grander poet of the two, but his far-away imitator has the more subtle art, which it is as much the storyteller's function as the translator's to perceive and represent, and which, if he understands his business, he may even treat with more effect. Our readers may be presumed to have read and enjoyed Mr. Church's admirable *Stories from Homer*, and are therefore aware that in the construction of them, as in his parallel work on Virgil, he relies wholly on his text, without a vestige of note or comment, to tell a tale which is intensely skilful and full of delicate artistic touches. We promised some weeks ago a fuller notice of the *Stories from Virgil* than they could receive amongst a group of Christmas books, though amongst these, by the way, they claim a high place; and it may not be inopportune to examine the evidences of aptitude for his task, constructive skill, and conservative fidelity to his model, which, though Mr. Church distinctly renounces the pretensions of a translator, these "Stories" nevertheless present. Although in his preface he frankly pleads guilty to sins of omission, we must say that his practice scarcely bears out his admission, unless indeed it be in the case of the fine rhetorical outbursts in the speeches of the Fourth Book; and yet even here, if it does seem that Dido's frenzied utterances to Æneas as well as his rejoinders are somewhat curtly rendered, it may justly be pleaded that there was an object in husbanding space to give full effect to the Queen's funeral speech, and the terrific curse which she therein launches at the head of the truant hero. At any rate, he is careful to represent adequately his author's personification of Rumour, "a marvellous creature, moving very swiftly, with feet and wings, and having many feathers upon her, and under every feather an eye and a tongue and a mouth and an ear; and she loveth that which is false, even as she loveth that which is true"; whilst, further on, in illus-

* *Stories from Virgil.* With Twenty-four Illustrations from Pinelli's Designs. By the Rev. A. J. Church, M.A., Head-Master of King Edward's School, Retford. London. Seeley, Jackson, & Halliday. 1879.

tration of Rumour's mendacity, he judiciously blends in a sentence of direct narrative the speech which in the original Dido's despised suitor Iarbas is made to address to Jupiter, with Rumour's whisperings in his ear. Comparing Æn. IV. 189-196 with the lines 215-217—

> Et nunc ille Paris cum semiviro comitatu
> Mæonia mentum mitra crinemque madentem
> Subnexus rapto potitur—

we could not desire a more efficient yet succinct representation of the gist of the whole than Mr. Church's paragraph, which is as follows:—"And Iarbas was very wroth when he heard it, and coming to the temple of Jupiter, spread his grief before the God, how that he had given place on his coasts to this Dido, and would have taken her to wife but that she had married a stranger from Phrygia, another Paris, whose dress and adornments were of a woman rather than of a man." We may note, too, the minute care with which our storyteller keeps his threads in hand where, as in this story of "Dido's Love and Death," he preserves the trait of her fond remembrance of her lost Sichæus when as yet only tempted by the charms of the Trojan hero, and her resolution so soon to be broken:—

> Ille meos, primus qui me sibi junxit, amores
> Abstulit: ille habeat secum servetque sepulchro.

"The Husband of my youth hath carried with him my love, and he shall keep it in his grave." Nor does he forget, in his description, in chapter xiv., of the "Dwellings of the Dead," and in his selection of the personages there met by Æneas, to represent the poet's delicate recognition of this first love revived in the shades below, for, after indignant repulse of the faithless adventurer's rather lame apologies, Dido's shade retreats—

> In nemus umbriferum; conjux ubi pristinus illi
> Respondet curis, æquatque Sichæus amorem.

As Mr. Church's story runs:—"She departed into a grove that was hard by, wherein was her first husband, Sichæus, *who loved her even as he was loved.*"

We observe a like scrupulous fidelity in the striking passages which set out the utterance and fulfilment of the Harpies' prophecy in the Third Book and elsewhere. A less vigilant storyteller might have got himself into difficulties by omitting, say, the incident of the inroad of the Harpies on the Trojans' meal on one of the Strophades isles, and then finding himself a defaulter when he came to summarize Helenus's counsel to Æneas in the fifth chapter, and met allusions to which his antecedent account contained no reference. Here, however, we have, in the first instance, both the graphic incident and the troublous prophecy of Celæno; in due sequence, a hint of a softening of the burden of the prediction in the cheering words of the Seer, whose kindly disposition towards the wandering Trojans Æneas realized in the "recidiva Pergama" which he saw in the now kindred realm of Epirus, "where all things were ordered and named even as they had been at Troy—only the things there had been great, and these were very small"; and, further on, when the wanderers reached the land of Italy and Latinus, a full detail of the harmless issue, where "it so chanced that Æneas and Iulus his son and others of the princes sat down to eat under a tree, and they had platters of dough whereon to eat their meat. And, when they had ended and were not satisfied, they ate their platters also, not thinking what they did. Then said Iulus in sport, 'What! do we eat even our *tables?*' And Æneas was right glad to hear that thing, and embraced the boy and said, 'Now know I that we are come to the land which the Gods have promised to me and to my people that they would give us. For my father Anchises spake to me saying, "My son, when thou shalt come to a land that thou knowest not and hunger shall constrain thee to eat thy tables, then know that thou has found thee a home."'" Critics who have regarded the incident as beneath epic dignity might have some ground for their carping but that, as Conington notes, there is a fitness in the pleasantry which consists in a play of words anent *platters* and *tables* proceeding from the lips of the boy Ascanius.

Of no little help to the wide acceptance of these Stories will be the quaint bibliolatry of the dress in which they are conveyed, and which Mr. Matthew Arnold long ago discerned to be a fitting vehicle for translating Homer. It is certain that the adoption of the language of the Jacobean translators of the Bible, so dignified and yet so sweetly rhythmical, is the surest passport to the hearts of the majority, whether of scholarly or of lay readers, as being that with which they have been familiar from early years, and of which, we trust, no ill-advised changes are likely to rob them. Examples of this are not far to seek—as, *e.g.* where, in the Sack of Troy, when Hecuba dissuades the aged Priam from going forth to the fray, having girded on his armour, long laid aside, she addresses him in the words (II. 519, *seq.*):—

> Quæ mens tam dira, miserrime conjux,
> Impulit his cingi telis? aut quo ruis? inquit.
> Non tali auxilio, nec defensoribus istis
> Tempus eget: non si ipse meus nunc adforet Hector.

How welcome here is the reminiscence of our English version of the Psalms, which is suggested by the counterpart presentment of Mr. Church:—"What hath bewitched thee that thou girdest thyself with armour? *It is not thy sword that shall help us* this day; no, not though my own Hector were here, but rather the Gods and their altars." In like manner, in the story of the Third Book where Andromache tearfully welcomes long-parted friends and kinsfolk, her queries as to the young Ascanius—"Ecquid in antiquam virtutem animosque viriles Et Pater Æneas et avunculus excitat Hector?"—fall easily and naturally into such phraseology as, "And is he *stout and of a good courage*, as befits the son of Æneas and sister's son of Hector?" On all occasions, too, when Virgil's heroes or heroines invoke the Gods to visit men's good or evil deeds upon them, such scriptural phrases as "The Lord do so to thee and more also," and the like, are well brought in to match and represent the language of the original. It can scarcely be doubted that the introduction of such phrases as we have instanced tends to leaven the lump with a fitting element of dignity; and such is the pervading characteristic of the "Stories" in point of style. Mr. Church evidently feels that anything bordering on vulgarity, bathos, or even commonplace, would be alien to the genius of the original.

It is not uninstructive to observe how the storyteller's skill enables him to manipulate the Virgilian epic for his own purposes. Opening with the fine matter of the Second Book for his first three chapters, and making the Third Book the foundation of the next two, his sixth chapter carries the reader to the shipwreck which in Virgil occupies the First Book. The chapters about Carthage and Dido follow in narrative sequence and order of events; and in the tenth chapter we find ourselves occupied with the funeral games of Anchises, when the Trojans, in stress of weather in their hurried flight from Carthage, put into Sicily. When, after the visit to the Shades below, Æneas is at last landed in Italy and enters on a new scene of interest, "optato Thybridis alveo Securi pelagi atque mei," Mr. Church luxuriates, though temperately and discreetly, in a variety of pictorial effects, amidst which we commend especially the spirit and effectiveness of the *casus belli* in the slaughter of Silvia's pet stag (Æn. VII. 480 *seq.*) and the consequent gathering of the Italian chiefs. No noteworthy feature of Virgil's enumeration is passed over, and the seventeenth chapter closes with a lively glimpse of the Volscian Camilla—"A mighty runner was she, for she would run over the harvest-field nor harm the corn, and when she sped across the waves of the sea she wetted not her foot therein." In the next chapter (King Evander) the archæologic details, after the account of the slaughter of Cacus, about Argiletum, the Lupercal, and so forth, from the Eighth Book, are wisely retrenched; whilst in that about the Arms of Æneas our author skilfully pieces from different parts of the Eighth Book a description of the Artificer's forge at Lipari and a sketch of the shield made for Æneas at Venus's instance, which enables him to introduce, as from the compartments of the shield, the tableaux of old Rome as they presented themselves to the Augustan bard, A graphic sketch of the battle of Actium is a chief feature here, as in Anchises's prevision of the future of his descendants, vouchsafed to his son in the dwellings of the dead, is the fine passage about Marcellus and his too-early lost emulator. The din of war and clash of arms in the later chapters are relieved by the episode of Nisus and Euryalus; and readers of an older generation, who remember what it was to pick out some sort of interest in their Virgil with much help of dictionary and grammar, will envy the fortunate youths who live in a time when scholars have devised this happy method of making the poet popular and familiar. Verily, the suffrages of those to whom the Æneid is nowadays made easy ought to avail in finding Mr. Church a place where Virgil in his Sixth Book images those "holy priests and poets who had uttered nothing base and such as had found out witty inventions, or had done great good to men."

AMERICAN LITERATURE.

In no department of literature is American authorship more prolific or more lavish of labour, with apparent indifference to pecuniary return, than in the history of individual settlements or institutions with which the writer happens to be connected. The local patriotism of England is liberal enough of labour, and not merely of unremunerative labour, but of expense never likely to be repaid. But in England the local magnates with whom it is a duty incumbent on their rank and position to purchase, if not to read, such works, are numerous and wealthy, whereas in America this class of customers scarcely exists; and we can hardly suppose that elaborate records of the comparatively uninteresting fortunes of a town, a college, or a church find readers among a people who are generally busy, and most of whom are as indifferent to the story of strange institutions or distant places as they are enthusiastic about their own. Yet the volume before us (1), which contains not merely a narrative of all that has befallen Dartmouth College in New Hampshire, from its foundation to the present time, but memoirs of all its principal benefactors, presidents, and professors, and a great collection of papers which may be valuable in their way but are not exactly interesting to the general reader, filling 450 closely printed pages of the largest octavo size, is but one among hundreds of similar works. In every country there are not merely books, but whole classes of books, the motive of whose publication it is somewhat difficult to apprehend, as they certainly cannot bring profit to the publisher, and can hardly repay the author even in reputation, while they require that he should give much time and trouble to his task. It is easy to understand the existence of a numerous class of enthusiasts for special topics in countries like those of Western Europe, where there is a large

(1) *The History of Dartmouth College.* By Baxter Perry Smith. Boston: Houghton, Osgood, & Co. London: Trübner & Co. 1878.

…ly of well-educated men with means of their own and with no very urgent or absorbing occupation. But in America, where such a class is scarcely to be found, the great number of books of this kind is certainly creditable, as proving how many busy men are earnestly interested in one kind or another of more or less useless knowledge for its own sake. Mr. Smith must have spent no little time in collecting his materials; and if he has rather collected than adjusted them, and if some extra trouble on his part might have saved a great deal of wearisome work to his readers and perhaps enlarged their number, this fault should probably be attributed less to indolence than to the author's inability to understand how little his enthusiasm is shared even by those who have, like himself, a special interest in the College. Zeal for education distinguished the early settlers of New England from the very first almost as much as it distinguishes the entire American people at the present day. But education, especially secular education, was with the founder of Dartmouth College, as with many of his contemporaries, a secondary object. Even so late as in 1766, but a few years before the outbreak of the great revolutionary struggle, when colonial politics were becoming more and more exciting, when a national ambition was stirring in the breasts of a growing people, and when the single-minded religious fervour of earlier generations had given way to a more cool and practical temper, the spread of Christianity among the Indian tribes, as well as the maintenance of ancestral strictness of doctrine and life among the descendants of the Pilgrim Fathers, was a paramount object with numbers of estimable, earnest, and practical men. Of these, Eleazar Wheelock, the first founder of the College, deserves honourable mention. His original purpose was not to establish a new place of higher education for the rough, scattered, unlettered youth of New Hampshire, but to provide missionaries to the Indian tribes on the southern shores of the great lakes, many of whom still lingered in close proximity to the North-Eastern settlements. He considered that the best material for his purpose would be found in Indian youths taken at an early age, and trained to look forward to this as their appropriate career; and the original institution, which has grown into one of the best secondary colleges of New England, was both in name and in fact an Indian charity school. In this character it was that the infant College received liberal assistance from Lord Dartmouth and other Englishmen deeply interested in the progress of the rising English empire beyond the Atlantic. But, from the first, white scholars were willingly received; and even during the life of the founder the College gradually lost something of its exclusive and special character, a change which proceeded very rapidly under the direction of those who succeeded the founder and first President. The subsequent history of a second-rate college is matter of no great interest, the principal event in its annals being the ejection or enforced resignation of President Lord in 1863, on the ground that his views on the subject of slavery were inconsistent with the changed tone of opinion and feeling of the day—a step which savoured not a little of both religious and political persecution.

Mr. H. C. Lea has chosen an unfortunate title for a really valuable book. *Superstition and Force* (2) is a name that suggests the idea rather of theological controversy than of antiquarian study; and it is not under such a heading that the reader would look for an elaborate account of some of the most important forms of the ordeal, and of the various phases which the principle of an appeal to Divine interposition for the decision of human quarrels assumed in the development of mediæval jurisprudence. The work is much more thorough and careful than the majority of American researches into those recesses of the history of the so-called dark ages wherein lie the roots of most modern institutions, and wherein may be found the explanation of many curious survivals recently, or even now, embedded in modern law. The oldest form of the ordeal, or that which is plausibly regarded as such by the author, is one of which it is difficult at first to see the analogy to such extravagances as torture, the wager of battle, and the ordeal proper, or ecclesiastical; and, curiously enough, it is that which at first sight seems most akin to modern ideas, and which survives its younger rivals in the most cherished of English liberties—the principle of trial by jury. The so-called wager of law is probably as old as the Aryan migration into Europe; for in various phases and under different disguises it is found at once in the earliest law of Rome and in the primitive usages of the Teutonic forests and Scandinavian mountains. The practice of compurgation was probably in its origin a form of ordeal, an appeal by oath to the judgment or the vengeance of Heaven. The compurgators were neither witnesses nor jurymen. Their nearest analogue in modern jurisprudence is apparently the calling of witnesses to character. It was not pretended that they had themselves seen or known the event upon which the dispute turned and which their oaths were to decide. The rules regulating their selection in different cases exclude any such idea, and on these rules Mr. Lea has much information to give. In some countries at least it was expressly required that a certain proportion, generally a large majority, of the compurgators should, if possible, be kinsmen of the parties whose oath was to be confirmed by others; and probably at the root of the institution lay the idea that they appealed to the Powers who heard them to visit not merely the alleged offender, but his race, with their vengeance if the oath were false. It would be the duty of the clan to atone for the crime, if committed, or to give up the offender to the law; and by supporting him on oath they declared their conviction of his innocence, and their own consequent immunity. Between the wager of battle and the ordeal proper there was a contest as long and persistent as that between the Church and the feudal system. The wager of battle was of course a favourite privilege of free-born warriors, as afterwards of knights and nobles. The ordeal by ploughshare or hot iron, by water, cold or boiling, was under the control of the priesthood; and probably the shrewder members of the laity were not ignorant that the priests had means of deciding the issue at their pleasure. The gradual development and degeneracy of both forms of appeal to Heaven is worked out with much care and skill in the two essays which deal with the military and sacerdotal ordeals respectively. Torture was an inheritance of Roman law applicable under that law in its older form only to slaves. But as the power of princes and their tribunals increased, as the latter fell under the direction of the clergy, the only lettered class of the age, and as true faith in the direct interposition of Heaven in the judicial combat disappeared, torture was enforced even against nobles of high rank. This, the most cruel of all the methods by which jurisprudence attempted to supply the want of evidence or of judicial skill, survived the longest, and can scarcely be said even now to have entirely disappeared from the practice of nations which at least pretend to civilization.

Mr. Clark's work on European Turkey (3) is characterized by that strong prejudice which the unthinking American, whether educated or not, entertains against all European rulers and aristocracies, and in favour of all inferior or subject races and classes, whatever their origin, quality, and character, and however obvious may be their unfitness for any higher position than that which they actually occupy. As, however, many of those European writers who have a close personal acquaintance with the East display a marked bias in the opposite direction, the mere fact of partisanship cannot be taken to render this book undeserving of attention. An impartial estimate of facts is scarcely to be found in any recent publication upon this bitterly controverted topic; and it is only by balancing the statements of advocates against one another that untravelled Englishmen can form anything deserving the name of an opinion upon the state of things in the Levant and the future prospects of the country. Mr. Clark has at any rate the sense to see that a necessary preliminary to any intelligible estimate of the existing races in the East and their relations to one another is an account of the events which brought about those relations—the fall of the Lower Empire, the Turkish conquest, and the Greek revolution. That the story of the first and last could hardly be told in such a manner as to conceal the degeneracy of the self-styled descendants of the Hellenes the author has failed to perceive. Fortunately, when he enters into details bearing upon the comparative value and character of different sections of the subject population of Turkey, he is frank enough to make admissions which materially qualify his general statements.

The last series of *Boston Monday Lectures* (4) which we have received is remarkable for a curious inversion of the ordinary evolutionary theories of ethics. The lecturer takes many of the dogmas of materialism and one or two of the crudest ideas of comparative mythology, jumbles them up with some misconceived principles of physical science and some familiar metaphors, and constructs out of the whole a theory of conscience which has at least the merit of originality, if not of distinctness or plausibility. Not having fully grasped the truth that in physics there is no reality corresponding to the words "up" and "down," he devises a doctrine of moral gravitation according to which the metaphors drawn from physical weight and human gestures under moral influences are made the basis, not exactly of a materialistic explanation of ethics, but rather of a materialization of the spiritual theory. The doctrine is odd rather than interesting; and the illustrations rather than the argument have occasional attraction for a reader patient of the more grotesque forms of individual speculation.

Dr. Matthews's work on Oratory (5) is characteristically Amercan, both in its appreciation of the art and in that deficiency of acquaintance with its highest models which is common to French and American eloquence. A thorough study of Demosthenes is the remedy which nearly all scholars, and probably every English statesman and public speaker who has the good fortune to have read Demosthenes in the original, would recommend to the rising generation of both countries as a corrective of that glittering empty rhetoric which Americans as well as Frenchmen mistake for oratorical brilliancy. Fine phrases, tall talk, or "spread-eagleism," to use the terms in which American common sense satirizes American bombast, appear as thoroughly congenial to our practical kinsmen as to our volatile neighbours. This resemblance between the orators of two nations which have only this political characteristic in common, that both are passionately addicted to public declamation, and both very impressible thereby, but which in race, in temper, in hereditary training, and in historical antecedents

differ as widely as any two sections of the great Aryan family, might well be made the subject of a much more detailed examination than would here be in place. The lack of true classical scholarship which is certainly a notable feature of even the best American education, and which also characterizes the training of the better class of Frenchmen as compared with that of Englishmen and Germans, may have something to do with the matter, but more probably it may be traced to the common democratic institutions and ideas of the two countries. Democracy, whatever its other virtues, does not tend to raise the standard of taste, and has always as yet done more to corrupt the literary and oratorical ideas of the higher classes than to diffuse sound notions of good writing and correct speaking among the multitude. Dr. Matthews seems to have studied little oratory, save that which belongs to the common treasures of the English tongue; and his favourites among English speakers are men whose skill was shown in their influence over uneducated mobs and half-educated jurymen, or others whose most brilliant performances never made a real and deep impression upon Parliament or the public. These, as most resembling the masters of rhetoric in his own country, he most admires and best understands. That the purpose of oratory is persuasion, and that therefore the standard of excellence in speech must vary according to the character of the people to be persuaded; that the rhetoric which may suit an assembly of *sans-culottes*, or an untrained State Legislature in the West, would be a miserable failure in the House of Commons, or even in the Common Council of London; that the speaker who wishes to influence the most intelligent audience will, as a rule, use the plainest speech and the fewest ornaments—these are principles of which, like most writers upon rhetoric as an art, Dr. Matthews has a very imperfect idea. Of the great American speakers of the last generation, none would have ranked very high in the English Parliament, and perhaps the most successful within the bounds to which he chiefly confined himself as an advocate would have been the one least known to Englishmen, Rufus Choate. The choicest specimens of Webster's or Calhoun's eloquence would have been the least suited to the cultivated taste of English politicians. But, after all, Webster and Calhoun were men thoroughly in earnest, dealing with questions of vast practical and moral importance; and such men in their most earnest and passionate moods, addressing fellow-citizens who felt that their deepest interests were at stake, could not fail often to speak with a plain, simple lucidity which went home to the sense of their hearers, and would have gone home to that of Englishmen with equal directness. To young writers the advice has often been given to strike out all the sentences they most admire in their own productions; and in like manner an English speaker of the highest order, as, for example, Mr. Bright, would probably advise the pupils of Dr. Matthews and the admirers of his favourite orators to regard every choice specimen of Transatlantic eloquence as an example of the style most carefully to be avoided. The most interesting passages in this volume relate rather to the personal experiences than to the professional achievements of its heroes.

A much more practical ambition is that of the lady who undertakes to advise the youth of America how to read and what to read (6), to select for them the books on every subject best deserving their study. Unhappily the writer's knowledge of so wide a subject is limited, and limited in almost every department. It is perhaps enough to say that on the list of historical works of all ages recommended to her credulous pupils, Rollin, Figuier, and Sewell find prominent places; while Thucydides, Tacitus, Mommsen, and Grote, are unmentioned; that on questions of taste and criticism Margaret Fuller is coupled with Pope, and apparently preferred to Addison; while Mr. Bagehot and Alexander Smith are similarly ranked together.

Among the minor works of this month we have another modest manual on china-painting (7); and a key to the cookery-books (8), explaining, or intended to explain, those practical details which the latter take for granted, and which are generally the vital points on which the value of their recipes depends. Also, in the series of *Artist Biographies*, we have a Memoir of Fra Angelico (9) containing some interesting notes of his time and contemporaries. *On the Road to Riches* (10) is one of those books of practical advice which endeavour to give the young aspirant entering on life the benefits without the price of experience—an effort most benevolent and meritorious, but one which in the nature of things can very seldom succeed.

Among fictions, *The Leavenworth Case* (11), though marked here and there by signs of a lady's imperfect acquaintance even with criminal law, the simplest part of the science most perplexing to her sex, is exciting, and as good as the sensational style and purpose permit. It is preferable, we think, to five out of six of Miss Braddon's tales of murder and bigamy. *Play Days* (12) is a collection of lively stories of and for children.

Of poetry we have several volumes of various merit. Mr. Piatt (13) has at least one qualification denied to and hardly desired by a considerable number of modern verse-writers—he means something, small or great, and can express his meaning in good English. Mrs. Whitman (14) belongs to the opposite school, which finds in obscurity a substitute for care and labour, and mistakes vagueness for sublimity and darkness for depth. Mr. Washburn's verse (15) is for the most part light and not ungraceful; and the same may be said of Miss Celia Thaxter's *Drift-Weed* (16). *Genevieve of Brabant* (17) is a long romance in verse, elaborately got up and illustrated. Mr. Wendell Holmes's *Schoolboy* (18), read at the centennial celebration of Phillips's Academy, Massachusetts, 1878, is got up with equal elaboration, and with superior taste and skill. For the merits and quality of the verse the name of an author so familiar to most English readers is a sufficient voucher. *Iris* (19) is another romance, in this case of domestic life and true love. *Mother Goose's Melodies* (20), a collection of nursery rhymes familiar and recondite, is executed in the average style of Christmas gift-books, with illustrations whose defects of artistic merit will be compensated in the eyes of the young readers for whom the work is intended by their brilliancy of colour and comic expression. Some of them look as if intended to caricature Mr. Whistler's "symphonies" and the artistic furniture so popular at the present day.

MARSHAL MACMAHON'S RESIGNATION.

PERHAPS the most remarkable fact about Marshal MACMAHON's resignation is the calmness with which the news has been received in France. There was a time when the announcement would have caused a panic on every Exchange in Europe, and made French stock an almost unsaleable security. It cannot even be said that the catastrophe was known so long beforehand that there was time to discount its significance. The news came upon all, except the few who were in the secret, with remarkable and startling suddenness. M. DUFAURE's resignation had taken up so much attention that few persons had troubled themselves about the MARSHAL's. At the utmost it was supposed that he would go if M. DUFAURE went, though even this had lately come to be disbelieved, and the latest theory of the MARSHAL's attitude attributed to him a philosophical readiness to accept any Ministry which the Chamber might give him, and any policy which his Ministers might give him. The public feeling, now that he has really resigned, resembles what we may suppose to have been entertained by the relatives of the often-quoted boy when he was eaten by the wolf. Their surprise that he should at last have had a real cause for crying out must have been mingled with satisfaction that he was not there to cry out any more. Marshal MACMAHON's resignation has been so often hinted at that it had finally come to be accepted as certain that he would stay in office till 1880. The real wonder is, not that he should have gone now, but that he should not have gone earlier. He was not elected to fill any such commonplace post as that of a Constitutional President, and his taste for the work did not grow greater as he became more familiar with it. The MARSHAL's ideas of duty are perfectly genuine, but they are also exceedingly limited; and it was only natural that they should carry him no further than the conviction that he had been made President to do a particular piece of work, and that, as soon as it became clear to him that it was beyond his power to do that work, his business was to resign office. We shall know some day why he did not take this straightforward course on the 13th of December, 1877; but, whatever may have been the motive which stood in the way, the events of this week show plainly that he has never really accommodated himself to the new order of things.

The particular matter on which the MARSHAL has finally parted company from the majority of his countrymen is precisely one of those technical questions which no doubt have always worn an exaggerated importance in his eyes. About principles the MARSHAL has never greatly troubled himself; but about persons he has always been ready to take sudden alarm. Probably if the whole administrative staff of the Government had genuinely accepted the Republic, Marshal MACMAHON would have been perfectly willing to accept it also. But when the administrative staff had to be changed, and the names with which he was familiar had to be replaced by new ones, his constitutionalism was subjected to a much harder trial than it had yet undergone. If the majority could have omitted the army from their programme, it seems that the MARSHAL would once more have yielded. But the more opposition the MARSHAL offered to the proposed changes in the great military commands, the more the majority were bent on effecting them. In part this determination was possibly due to the fear that, if the troops were left under the command of generals known to be hostile to the Republic, they might at some time or other be employed to its detriment. A simpler explanation, however, is that the majority felt that, so long as the MARSHAL was allowed to reserve to himself any powers independent of his Ministers, his constitutional principles had not been properly tested. It did not matter how limited the sphere of his reserve might be; the essence of a constitutional President was that there should be no reserve at all. It is highly likely that one reason why M. DUFAURE offered so stout a resistance to the demand for sweeping dismissals in all branches of the public service was his conviction that the limit of the MARSHAL's pliability would be reached the moment that the MINISTER of WAR came in with his contribution to the list. So long as the event of Thursday was still in the future, this was a very reasonable view to take. M. DUFAURE may naturally have thought that no serious harm could now come of having concealed Royalists or concealed Imperialists in the public service, whereas very great harm might conceivably come of the MARSHAL's resignation. Holding this opinion, it was natural for him to dismiss as few officials as possible, and to be as long as he decently could about dismissing those whom he had no hope of retaining. The attitude of the majority a fortnight ago convinced him that it was no longer open to him to maintain this attitude. There were some dismissals which the Left were prepared to exact at any cost, and M. DUFAURE rightly held that a popular demand which was not unreasonable in its own nature could not be permanently resisted merely because it was opposed to the wishes of the PRESIDENT. After accepting the order of the day expressing confidence in the determination of the Cabinet to get rid of officials who had compromised themselves by using their position under the Republic to advance interests which were not those of the Republic, M. DUFAURE had but one thing to do, and in doing it he very soon discovered that, though the MARSHAL had swallowed more than one camel, he was as ready as ever to strain at a gnat. Though he had abandoned his advisers of the 16th of May, and had consented to remain President under the most opposite conditions possible to those under which he had originally accepted the office, he would not sign the decree relieving of their functions some half-dozen commanders who had already held their positions for more than the statutable period. There is nothing really surprising in this apparent inconsistency, for the MARSHAL's virtues have always been those of a soldier rather than of a statesman. At last, however, the time had come when the country demanded civil as well as military excellence in its chief magistrate. The PRESIDENT had refused to be guided by a vote of the Chamber or by the advice of the Cabinet, and M. DUFAURE was consequently compelled to point out to him that, under these circumstances, neither he nor his colleagues could any longer retain office. Whether at this critical moment any one was found to advise the MARSHAL to accept the resignation of his Ministers and to leave the Chambers to find their own way out of the dilemma which would thus be created does not appear; at all events the MARSHAL had the good sense not to listen to any such counsels. In a straightforward and dignified Message he conveyed to the Chambers his resolution not to remain President when to do so involved consenting to measures which he deems contrary to the interests of the army, and consequently to those of the country. The predictions of evil which have

been so freely hazarded with regard to the consequences of the MARSHAL's resignation have as yet been signally falsified. In little more than three hours from the reading of the MARSHAL's message the two Chambers had met in Congress, and had elected M. GRÉVY President of the Republic.

The calmness with which this great crisis has been passed through is the most striking evidence that has yet been given of the stability of the new institutions in France. For some time after Marshal MACMAHON became President, it used to be considered that the election of his successor would plunge the country into the most disastrous confusion. The MARSHAL was the sole breakwater that could withstand the conflicting tides of personal ambition and party passion. If any section of the French public still cherish this view, the incidents of Thursday must have gone some way to disabuse them of it. Nowhere could the election of a chief magistrate have been more quietly conducted. The Left were for once conscious how much depended on their calmness. It is not, however, to the immediate crisis that the need for calmness will be restricted. It has been proved that the transfer of power from one President to another is no necessary occasion of disturbance; it has still to be proved that the sense of triumph natural to men who have just gained so great a victory is equally consistent with the moderation and self-restraint without which the fruits of victory cannot be harvested. These qualities will very shortly be put to a decisive test. All that the party against whom the attempt of the 16th of May was directed can reasonably desire has now been obtained. It has been shown how completely the authors of that movement mistook the feeling of the country, and how capable the country was of asserting its real wishes in contradistinction to those which were falsely attributed to it. The last survivor of that misguided attempt has now passed from the official stage, and with his retirement the animosities with which the 16th of May is associated may well be buried. The prosecution or the abandonment of the impeachment of the Duke of BROGLIE and his colleagues are the alternatives between which the Left have now to make their choice; and it would be difficult to overrate the gravity of the issues which hang upon the result.

THE ZULU WAR.

THE Zulu war which has probably by this time begun is a not inconsiderable addition to the many troubles of the present time. There is no reason to doubt of ultimate success. Lord CHELMSFORD, who is believed to be a skilful and vigorous commander, disposes of 20,000 men, including a considerable regular force. Some anxiety is expressed as to the efficiency and fidelity of the native levies; but it must be assumed that those who are best qualified to judge have reason for trusting them. The QUEEN's troops alone could easily dispose of the Zulu army if they could meet it in the open field; but CETEWAYO will probably take advantage of superior knowledge of the country to harass the invading force by guerilla warfare. The operations against his insubordinate chief SECOCOENI have not been brilliantly successful; and native enemies probably derive confidence from the defeat of the Transvaal burghers immediately before the English annexation of the territory of the Republic. It would not be safe to rely on the energetic co-operation of the Government of the Cape, although it is wholly for the sake of the South African colonies that the Imperial Government undergoes a certain risk and a considerable expense. Natal is more immediately interested in breaking the Zulu power, especially because the native inhabitants of the colony are of the same race and language. The people of the Transvaal, who are in a sense principals in the contest, are probably not yet reconciled to English sovereignty. They have never fully acknowledged their own inability to resist the Zulus, and some of them are naturally dissatisfied with the impartiality of Sir BARTLE FRERE's boundary award. The brunt of the war will be borne by the regular troops, but there is reason to hope that the native auxiliaries will be serviceable, and among the colonial volunteers some will probably distinguish themselves by intelligence and enterprise. The best proof of the necessity of the war is the determination of Sir BARTLE FRERE to reduce the Zulu KING to submission. The HIGH COMMISSIONER probably satisfied himself that a collision was inevitable, and he determined to begin the struggle when his own force was unusually large.

One of the main causes of the war is the annexation of the Transvaal. CETEWAYO, on succeeding a few years ago to his father PANDA, thought it expedient to acquire military reputation by war with some of his neighbours; and constant frontier quarrels with the Dutch settlers seemed likely to furnish him with a pretext for hostilities. At the same time he courted the friendship of the Government of Natal, which had, at the request of the Zulu chiefs, concurred in his elevation to the throne. He probably relied on the jealousy of one another which may have been entertained by the English and the Dutch; and he may perhaps not have appreciated the sympathy which nevertheless unites the white races when any of them are threatened by savages. The influence of his English allies had, down to the time of the war between SECOCOENI and the Transvaal, restrained CETEWAYO from an open rupture with the Republic, and he was even induced to refer the delimitation of the frontier to the arbitration of the Lieutenant-Governor of NATAL; but there can be little doubt that he would by this time have invaded the Transvaal if it had retained its independence. Although by the annexation the Colonial Government became to a certain extent a party to the dispute, the arbitration proceeded; and the award lately published by the LIEUTENANT-GOVERNOR forms one of the grounds of war, although, if it stood alone, it might perhaps not be unsatisfactory to the Zulu KING. He has never relinquished his scheme of acquiring for himself military reputation; but he has hesitated to commit himself to a struggle with the English power. The military organization which forms the Zulu constitution is exclusively adapted to purposes of war and conquest. It was by turning all his subjects into soldiers that PANDA formed an independent and conquering State; and his son perhaps dimly understands that it will be difficult to reign in peace over a tribe which is only disciplined for war. Other dominant military castes have ruled over subject races. The Spartans were served by Laconians and Helots; and the Mamelukes of Egypt were a garrison posted in the midst of an industrious population. The Zulus appear to be the inhabitants of the country in arms. Their system of government, if it deserves the name, has neither meaning nor purpose as long as they remain at peace. It is to dissipate the cloud which incessantly threatens a storm that Sir BARTLE FRERE insists on a sweeping Zulu revolution. The ultimatum which CETEWAYO was to accept or reject by the 11th of January involved his abdication of the character of a military sovereign and his virtual submission to English supremacy.

The voluminous document which bears the signature of Sir HENRY BULWER has been composed or fully approved by Sir BARTLE FRERE. It was probably issued in the name of the LIEUTENANT-GOVERNOR, because it was his duty to make the territorial award which is now published at the same time with the proclamation. Although some of the claims of the Zulus to land are allowed, the districts which are ceded to the tribe will for many purposes remain, like the rest of the country, under English control. If CETEWAYO were once reduced to the rank of a protected chief, English or Dutch settlers might live with comparative safety in his dominions. It is perfectly certain that he will not submit if he has any hope of successful resistance. At the date of the latest accounts he was endeavouring to temporize; but Sir BARTLE FRERE has determined to bring the dispute to a crisis, and the KING has by this time almost certainly turned to bay. The demands which are preferred by the HIGH COMMISSIONER, and the alleged grounds of the war, are more fully understood by the potentate to whom they are addressed than by political amateurs in England. Perhaps Sir BARTLE FRERE might advantageously have provided against the adverse criticism to which his State paper will be exposed in newspapers and at public meetings. Indignant philanthropists will perhaps protest that a savage African chief as well as an Asiatic despot is entitled to the full benefit of the supposed rules of international law. The HIGH COMMISSIONER will scarcely be able to prove that he has scrupulously respected the rights of CETEWAYO as an independent sovereign. Thinking perhaps too exclusively of his public duty and of the interests confided to his charge, Sir BARTLE FRERE has not digressed

into a personal vindication of his motives and conduct. His true apology is that he must provide for the safety of the colonies, even though it may be necessary to assume a right of acting beyond the frontier. The Zulu army can choose its own time for the war which is the only intelligible purpose of its institution. Sir BARTLE FRERE has resolved to take into his own hands the choice of time and place, and he also determines to disarm his adversary instead of merely parrying his attack.

The offences actually committed by the Zulu KING and his subjects are not much more serious than the outrage which, according to ARISTOPHANES, aroused the thunder and lightning of the Olympian PERICLES at the outset of the Peloponnesian war. Two girls had then been carried off from Megara. Two refugee Zulu women have in like manner been seized by an armed band within English territory; and, after being grossly ill used, they are supposed to have been killed. The HIGH COMMISSIONER demands in satisfaction the surrender of the culprits, and a fine of several hundred oxen. Another outrage is estimated, liberally enough, as equivalent to a penalty of one hundred oxen. It seems that two white men were stopped by fifteen Zulus, and detained for an hour and a half. It is not easy to understand why reasons so trivial should be alleged for grave measures which are founded on entirely different considerations. In the serious part of the ultimatum the LIEUTENANT-GOVERNOR reminds the Zulu KING of the circumstances of his accession. On the death of PANDA the principal chiefs expressed a desire that his successor should be "a son of the English Government." In complying with their request the Governor of NATAL stipulated for a promise equivalent to a coronation oath on the part of CETEWAYO, that he would practise some of the elementary rules of civilized justice, and especially that accused persons should be tried before they were executed. It was easy to foresee that the pledge would not be redeemed. CETEWAYO is in the habit of destroying villages against which he thinks that he has any cause of complaint, without inquiring too elaborately into the guilt or innocence of the inhabitants. As far as he has violated engagements with the English Government he gives occasion for remonstrance, but scarcely for war. His real crime consists in maintaining for wholly offensive purposes an army of 40,000 men, which apparently includes all his male subjects. It would seem that there is no hope of escape from military service, for some of his regiments are composed of men of fifty or even sixty years old. No man is allowed to marry without express permission from the KING, who ordinarily withholds the boon till the applicant is past forty. An astute neighbour who might desire the extinction of a troublesome clan would rather encourage than discountenance forced celibacy. The HIGH COMMISSIONER nevertheless demands freedom of marriage for the Zulus, and the immediate disbandment of the army. Independent savages cannot be allowed to be a standing nuisance to their neighbours. CETEWAYO is informed that he must admit an English Resident, that he must administer rational justice to his own people, and, generally, that he must cease to be a bloodthirsty barbarian. All these demands are morally justifiable, and even laudable, though they may have few precedents in international jurisprudence.

BANKRUPTCY LAW.

THE memorial to the PRIME MINISTER urging the enactment of some new law of bankruptcy free from the glaring defects of the present system shows an imposing array of names. The leading banks and the leading mercantile firms of the City concur in the memorial, which is couched in very strong terms. On the eve of a Session, and at a time when the Government is known to be meditating one more of the numerous, but hitherto abortive, attempts to deal with this very difficult subject, this will have two very useful effects. It will justify the Government, if any justification was needed, in making a Bankruptcy Bill one of the principal measures of the Session, and in allotting the time necessary for its full discussion; and it will also stimulate those who have to frame the Bill to make it as good a Bill as they can devise. The CHANCELLOR, and those whom he may summon to consult with him, now know that what they may propose is eagerly expected, and that, if their proposal is sound and practical, they will gain the great credit they deserve. Hitherto the bankruptcy projects of the CHANCELLOR have been treated with almost equal indifference by himself, by Parliament, and by the public. From public motives, and prompted by the sad experience of the working of the present system which he has acquired in the discharge of his judicial duties, he has tried for three years running to pass a measure which may be adequate or not, but which has never had to stand the test of criticism. No one would look at or think of a Bankruptcy Bill. It is indeed one of the most wearisome and uninviting subjects that can be discussed, and probably, even if the CHANCELLOR had passed his Bill, he would have got little thanks or credit for it. Now the state of things in which a Bankruptcy Bill which the Government really means to pass will be presented is totally different. Recent events have made the topic of commercial frauds and commercial failures not only a matter of public interest, but a matter of ordinary everyday conversation. A discussion of a Bankruptcy Bill has come to seem as natural as a discussion on the French political crisis. The general assurance that the subject is one of national importance is greatly strengthened by the fact that its importance has been solemnly pressed on the Government by the very highest City firms. It has hitherto been considered rather beneath the level of such firms to seem to take any interest in such a poor, humble, shabby thing as insolvency. No one can now pretend to look down on a matter which appears to have kindled Messrs. GLYN and Messrs. BARING into a strain of indignant eloquence. The Government will be sure that, if it presses a Bankruptcy Bill forward, Parliament and the country will wish to see it pressed forward, and thus the resistance of indifference, which is the strongest of the adverse influences which the promoters of a Bankruptcy Bill have to fear, will have been removed.

But no memorials from eminent merchants and no earnest expectation of the public can diminish the very great difficulties which the conception and drafting of a good Bankruptcy Bill inevitably present. There are three lines on which a Bankruptcy Bill may be framed. The State may take all the proceedings into its hands, or it may leave them to the creditors, or it may divide them between itself and the creditors. But before an attempt is made to decide on which of these three lines a Bill is to be framed, it must be kept in view that proceedings in bankruptcy fall under two quite distinct heads. There is the treatment of the bankrupt, and there is the realization of his assets. The offer of the State to the bankrupt is that he shall be cleared from past liabilities if he does certain things in the present, and has not done certain things in the past. He must make such disclosures and supply such information as will ensure his creditors getting all that can be got for them, and will also ensure that none but valid claims are satisfied. In the past he must not have acted very recklessly or fraudulently. He must not have obtained goods for which he knew he had no hopes of paying, and he must not have made away with property which he knew really belonged to his creditors and not to himself. If he is evasive in the present, or has been deceitful in the past, not only is he not to have the benefit of escape from liabilities, but he is to be punished for disobedience to the law. Here the difficulty is not to determine his duties, to define offences, and to award punishment. What a bankrupt ought to do, and what he ought not to have done, has been determined with sufficient accuracy. If the law needs any emendation in this respect, it can easily be amended. The difficulty to be faced is the difficulty which besets so large a portion of English criminal law—who is to set it in motion? who is to unmask a bankrupt, or see that he is properly punished? Justice, again, has to be done to the creditors, not only in getting in money for them, but in seeing that no creditor gets more than he ought to get, that there are no fictitious claims admitted, and that the tendency in human nature to state claims at double their real amount is repressed. Here, again, it is easy to lay down the principles on which the law will be administered, and to create a court for its due administration. But who is to set the court in motion? Who will trouble himself to contest fictitious claims, or to cut down real claims? The first task of the legislator is therefore to lay down the law with regard to bankrupts and their creditors, and to provide for the law,

when necessary, being set in motion. His second task is to secure the realization of the assets, and the prompt distribution of what comes to the creditors. That the money should be got in quickly, that it should be divided immediately, and that the process should be attended with as little expense as possible, is the aim of the legislator, But it is a very difficult aim to secure. Whoever may have the task of the realization and distribution of the assets confided to them must necessarily start with two disadvantages. The affairs of a bankrupt are apt to be of a perplexing and intricate character—for a man who is getting into difficulties generally quits the region of clear and simple transactions—and they start knowing nothing of these affairs, and have their lesson to learn painfully and by degrees. They, too, and those whom they employ must take a great amount of trouble, and some one is sure to ask to be paid for this trouble. Bankruptcy proceedings cannot therefore be made to go on very quickly or very cheaply. The utmost that can be secured is that they shall go forward as quickly and at as slight a cost as an experienced person would pronounce reasonable.

It is the peculiarity of the present bankruptcy law that it does not fulfil any one of the purposes which a good law would fulfil. It does not set the law in motion against the fraudulent bankrupt; it does not ensure in the slightest degree that fictitious claims shall be rejected or real claims cut down. The assets are got in at the greatest possible expense and with the greatest possible delay, and years may pass away before the money that is got in is distributed among the creditors. The State leaves the whole proceedings to the creditors. The creditors and the bankrupt arrange everything between themselves. It can do the creditors no good to hurt the bankrupt. He may go unpunished, and may start again in life as soon as he likes, for all they care. So for him everything is made pleasant, and for many men an occasional bankruptcy is nothing more than an ordinary, innoxious, and very temporary interruption of their career. The realization of the assets is managed by a firm of solicitors and by trustees appointed by the creditors. If the trustees happen to be zealous, competent, and vigilant, they get in the assets as quickly as they can, and divide the money when they get it. But it is a nuisance to be a trustee, and trustees are apt to be indolent. They therefore leave everything to the solicitors, and the estate is eaten up with costs. If the trustees are also unscrupulous, they retain in their hands the sums which they might divide. The creditors are, as a rule, indifferent to what they consider a bad debt; they have no means of acting together; and they are content to put the bankrupt and his estate out of their thoughts, and to leave the solicitors and the trustees to manage matters as they please. The bankruptcy laws, which were originally intended to punish the bankrupt if he deserved punishment, and to divide his assets among all his creditors, have now become a machinery for whitewashing the bankrupt without inquiry, and for dividing his assets among those who have the conduct of the proceedings. Of course this statement must not be taken too generally. There are occasions when some one is roused to just indignation by the conduct of the bankrupt, and insists on his being punished. There are such people as honourable solicitors, and also such people as vigilant trustees. But these are exceptions to the rule; and the rule is that bankrupts slide through bankruptcy like eels, and that the assets are wasted. Experience shows that the plan of leaving everything to the creditors will not do. Experience also has shown that to leave everything to the State will not do, at least in the shape in which the interference of the State used to be applied. But, as the State must take a part in the proceedings—for nothing but the intervention of the State can set the law in motion against the bankrupt—the real question is how far this intervention shall extend. Let us assume that the first object of a bankruptcy law has been secured, and that the State supplies a machinery for setting the law in motion. It has then to be asked how the assets are to be realized? The creditors, acting through their solicitors or trustees, cannot be trusted or cannot manage to do this with the certainty, the promptitude, and the cheapness which the mercantile community has a right to expect. Therefore the State must again intervene; and it may intervene in one of two ways. Either it may supply a special machinery of its own, a machinery of a totally different character from that which it offers as a guarantee that the law will be set in motion, a machinery efficacious for the peculiar purpose of dealing with assets. Or else it may supervise the proceedings of the representatives of the creditors, leaving solicitors and trustees to manage, but cutting down costs, watching what is done, ordering promptitude, and removing those who do not do their duty. The new Bill must proceed in one of these two directions. The memorial of the merchants leans to the former alternative. The CHANCELLOR is understood to lean to the latter. When his new Bill is submitted to Parliament the respective advantages of the two systems will be sure to be fully discussed, and the public will be able to judge between them, and at any rate will have an opportunity of understanding the very great practical difficulties which beset the adoption of either one or the other.

MR. GLADSTONE'S LATEST CONFESSIONS.
